As manager of the forthcoming International Flower Show, I appeal to my fellow gardeners for their co-operation and support in making this show a great success. All the preliminaries have been arranged with one single purpose, which is to make this show larger and better than any that have preceded it. No more liberal nor more comprehensive schedule for a spring show has ever been arranged. The trade fully realizes the importance of the event and will do its part.

We specially need the private gardener with exhibits large or small according to the facilities at his command. The classes for private gardeners are most extensive and varied and some of them offer a splendid opportunity for originality. For example, in Section A, there is a class for a "Group of flowering plants and bulbs (orchids excluded) arranged for effect covering a space of 200 square feet." First prize, \$150; second prize, \$100. This class could be made one of the features of the show. Will you do it?

Everything available at this season appears to have been provided for with premiums of unusual liberality, but our efforts along these lines are in vain unless there is the response of large exhibits to make the show a real success.

Surely there is no better way than this to advance the profession and spread the love of gardening.

ARTHUR HERRINGTON, Manager, International Flower Show.

#### A SUBSTITUTE FOR NORWAY SPRUCE.

The general decadence of Norway Spruce plantations, so visible in the proximity of our older cities, calls for the substituting of some other evergreen for uses for which the Norway was formerly employed, writes Joseph Meehan in Florist Exchange. Wherever one finds a line of Norway Spruce, planted, say 50 years age, oftener than not the trees are in a deplorable condition, half dead, many of them, and hardly one in the line a vigorous, pleasing appearing tree. This is not only true of trees so near cities that smoke and gases cause it; trees far from such influences are to be found as ill-looking as those close to cities. But a few days ago, passing along a highway bordering a large estate, the writer saw a long line of evergreens in two rows. The row nearest the highway consisted of Pinus Strobus, the White Pine. These were in excellent condition. Behind them was a row of Picea excelsa, the Norway Spruce, and the condition of these trees disgraced the place. From appearances both these and the White Pines had been planted at the same time.

The beauty and general worth of the White Pine is well known; its silvery foliage is much in its favor; but at the present time, thinking of a tree of dark green foliage and of the habit of growth of the Norway Spruce, there is nothing so near it as the Douglas Fir, Pseudotsuga Douglasii, our old Abies Douglasii. There are now specimens of this tree on many of our lawns which have reached a height of 40 to 50 feet, and which in character remind one of the Norway in their outline, but are less rigid of branches, and the foliage is of a softer texture.

Wherever planted this evergreen has given great satisfaction, pleasing from its earliest years. It is easily procured, as it seeds freely, and seeds germinate well, while for rapidity of growth it has no equal among evergreens.

There are two varieties of this, the Douglas Fir. One extends along the Pacific Coast from Alaska to California and inland to Montana and Idaho, while the other is found in Colorado and New Mexico. It is this wide range of territory that permits of its use in all parts of our country. Where winters are not severe, the Pacific Coast variety can be used; the Colorado one in the coldest States. In eastern Pennsylvania either kind can be used, but it is safer to rely on the Colorado. There is little difference in them. The Pacific variety makes rapid growth, and has very dark green foliage; while the Colorado one is also fast growing, it is not so fast as the other, and its green color is not so intense. But it is a lovely tree; and whichever variety is planted, there is no doubt more satisfaction would result from the setting of the Norway Spruce.

#### TREES IN WINTER.

Lealless trees are by no means uninteresting, neither are they the liteless things they seem to be. Even when trest gaps the earth and all vegetation seems at a standstill, trees are actively alive. Far down in the earth their roots are taking up nourishment, and when the mild days come this "lifeblood" is carried up through trunk and branch, ready to renew the annual miracle of leaf and bloom and fruit. The leaves fade and die, but the tree lives on. The winter time period of apparent death is really a period of rest and resuperation.

To the lover of trees there is much to admire and interest during this resting time. The rare beauty of the spring and summer and the brilliant glory of the autumn is lacking, but the strength and rugged majesty of trees are all the more in evidence when their branches are leafless and bare. Singly or in groups trees are a most important and interesting element in the winter landscape, and afford constant protection and comfort about our homes. Realizing this the careful tree owner and landscape gardener never relaxes his care and vigilance at any season of the veer

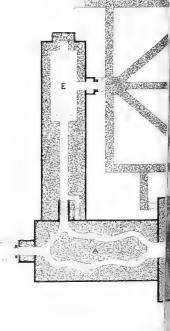

In spite of the height and breadth of the roof span, so skilfully and attractively was the frame work worked out, that the structural parts became ornamental. This, to our nction, is architecture at its best.

TITHIN the environs of Paris, is the wonderful cemetery of Pere Lachaise. Here lie many characters famed in history and art.

Of all the graves and tombs visited by countless thousands each year, none is frequented quite so much as that of Abelard and Heloise, the world's famous lovers. Separated in life but united here in death; they stand for the love there is

in Humanity.

In the Missouri Botanical Gardens at St. Louis, is a choice grove of trees, in the midst of which is a beautiful classic structure of stone.

A construction classic handling, this entrance is well worth careful consideration. From any point of view it a impressiv

Front View. If you would see an entrancing sight, come here some day just at sunset, when the sky colorings and the beautiful lines of the building are mingled in the pool's reflection.

Soothed by the babble of the brook; over the bridge into the landscape of ferns we come.

Another view of the front, showing just a glimpse of one rear house. You get a peep of the Power Plant chimney at the right.

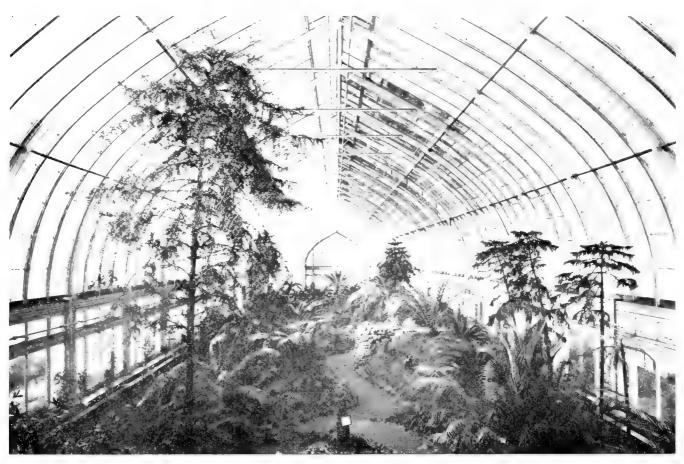

Surely here is a fern paradise. Better watch out, or the fairies may come out of the grotto and wave their mystic wands over you.

The Palm House is a fitting setting for the Garden of the Gods. In fact, I think that's exactly what it really is.

Could you have been with me in the bloom garden, when the Chrysanthemums were aglow, you would have seen a sight scarcely surpassed by any of the flower shows of the country.

Towering acacias and countless semi-tropic plants lure you on and on. With what a fund for enjoyment and information it is filled!

Nor is the truly practical side of living overlooked, for here you find a remarkable collection of the so-called "Economic Plants." Plants from all parts of the world, that contribute food for mankind. Better set aside at least a day for this house alone.

Henry Shaw. Not only did he donate his entire estate for garden purposes, but he provided for its care and development, an endowment fund of several million.

Under the advice and guidance of such famous botanists as Asa Gray and Sir William Hooker; Mr. Shaw started in 1859 to form the nucleus of a collection of trees, shrubs and flora, which today are so complete as to be like a vast outdoor library, where you can roam at your will and read the titles and brief information on each specimen.

If you have the inclination to study plant formations in all its delightful divisions, you will find in the Museum Building a wonderful Herbarium valued in the hundred thousands.

If you would be still more serious in your studies, you can go to the School of Botany at Washington University, also endowed by Mr. Shaw, as but another feature of his far reaching plan.

For years, one of the points of interest in the gardens has been the greenhouses, with their exhibits covering a sur-

prising breadth of plant representation.

As the garden grew; and that part immediately facing Floral avenue was brought to its present beautiful formal floral expression; the inadequacy of the old greenhouse became glaringly evident.

And so it was that the Pierson U-Bar Company, of New York, was given the contract to build a horticultural building, which should, beyond all argument, surpass anything of its

kind ever erected.

Not only does it surpass in breadth of conception, but in its classic architectural interpretation.

Located as it is, on a rise of ground, you catch alluring glimpses of it from practically every approach.

The effect is particularly beautiful as you come up Floral avenue and pass through the main entrance.

So imposing—so extensive is it, as to be awe inspiring.

You find yourself viewing it from different locations, in an endeavor to grasp the fulness of its conception. You strive to form an opinion of which is the most pleasing—the view of its Athens Temple-like entrance of majestic columns, reflected entrancingly in the water; or the rear with the expansiveness of the big wing houses and their accented architectural effects.

Finally you give it up and come to the conclusion that to fully grasp its beauties, you must see it again and still again. So you temporarily surrender and enter the big central house, with its graceful glass roof, arching high above you.

Outside, you left the trees leafless; in here you are suddenly transported to the tropics with its wondrously luxuriant growth.

You wander down palm lined walks. You start by reading the names of the specimens, but are finally overwhelmed and conclude to just walk through this time and promise yourself later on, the joy of countless visits to "really see things."

From the garden of the tropic, you pass across a bridge to a fern landscape, where there are hills and dales, grottoes and even a babbling brook. From above, are hanging ferns

and pendulous vines.

Here you linger until the lengthened shadows tell you that the afternoon is nearly spent. But still you linger. The soft light of the fading day brings out unthought of beauties. You feel very content, very grateful for the lengthened shadow of this big broad-minded man Shaw.

You, however, finally hurry to the other wing house and take a hasty glimpse at the garden of blooming flowers; and come away leaving the fulness of that joy for another day.

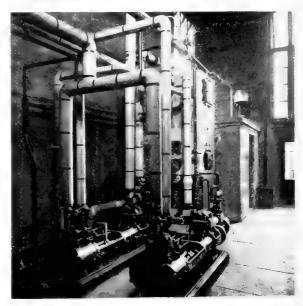

And so you pass out the massive main entrance, across the sleeping formal garden, through the gateway and down the avenue.

You glance back; and in the shadowy twilight mist, the building ceases to be glass. It resolves itself into a wondrous Temple to Flora—a vision from those days of the ancients when civilization was at its highest and art at its supreme pinnacle.

And you feel greater than ever, just how great is this lengthened shadow.

The heat is supplied by three 205 horse power Heine Safety Boilers. The chimney is 60 feet in diameter at the bottom and 100 feet high.

The heating is done by the vacuum system. This shows a glimpse of the pumps with feed water tank at back,

A tunnel cornects the Power Plant with the greenhouses. In addition to carrying the heating mairs, it forms a means of inter-communication and is large enough to run a cart through.

No. 2.

Is gardening superseding the tango, bridge whist and pink teas? If the increase in garden clubs and the popularity of horticultural lectures in society circles are to be accepted as a criterion it would seem so.

The past season has witnessed material growth in garden clubs throughout the country and the demands for lecturers on horticultural subjects have never been so marked as during the present winter months.

Illustrating the interest manifested in horticulture among society folks, at the present time a benefit is being promoted for welfare work in New York City which comprises a series of subscription lectures on horticulture to be delivered by one of our prominent amateur gardeners.

It has become quite a fad in suburban communities to provide entertainment, at morning and afternoon home socials, in the nature of a talk and general discussion on gardening or on a specific subject relating to it. This is not confined to country homes, for many of these lectures have also been given in the homes of prominent people and some of the leading clubs and lecture rooms

of colleges in New York City during the fast few months, all of which have been well attended by interested audiences. 1 🛴

It has been remarked by those in close touch with the progress of horticulture in this country that it is still in its infancy and that a wonderful future awaits it. Everything indicates that our people are beginning to realize that great pleasure that is to be derived from working in the garden. Certainly no more elevating recreation can be chosen than that of coming in close contact with nature. It invigorates the mind and the body.

Horticulture has its diversified interests, represented by distinct classes, which enumerated, are as follows: The commercial grower, the private or professional grower, or gardener, and the amateur gardener. It is not so long ago that the amateur was regarded among the professionals somewhat in the light of an intruder, but it is not so today. It is not now uncommon for the professional and the amateur to meet in competition at some of the flower shows and for the amateur to learn that for the production of "exhibition blooms" he must enlist the services of the professional gardener, and, so, we frequently find him graduated from the ranks of "amateur grower" to a full fledged "exhibitor."

The amateur should be encouraged. (Many of them have found their first joy of the garden in a small plot.) He plods in the garden for a few sensons, becomes an enthusiast, acquires more ground—and employs a "garden laborer." He directs and works with his "gardener," but he cannot produce the quality of his more successful neighbor. He becomes discouraged and disgusted, and, finally realizes that horticulture is an acquired profession—that one may occasionally successfully specialize in but that the general up-keep of a well conducted country estate requires the services of a real gardener.

# NATIONAL ASSOCIATION OF GARDENERS

JOHN W. EVERITT, President, Glen Cove, N. Y.

OFFICIAL COMMUNICATIONS

M. C. EBEL, Secretary, Madison, N. J.

#### ASSOCIATION NOTES.

The National Co-operative Committee which has undertaken to provide some study courses for members of the National Association of Gardeners, who are not in position to avail themselves of college courses, is busily engaged in working out the details and trusts to be able to report its plan in the April issue of the official organ. Much detail is entailed in the working out of the plans, but the institution with which the committee is negotiating trusts to have some of the study courses ready to submit to the committee within the next few weeks for its approval,

The Essay Committee, which has charge of the president's contest for the best essay, to be submitted by a head and an assistant gardener, will report its plan for the competition in the next issue of this publication. It intended to do so in this number, but, as the committee is so scattered, the working out of the details of the competition has taken more time than it would have ordinarily required.

President Everitt, in response to an appeal that the National Association of Gardeners interest itself in the preservation of our native birds, has appointed the following committee to take up this work; L. P. Jensen, St. Louis, Mo.; David F. Roy, Marion, Mass.; Lester E. Ortis, Bernardsville, N. J.; Robert Williamson, Greenwich, Conn.: Frank R. Kuehne, Lake Forest, Ill.

Bills for 1915 dues have been sent out. The books show quite a few delinquents. Some have reported that, owing to the depressed conditions, reduction of salaries, etc., they find themselves unable to pay up their delinquent dues at the present time. These have been advised that if they will remit at least part of their indebtedness they can retain their good standing in the organization until such time as they can make up their deficiency. The Executive Committee deems it advisable, for the good of the association, to enforce the By-Laws, relative to members in arrears for dues, and will not modify its decision where a member does not show an inclination to meet at least part of his obligation to his national organization. Members in arrears will kindly make note of this.

# AMONG THE GARDENERS

#### THE GARDENERS' REUNION.

As chairman of the committees which have had charge of the annual gardeners' reunions in New York City for several years past we have decided not to hold a reunion this year, and to suggest to the gardeners who usually attend this annual event that they contribute the amount their tickets would cost to one of the relief funds for the poor of this country or for the war sufferers abroad. As there is so much suffering both at home and in European countries, we believe that the gardeners should abandon their reunion for this year and contribute their mite to suffering humanity which they would have spent had they attended our annual reunion.

With the European war at an end and with general conditions much better at home, which we hope will be the case a year hence, we can doubly celebrate at a reunion then.

J. W. EVERITT JAMES STUART.

William H. Waite, formerly superintendent of the Untermyer estate, "Greystone," Yonkers, N. Y., has accepted the position of superintendent of the E. D. Adams estate, Oceanic, N. J., succeeding George H. Hale, who resigned recently.

Jos. J. Krupa, for some years in charge of the N. H. Harris estate, Lake Geneva, Wis., resigned his position on February 1. A. P. Montgomery, formerly located in Massachusetts, succeeds him.

John J. Huss, superintendent of the J. J. Goodwin estate, Hartford, Conn., has been selected to take charge of the famous rose gardens in Elizabeth Park of that city.

Porter, formerly superintendent of the S. T. Bodine estate, Villa Nova, Pa., has secured the position of superintendent on the estate of Percival Roberts, Narberth, Pa.

Harold V. Vyse, for a number of years superintendent of the A. R. Whitney estate, Morristown, N. J., which position he lost some months ago due to a change of ownership of the estate, has been appointed superintendent of the S. T. Bodine estate, Villa Nova. Pa.

Robert Heggie, formerly of Chestnut Hill, Mass., is now located at "Elmhurst," Bath, Me.

Edward Brett, son of Richard Brett, Islip, N. Y., has accepted a position to go West, entering the employ of MacRorie-McLaren Company, San Mateo, Cal.

William Miller has resigned his position as gardener at Rocky Point, Plymouth, Mass., to accept a similar position on the estate of Mrs. E. H. Roberts, Bryantown, Charles County, Maryland.

F. T. Edington, former superintendent of the Arnheim estate, West End, N. J., has accepted a similar position on the E. C. Brown estate, Copake, Columbia, County, N. Y. Considerable improvement work on this place is contemplated during the coming

James Stevens secured the appointment of superintendent on the estate of Mrs. William Arnold, Babylon, N. Y. He enters his new position on March 1.

William Brown, gardener on the John D. Rockefeller estate, Tarrytown, N. Y., recently resigned his position there.

James Hamilton, formerly head gardener at Brigham Hali, Canandaigua, N. Y., has accepted the position of superintendent on the estate of Mrs. J. D. Adams, Bay Shore, N. Y.

"The many friends of William S. Rennie, of Ross, Cal., are gratified to hear that President John W. Everitt, of the National Association of Gardeners, has appointed him a member of the 

William Anderson, on the Bayard Thayer estate, South Lancaster, Mass., has one large house planted with Camellias. He is going to devote a special house to Acacias; some will be planted out, others grown in tubs. No less than 50,000 Scotch heather raised on the place have been planted out during the past two

The Boston Spring Show and meeting of the American Rose Society, March 18 to 21, will bring out a splendid show in Boston, but it will keep many from visiting the New York Show, which opens one day earlier. It is too bad that dates could not have been separated a week.

Editor Gardeners' Chronicle:

I was very pleased to see the timely letter from Mr. Arthur Smith in your last issue relative to the possible amalgamation of the National Association of Gardeners with a trade organization. I don't know what the feeling may be in other States in regard to amalgamation, but I can say with confidence that Massachusetts gardeners, and I know a good many, are solid against any such alliance.

We have everything to lose and absolutely nothing to gain from any such amalgamation. I need not go into the reasons for opposing such a coming together of bodies whose aims and interests are on such diametrically opposite lines. They were well set forth by Mr. Smith.

# Of Interest to Estate Owners

The National Association of Gardeners maintains a Service Bureau

The National Association of Gardeners maintains a Service Burean which is at the disposal of all who long require the services of efficient gardeners in their various capacities.

The association seeks the cooperation of estate owners in its efforts to seems opportunities for those engaged in the profession of gardening who are seeking to advance themselves. It makes no charge for services rendered, It endeavors to simply men qualified to assume the responsibilities the position may call for.

Wake voir randingments brown to Make your requirements known to

M. C. EBEL, Sec'y, National Association of Gardeners, Madison, N. J.

The organization some would have us amalgamate with has of late years expressed deep concern for the private gardener and his welfare. At its convention in Boston last August it had a member in the trade prepare a paper on "Why the Gardener Should Flock to the Standard of Said Organization." I took careful note of members of the trade attending this meeting, and then totaled three. Surely this indicates a wonderful admiration for the private gardeners!

In the Gardeners and Florists' Club of Boston we have a membership of four hundred and sixty-eight, pretty evenly divided between the trade and private gardeners' interests. We voted to co-operate with the N. A. G.

Can anyone tell us what benefit would come to the N. A. G. if it ever affiliated with a commercial organization, and what good any garden club could gain from such an union? The N. A. G. needs evern encouragement and should have the whole souled support of every gardener. We can co-operate with the other organizations in the trade for the advancement of horticulture, but affiliation would mean the death knell of our own body, and surely no true gardener wants that to occur. Our interests and the interests of the trade societies are as divergent as the poles, and I hope to see a quietus put on such ill-advised union as has been suggested.

W. V. CRAIG.

Brookline, Mass,

#### A PLEA FOR THE SMALL ESTATE GARDENER.

Recently much just and unjust criticism has been directed at the small estate gardener. (Note I did not say "small gardener."). It is not my purpose or intention in this article to justify or condemn this criticism, as I wish more particularly to explain my version of one reason why the small estate gardener is solden heard from and why he has reason to become discouraged.

The fault lies, in a creat measure, in the present arrangement of classes at all flower exhibits, which make it impossible for the small estate pardener to show his products with a hope of success; in fact, he cannot show at all in most cases.

A brief outline of what a gardener with a greenhouse 100 x 25 feet has to produce will explain why.

Five thousand to 10,000 bedding plants, early cauliflower, salad, tomato plants, etc., roses in three colors, carnations in three colors, snapdragon, lilies, spireas, bulbs, hydrangeas, azaleas, cyclamen, begonias, palms, ferns, gardenias, cinerarias, primulas, daisies, genista stocks, mignonette, lilacs, callas, sweet peas, stevia, poinsedias, chrysanchemums and a few more. He also has to grow most, if not all, stock and beg or borrow anything new. Many a gardener has but four Gorgeous, six Matchless and two Champion and is growing Beatrice May for white. Furthermore, he may be allowed to grow only certain colors or kinds of flowers, etc., not called for in the various classes, as the tastes or his employers vary. These flowers are for his employer, his friends and relatives, who vie with each other in securing the larger share. To fail to produce them means the gardener's dismissal.

Now Class D calls for twelve single-stem chrysanthemums in pink. He grows twenty-five at least to select twelve. Class F calls for four varieties, four colors, six each. He grows at least fifty plants for a selection and the worst is yet to come. Class O calls for four 14-inch pots, four colors—but what's the use, "it can't be done."

The same rule applies to the Spring Show, and to classes of decorative and flowering plants, forcing the grower to grow a certain kind and color, size and number. He is a good gardener and no doubt can make "two blades of grass grow where but one grew before," but he cannot produce show stuff under these conditions with only that much glass unless he is allowed to show his products from 2.500 square feet of glass in competition with somebody else's products of 2.500 square feet of glass. Why not let your schedule of prizes include:

Class A = 2.500 or less square feet of glass. Class B = 2.500 to 5.000 square feet of glass. Class C = 5.000 to 7.500 square feet of glass.

Let these classes call for anything the gardener has to show, irrespective of color or kind, to fill a certain number of square feet of floor space; decorative abouty to count also or make smaller classes of various kinds, but governed by the number of square feet of glass the exhibitor has at his command.

With all due respect to the men whose names are familiar ones in the show ring, I make bold to say that there are many gardeners on small estates who are producing more good goods to the square foot of glass than some of them are. These men should receive credit and encouragement. They will respond, and we will have more enthusiastic workers in our societies as a result. HUGH B. BARCLAY.

[Criticisms of this suggestion are in order.—Editor.]

# OF INTEREST TO ALL

#### THE MINNEAPOLIS CONVENTION GARDEN.

On account of the large amount of annual planting material required to fill the garden, which, because of the requirements for bedding plants for other parks we are not able to furnish from our own propagating plant, it seems advisable to change the layout of the garden to provide appropriate room for a larger number of perennials and other hardly plants which do not require replacing every year.

We cannot expect outside growers to furnish large quantities of plants every year to help fill this large garden, and we do not intend to ask them to do so. We are, however, not only willing but anxious to have all growers who wish to do so, make use of those display grounds to introduce and show their novelties in large or small numbers. Exhibits sent us for that purpose will be given a conspicuous place in the garden among the class of plants to which they belong. They will be properly labeled, giving the exhibitor's full name and address. We simply ask that prospective exhibitors write to us before April 1 what they wish to exhibit, so that we may reserve space for their exhibits, and that the plants be sent, freight or express prepaid, at the proper time of planting.

Our home people are taking a great interest in the garden right along, and there can be no question as to the advertising value of an exhibit at those well-kept exhibition grounds. I therefore extend a hearty invitation to all growers and introducers of novelties and meritorious plants to make use of our garden. We will do our share to grow the plants as nearly to perfector as possible and to thus serve the interests of the exhibitors and public alike.

THEODORE WIRTH.

Superintendent of Parks.

#### A NEW BOOK ON TREES.

"Studies of Trees," by J. J. Levison, M. F. Lecturer on Ornamental and Shude Trees, Yale University Forest School; Forester to the Department of Parks, Brooklyn, N. Y., gives briefly the means of identification of the more important native and exotic trees commonly found in the States cast of the Great Lakes and north of Maryland in the United States. It describes the leaf, flower, twig, wood and habit characteristics which distinguish them from other trees; and answers besides many questions which would naturally arise in the mind of a person interested in trees, such as how large they grow; under what conditions of soil and climate do they thrive best; what are the enemies and how can they be overcome; what is their value for wood and other useful products; what is their protective value; are they useful for planting along streets and in parks and in regenerating forests; how can the trees of our streets and lawns be preserved and repaired as they begin to fail from old age or other causes?

In the preface, Director J. W. Toumey, of the Yale University Forest School, says: "The author's training as a forester and his experience as a professional arboriculturist has peculiarly fitted him to speak in an authoritative and interesting way about trees and work."

The value of the book is not in new knowledge but in the simple statement of the most important facts relating to some of our common trees, individually and collectively considered.

John Wiley & Sons, Inc., New York, are the publishers. The book consists of 260 pages, well illustrated. Price 81.60.

#### A CREDITABLE ANNIVERSARY NUMBER.

At its birth ten years ago the publishers of the Garden Magazine announced it to be "the logical working out of the growing interest in the garden as a delight and pursuit for the busy people who find a new fascination in the things of the soil."

Its tenth anniversary number, the February issue, presents every indication that it has been more than successful in its mission during its ten years of life. The contents of the Garden Planning Manual, as this sper number is described, his its pages loaded with interesting subjects for the garden lover. As its publishers say, ten years ago plants were known as "trees" and "bushes" and "flowers." Today the owner of a garden knows his plants by name and demands more scientific knowledge on the culture and habits of plant life than he did a few years ago. The columns of the Garden Magazine show that this paper has recognized the growing interest of the suburbanite, and that it is catering to his desires.

We congratulate the Garden Magazine and its entire staff on what it has achieved with its tenth anniversary number.

# AMERICAN ASSOCIATION OF PARK SUPERINTENDENTS

OFFICIAL COMMUNICATIONS.

G. S. AMRHYN, Pres., New Haven, Conn.

R. W. COTTERILL, Sec.-Treas., Seattle, Washington.

#### ASSOCIATION NOTES.

President G. X. Amrylin has called a conference of Executive Committee members and association members residing near New York City to take up the question of the fixing of the date of our San Francisco convention, which our laws leave to the discretion of the Executive Committee.

The Society of American Florists has fixed its convention dates as August 17 to 20, and it seems desirable that our convention should be held at about the same time. The matter will be definitely decided before our next issue, when an announcement will be made with suggestive itineraries.

The proceedings of the Newburgh-New York convention, after considerable delay, are now in the hands of the printer, and a copy will be sent to every member in the near future. Unfortunately many interesting discussions which took place, will not be recorded because of the fact that no stenographic report of the convention was provided for and few notes of any kind were made, hence your new secretary has had to do the best he could with a collection of edds and ends in the way of newspaper clippings, rough notes and copies of papers.

If any member has 'n mind and additions or amendments to the constitution and by-laws to present to the next convention, it is well to remember that our laws provide that a copy of any change to be proposed must be filed with the secretary at least thirty days before convention date in order that a copy may be sent to every member.

Oakland, Cal., has been added recently to our honor list of sustaining members, a membership having been taken out by the Board of Park Directors of that city. Oakland is one of the most progressive cities of the Pacific Coast, as our members who attend the August convention will have an opportunity to observe, as no doubt a tour of the Oakland park system will be made a part of the programme of the San Francisco convention. Lee S. Kerfoot, the very capable superintendent, will probably affiliate with our association at the convention.

F. L. Mulford, of the Department of Agriculture at Washington, and one of our most earnest members, has submitted to the president and Executive Committee a letter of suggestion which is worthy of consideration by the membership.

Mr. Mulford's letter is in substance as follows

"You will find enclosed a copy of a memorandum of the formation of the Park Institute of New England. This association was formed to meet certain needs I have long telt the American Association of Park Superintendents should meet, to wit: To make available to each of us and to the public, knowledge and experience arising from the methods and managements of parks and plangrounds by cities, Of course, in our annual meetings could not cover the field as this institute can in New England, but the formation of an association of this sert shows how its need is felt by the nounger men in park work.

"I know I am not alone in our association in thinking that we need just this sort of coming together, and I am bringing this matter to your attention because I feel that our association has

been on the wrong track.

"You man recall that while secretary I endeavoyed, with but slight success, to make our meetings more of a time for papers

"I still feel that the association should devote itself seriously to the presentation and discussion of topics of mutual interest. and that too much of the time of our meetings has been devoted to sociability and to tours of inspection. Valuable as these features are, they should not be obtained at the expense of meetings for discussions.

"The suggestions that I made at the Boston meeting looking to two distinct classes of membership was with this same idea in view, that the trained park men of experience should direct the affairs of the association, and that the newer men of inexperience as well as those interested in the subject from an amateurish standpoint, should have an opportunity to support the association, attend its meetings and take part in its discussions, but that the control of the policies of the association should remain in the hands of the experienced park men."

Mr. Mulford's ideas may not meet with the approval of all of our nembers, and the se reary would be pleased to become en tributions on the subject, which will be given publicity through

these columns in subsequent issues.

The organization of branch or auxiliary associations and the reduction of social features at conventions are subjects which are not new to the association, but both are worthy of serious consideration.

# PARK DEPARTMENT PERSONALS

Theodore Wirth, the genial superintendent at Minneapolis, who is certainly one of "the pillars of the church," as far as the association is concerned, is already beginning to think about the convention at San Francisco, and is urging his friends to come West via the northern route.

The Minneapolis Park Commission has a reputation for entertainment and hospitality which is well known to many of our members, and as they stand ready to repeat members Westward bound who do not put Minneapolis on their route will miss a treat. Mr. Wirth has a habit of attending conventions every other year, his capable assistant, C. A. Bossen, attending on the off year, but they are both such good members as well as such good fellows, that we hope they will break the rule this year and

L. P. Jenson, superintendent of grounds at Busch Place, St. Louis, has been spending many of his winter evenings, delivering illustrated lectures on the parks of the country before his fellow citizens, and thus arousing interest in local park development. Mr. Jenson was not with us at the New York session, the first convention he has missed in years, but states that he will sure be at San Francisco, and will have a bunch of applications from superintendents in Southern cities. Did you read Mr. Jenson's article in the January Chronicle on "The Relation of Birds to Parks"? If not, you missed something good.

George W. Hill, for many years superintendent at Tacoma, Wash., will in a future issue have an illustrated article on the park system of that wonderful Puget Sound city, which he hopes will assist members in arriving at a conclusion to go to San Francisco via the Pacific Northwest.

Tacoma has taken out a sustaining membership in the association, and can be counted upon to show a good time to those who

may visit that city.

At Seattle and at Portland you can see Mount Rainier in all its glory, but the only place in the country from which you can see Mount Tacoma to advantage is from Tacoma.

Laurie D. Cox, until recently landscape engineer at Los Angeles, has turned up at Syracuse, N. Y., where he has accepted a position as assistant professor of landscape engineering in the Now York State College of Forestry, the first institution in the country, according to Mr. Cox, to specialize on such a course,

William R. Reader, superintendent at Calgary, Canada, has signified his intention of becoming a member of the association and will probably be at the San Francisco convention.

Robert R. Moss, of Rosemont Farm, Berryville, Va., is desirous of securing an assignment as superintendent of some public park or small park system. Mr. Moss has had twenty-five years' practical experience on private places, and is ambitious to enter public service.

A circular letter of inquiry has been sent by the secretary to our members in the larger cities, seeking data regarding the operation of park concessions and methods and policies in use in dif-ferent cities. This will make a most interesting subject for a future bulletin as the problem is one which is under consideration in many cities.

J. J. Levison, former secretary of the association, forester for the Brooklyn Park Department, is the author of a recently published book "Studies of Trees." which is just about the best thing in the way of a tree book that has ever been published. No. gentle reader, this is not an ad.; just a word of tribute to an author and fellow-member who has put out something worth

If you would like to see your city, your work or yourself mentioned in these columns, just drop a few lines to the secretary and tell him what you are doing or what you have on your mind which might be of interest to other members. The secretary would be delighted to have to answer a letter from every member every month, and perhaps the correspondence might produce some chatter which would make these columns more interesting.

## DYNAMITE AS A SOIL BUILDER.

A quarter of a century ago, a fruit grower in California, in digging holes for some fruit trees, came upon hardpan which was nearly as tenacious as cement. He used some dynamite with which to break up the hardpan in order to get the holes deep enough to plant the trees at a right depth. It was discovered that the trees planted in the dynamited holes made a much larger growth, and better withstood the dry weather that followed. From this discovery a general interest has grown in this method of preparing the soil for trees.

While there are many instances where soil conditions have been improved by the use of dynamite, this does not follow with all soils, and it thus becomes important to know and to understand the distinctions, writes George T. Powell in *The Field*. In a soil that contains 65 per cent. clay, with a yellow clay loam subsoil, one-half a stick of 20 per cent. dynamite put down two and a half feet will loosen the top soil for six feet around and five feet deep. The 20 per cent, strength is better than 40 per cent., as the slower explosive leaves the soil in better condition

Dynamite, however, should not be regarded as a digger of holes for planting trees, as a properly placed tree planting charge should be tamped in to insure the maximum breaking effect of the subsoil, and this tamping prevents the excavation of a hole for planting the tree, but the shock of the blast makes excavating with a shovel easy.

It is important to follow this plan in setting out trees. After the blast, shovel out the top soil and set it to one side, then shovel out the subsoil until the point where the dynamite cartridge was exploded is reached. As a rule, a cavity will be found one to two feet in diameter; it is important that this be filled with subsoil. If the tree is planted without doing this, the subsoil will gradually drop down into the hole, leaving the tree roots suspended in the air, when the tree will die. Having filled the cavity, subsoil should be shoveled in to a point just below where it is desired to place the roots of the tree. Then put in half of the top soil. Lay the roots on this top soil in their natural position and cover them with the remaining top-soil and pack it in firmly by treading it with the feet. Then fill the remainder of the hole with subsoil.

Several effects are produced that benefit the trees planted in soil so treated. Excellent and quick drainage is provided for the roots, which is essential to their health and vigorous growth. A heavy, soggy or over-wet subsoil will retard the growth and bearing of trees by several years, as many of the fine feeding roots will perish when confined for several weeks in such soil. The breaking up and loosening of a heavy subsoil may be done much more effectively through the use of dynamite than is possible by digging holes three feet in diameter and fifteen inches deep with a pick and spade, as is usually done. The cost of digging the holes will be from two to three cents per tree, against five to six cents for the dynamite, but the dynamiting will be far cheaper when the greater growth of the trees and the less percentage of loss following dry periods are considered

The subsoil should be dry at the time of the blasting, otherwise the effect is detrimental rather than beneficial, as a blast in wet subsoil throws the dirt high in the air

and plasters it against the sides of the hole, failing to crack the subsoil as it should, several feet around the hole.

If the planting is done in the spring, it is necessary to wait until the subsoil is reasonably dry. Trees properly planted with dynamite will not die, but will grow tapidly right through the dry summer, and will bear fruit one to two years earlier than trees planted with a spade.

The next important benefit that follows from the use of dynamite is the more thorough aeration of the soil that is produced. An abundance of air in the soil is high-

ly essential to plants.

The roots of trees perform the necessary function of taking up plant food that must first be made soluble, when through the circulation of sap it is utilized in making new layers of wood, foliage, fruit buds and fruit. The oxygen in the air performs an important part in the processes going on, and in the changes which take place in the chemical constituents that are present in every grain or atom of soil, and which are necessary for the growth of all vegetation.

Where the soil is heavy, and in poor physical condition, trees are more subject to diseases that not only retard their growth, but to a certain degree make them unfruitful. Therefore, the better the soil is prepared by making it more open or porous, and capable of taking in the air freely and abundantly, the greater will be the degree of health, vigor, growth and productiveness.

Through the use of dynamite in the planting of an extensive orchard of apple trees on a New Hampshire farm of quite heavy loam soil, a very satisfactory growth was obtained the first year, which was even more pronounced the second. The soil and subsoil were favorable

for this method of preparation.

Where the subsoil is of an open or porous character, with a sandy loam top soil, the use of dynamite is not advisable, for such subsoil should not be broken. The foundation will become too loose or soft. The drainage will be made too excessive; the subsoil moisture will not be so usable or effective in its upward movement, because its medium has been broken up and changed, in consequence of which the trees will suffer severely in times of prolonged drought, and during heavy wind storms they will be blown over, for their roots will not be held by a sufficiently firm soil.

The use of dynamite is practical and economical, but careful surveys of the soil and subsoil should first be made, to ascertain whether they are suitable for the ad-

vantages to be gained by this method.

These are some of the conditions that need to be understood in the preparation of the soil for tree planting.

The method of blasting for and setting trees is about as follows, depending somewhat upon the character of the soil, depth of hardpan, etc.:

The holes are easily made by driving a pointed steel bar, 1½ inches in diameter and 4 feet long, to a depth from 2½ to 4 feet, as the depth of the hardpan calls for. The bar should not be driven entirely through the hardpan, but within from 6 to 12 inches. A one-half pound stick of 20 or 25 per cent, dynamite is primed with cap and fuse and carefully lowered and tamped. The first six inches of earth should be tamped very light-Iv and the balance should be tamped as tightly as can be done with a wooden tamping stick. The charge is now ready to explode, which is done by lighting the fuse. After the explosion, a barrel-shaped chamber is usually found 12 or 18 inches below the surface. This should be filled to a proper depth for the tree with rich humusbearing earth and the hole is ready. Set the tree and fill the balance of the hole with rich earth and it has every chance to live as far as its root bed is concerned.

# **QUERIES and ANSWERS**

We believe the greatest good can be accomplished for the greatest number, by instituting a query column; or an exchange of experiences, on practical propositions, by our readers.

You are invited to contribute questions, and answer others.
Each question as received will be given a number, the questioner's name will not be published, but the source of the answer will be given unless otherwise requested.

We all have something we would like to know more about. Here is your opportunity to ascertain somebody's experience in just that matter.

atter. Nothing will tend to better fellewship than helping each other. Take advantage of this "Question Box."

Can you give me any information through your "Queries and Answers" column about the cultivation of Gesnerias? Should they be started up in the spring or fall?-H. H. A., Ohio.

Gesneria should be started in the spring. Its culture is vary much like that of the Glexidia or Achinenes. If some eld plants, or tubercles, are at hand, having been placed somewhere in the hothouse or dry place, they should be started as soon as n w life is noted in them, about this time, or a little later in the year, When the new growth reaches about half an inch to an inch in height, even in the same pans or pots in which they were wintered, it is always advisible to plant them in smaller tere yers or shallows with very good drainage, using light sandy soil with some leaf mold. The tubercles should be planted somewhat higher, so that the new growth comes over the soil as they rot very easily. As the small pots are hard to keep well moistened and the watering must be very carefully done, the best way to put some white moss (sphagnum) around each new growth, which holds the moisture and damp atmosphere.

Temperature from 65° at start to 70° and over when the growth

progresses. Later fresh air will give the plants a more healthy appearance, but it must be *giren* very *carefully*, as the plant loves warmth and dampness. Good judgment is necessary in the shading, as the velvet green hairy foliage is very easily destroyed by too much sun.

When well-rooted shift from smaller to larger pots even after two or three plants are planted together. This should not be overlooked as well as feeding with some thin liquid cow manure which will help in developing better growth and better flowers.

Propagation can be done in different ways—from seeds about this time of the year—from tubercles dividing them—from single shells of tubercles—also from single foliage—in either case good results can be accomplished with proper care and attention. These beautiful plants should be more grown, especially the new hybrids as they are very fine and attractive,

Madison, Conn.

FRANK JOSIFKO.

The Gesneria, a most interesting family of plants, by regulating their rest period may be brought into bloom at almost any time. They may be propagated by cuttings of three kinds: First, the young shoots as soon as they are three inches long springing from the old tubers, as these are the best; second, leaves taken off with a bud at the base; third, by leaves without buds. There is an advantage in the first and second methods that the cutting if struck early in the year will, with moderate care, flower the same year. Whichever cutting is used put it in sand in the propagating bench under a bell glass or hand glasses with bottom heat to strike them quickly. A moist, warm heat is necessary. A moist cold place would rot the cuttings immediately.

Fibrous loam, turfy peat and half-decayed leaves in equal parts with a due portion of sand, well mixed but not sifted, is the best soil to use. Pot a portion of the bulbs in January and place them in heat, giving a little water. Temperature should be 60° to 80° with a second batch at the end of February to have

a succession of blooms,

In winter all they require is to be kept in these pots in a place where neither frost nor wet can reach them at a temperature not below 45° or above 55°. If the temperature is much lower they are apt to rot and if higher to start into growth.

Hingham, Mass. JAMES S. BACHE.

From the professional gardener's point of view, which are easiest to manage and give best results, own root, or grafted roses?-A. K. W., Massachusetts.

#### **New Everblooming WATER LILIES**

Water Lilies every day in the year. This is now possible with these new Hybrids. No better flowers for enting, shipping or lasting qualities. Awarded a Silver Medal by the Philadelphia Hortenlitural Society, Nov. 3, 1914. Certificated at New York, Lake Geneva, Wis, and Chicago. Everything in the line of new, rare and choice Nymphicas, of all species and varieties known in cultivation.

Send for my book "Making a Water Garden", 55; prepaid. My (alalogue will be mailed free on application.

Pennsylvania Horticultural Spring Show. Horticultural Hall Pinladelphia, March 23 25.

#### NEW LONDON HORTICULTURAL SOCIETY.

The first regular meeting in the new year of the New London Horticultural Society was held January 15. A good number turned out, this being the first meeting under the new officers. President Alfred Flower presided. It was decided to hold two shows this year rose show sometime in June, and a chrysanthemum and fruit exhibition in the fall. The society has had a very successful time in the year just gone, and interest in the same has greatly increased, which shows good for the year we have just entered upon. After the usual business routine President Flowers introduced Edward Smith, one of the city florists and a very successful carnation grower. to give a paper on the culture of carna tions. Discussion followed, and a very pleasant and instructive evening was spent.

The tables were arranged with vases of several varieties of carnations exhibited by the following: Edward Smith, Herbert Lickman, grower for Harkness Estate; Superintendent S. Jordan, Gustav Newman Mitchell Estate. Alfred Flowers exhibited some fine grown fresias. John Maloney, Primula Malacoides.

The next regular meeting will be held February II, and is to be in charge of lady members of the society. A local lady is to give a lecture on our native birds and their uses. Refreshments will be served to all the members, in charge of a committee under "Mrs. E. Smith." The Essay Committee would be glad to hear from any of our gardening friends who would like a trip to New London to give us a talk on any subject relating to horticulture. Dates are filled up to May. STANLEY JORDAN.

#### NORTH WESTCHESTER HORTICUL-TURAL AND AGRICULTURAL SOCIETY.

Thursday evening, January 21, was a red letter evening in the annals of above society in the social line, when they held their thirteenth annual dinner at the Newcastle Inn, Mt. Kisco, with that unapproachable toastmaster, Mr. J. Austen Shaw, to whose admirable tact, wit and humor, the society owes largely the success of this affair. Preceding the dinner was a short business meeting, at which a vote of condolence was passed for Mrs. McTaggart, of

Kearney, N. J., on the great loss she sus- THE SOUTHAMPTON HORTICULTURAL tained in the tragic death of her dear son and our brother member, the whole-souled, generous-hearted and much-regretted Chas. McTaggart.

Following are some of the features of the evening: Opening address by Mr. Shaw, who felicitated the society on its prosperous position and the work being done by it for the uplift of the gardening profession. Mr Shaw proposed the toast "Our Society, which was responded to by Mr. Hall, president, and Mr. James Andrews, past president, in a very appropriate address from each welcoming their friends and wishing all a good time.

Mr. Shaw proposed a toast to the revered memory of the friend of everyone in and outside the gardening world with whom he came in contact, our much-regretted friend and late associate, Charles McTaggart. The

to ast was drunk in silence.
"Seed Trade," spoken to by Mr. Wm. Rickards and Al Rickards, of New York, and Mr. W. J. Collins, of Boston, all in their humorous style of which they are past masters.

"Horticultural Press." Mr. Shaw took up this toast in the absence of Mr. Martin C. Ebel, of Madison, N. J., who was unable to attend owing to press of work and other engagements, and expressed Mr. Ebel's thanks for invitation, and then went on portraying the place the horticultural press holds in the gardening world today.

Town of Bedford. Responded to by Judge Robert Clark, Town Clerk Merriam and Commissioner O'Brien, all extolling the society for the efforts they are putting forth for a brighter and cleaner and more

artistic town in future.
"Town of Newcastle," to which a fine response was made by Supervisor Washburn, Town Clerk Haight and Tax Collector Heller on the growth and influence of the society.

"Our Out-of-Town Friends." Mr. Van Melee hardled this subject in a capital manner, thanking the society for their consideration towards the guests from out of

"Lav Members of Society," Dr. Plageman, V. S., spoke of the lay member in a scholarly manner as the Doctor generally does on such occasions. Well received and applanded.

Our Host and the Ladies." These two toasts were coupled, and Mr. D. M. Pardee, the genial host of the Kisco House, made the speech of the evening.
"The Plain Gardener." The secretary,

M. J. O'Brien, spoke to this toast by welcoming all present and wishing all a good time, going on some length on the position in which the gardener is placed in the community which leaves room for betterment, showing what can be done by local bodies with good executives in furthering the gardener and gardening to a higher plane. Also spoke on the origin of the society, how from a handful of earnest men the nucleus of the North Westchester Horticultural and Agricultural Society was formed in January. 1897, and has to day 94 good members. Among those present was Mr. Mex. Marshall, the original founder of the society, of whom Mr. O'Brien spoke so favorably that Mr. Shaw asked Mr. Marshall to say a few words, which he did with much applause. Alex, is a man of few words but a giant in gardening and gardeners' organizations.

The above programme was interspersed with songs and recitations during the addresses, and a fine musical discourse was rendered on the piano by Prof. Eggleston.

Letters of regret were read from Mr. Ebel, Mr. Totty and Mr. Sam Burnett, who through sickness, etc., could not be present, at the exhibition: M. J. O'BRIEN, Secretary.

# SOCIETY.

The annual banquet of the Southampton Horticultural Society was held in the Commercial Hotel, Southampton, on January 20, when there was a large attendance of members and their wives, who sat down to a some sixty persons present.

The president, Martin McLoughlin, presided at the tables, and he introduced the many speakers, including Wm. G. Ganersall, of Nyack, N. Y., who was listened to with great interest; Walter J. Jagger, of Southampton, who gave an interesting paper on "The Value of Education to the Farmer," and was heartily applauded, and W. D. Van Brunt, who gave a very pleasing address on Southampton.

The professional entertainer from New York, W. Hobson, kept the members in continual laughter with his amusing skits. The music was supplied by the local orchestra. which gave some fine renderings, and certainly helped to add great pleasure to a most interesting evening.

The very spirit of the banquet gave only one impression, that the Southampton Horticultural Society is united to carry on the good work of the past with greater vigor in the future.

At the regular meeting on January 21 it was decided to hold the annual show in July. The particulars will be published

Mr. C. E. Dinon and Mr. F. Burling were elected as active members of the society.

STANLEY R. CANDLER, Corresponding Secretary.

#### HORTICULTURAL SOCIETY OF NEW YORK JANUARY EXHIBITION.

The January exhibition of this society was held on Wednesday, January 20, at the American Museum of Natural History. The larger attendance of gardeners was gratitying, this perhaps being due to holding the exhibition on Wednesday instead of Saturday. There was a good display of flowers, especially of orchids. Two of the most attractive exhibits were made by Mrs. F. A. Constable (Jas. Stuart, gardener). One of these was a vase of cut blooms of Buddleia Asiatica, tastefully arranged, and making a striking display; the other, near it, a vase of Plumbago coccinea. flowers of the Buddleia made a striking contrast with the bright red blooms of the Plumbago. The displays of cut orchids by Lager & Hurrell and Clement Moore were exceptionally fine.

The next exhibition will be held at the same place on Wednesday, February 17. Prizes are offered for cut orchid blooms. roses, sweet peas, schizanthus, antirrhinum, freesias and narcissus. Prizes may also be awarded for other interesting and worthy exhibits not provided for in the schedule. Schedules will be sent on application to the secretary, George V. Nash, New York Botanical Garden, Bronx Park, New York

 $\dot{\Lambda}$  meeting of the society was held at 3:45, followed by a lecture at 4 by William N. Craig, on "A Year's Vegetable Supply from the Home Garden." This was listened to by the most successful lectures ever given here, interest was which was presented by the lecturer in a simple, practical way, which satisfied the

desires of those present, judging from the gathering surrounding Mr. Craig at the close of his talk. Following is a list of the prizes awarded

Vasc 100 blooms 1, Scott Bros.

Sakowich, for Hyde Park.

Vase of 12 white—1, G. D. Barron (James morning. Linane, gardener); 2, D. G. Reid (A. W. Golding, superintendent).

Vase of 12 Enchantress shade 1, Adolph Lewisohn (John Ganning, superintendent); 2, D. G. Reid.

Vase of 12 Windsor shade—2. John. I. Downey (Thomas. Ryan, superintendent): first not awarded.

Vase of 12 Mrs. C. W. Ward shade-1.

D. G. Reid.

Vase of 12 dark pink—1, Adolph Lewisohn; 2, G. D. Barron.

Vase of 12 scarlet—1, Adolph Lewisohn; 2. D. G. Reid.

Vase of 12 crimson—1, D. G. Reid.

Vase of 12 blooms, variegated-1, Adolph Lewisohn.

Vase of 50 blooms, arranged for effect, one or more varieties-1, D. G. Reid; 2, Frederick Sturges (Thos. Bell, gardener).

Vase of 100 Sweet Peas-1, Mrs. F. A. Constable.

medal.

Vase of Schizanthus—1, Adolph Lewisohn. Collection of cut Orchid blooms-1, Lager & Hurrell; 2, Clement Moore.

Collection of cut Orchid blooms -1, Mrs. F. A. Constable.

Special prizes: G. D. Barron, vase of Mignonette, cash; H. Fred Byxbee, four vases of Daphne odorata, certificate; Fred erick Sturges, vases of miscellaneous flowers, cash; T. D. Leonard (E. Leandle, gardener), vase of Freesias, cash; Mrs. F. A Constable, vase of Buddleia Asiatica, certificate and cash; vase of Plumbago coccinea, cash; Mrs. H. Darlington (P. W. Popp, gardener), for new Carnation Mrs. Darlington, honorable mention; G. E. Baldwin & Co., for plant of Cattleya Trianæ, silver medal; Clement Moore (J. P. Mossman, gardener), collection of orchid plants, silver medal and cash; R. & J. Farquhar & Co., Boston, plants of Azalea Kampferi, silver

GEORGE V. NASH, Secretary.

## ANNUAL FALL EXHIBITION.

The Annual Fall Exhibition of the Horticultural Society of New York will be held on November 4 to 7, inclusive, at the American Museum of Natural History. schedule of premiums is now being prepared, and as soon as ready announcement will be made in these columns.

This is the big autumn show around New York, and it is hoped that other societies in this vicinity in fixing the dates of their shows will avoid this period in so far as possible. Such action will accrue to the hest interests of all.

GEORGE V. NASH, Secretary.

#### MANCHESTER, MASS.

The annual banquet of the North Shore Horticultural Society was held at the Town Hall January 27. There was an attendance of 200. Members of the Banquet Committee, Wm. Till, P. J. Gilmore, Paul Maillard, Axel Magnuson, James Morton and M. Mackay, decorated the hall and tables beautifully, and the menu left nothing to be desired. E. H. Wetterlow presided at the postprandial exercises and extended a cordial greeting to all present. Thomas J. Grey responded for the Gardeners' and Florists' Club of Boston and the Massachusetts Horticultural Society in his usual humorous strain. Piano selections were furnished

New Carnation, bronze medal to Joseph | ning and made an eloquent address, after | which dancing was enjoyed until early

#### MENLO PARK, CALIF.

The annual election of officers of the Menlo Park Horticultural Society was held Thursday evening, January 21, and the following officers were elected to serve during the ensuing year: Henry Goertzhain, president; David W. Slade, vice-president; Percy Ellings, secretary; Arthur Bearsby, financial secretary; George Nunn, treasurer. Thomas Templeton was elected trustee, succeeding James T. Lynch, whose term expired. An exhibition committee to serve for one year was appointed as follows: John M. Daly, Percy Ellings, David Bassett, George Nunn and David W. Slade. Percy Coff and John Aitken were selected for ushers. Several new members were admitted and a few applications for membership were received. The society decided to hold a smoker at the next regular meeting, and President Goertzhain appointed a committee to make the necessary arrangements. The exhibits made were varied and excellent. As John M. Daly and Chas. Ehrich tied for the most points for the best display during the past year it was decided to award a gold medal to each.—American Florist.

#### NEWPORT, R. I.

Under the joint auspices of the Newport Horticultural Society and the Garden Society, H. L. Frost, of Boston, Mass., gave a lecture January 26, on injurious insects. The stereopticon showed the pests in their various stages of growth and localities they have ravaged. Among the varieties treated upon by the lecturer were the gypsy moth. tent caterpillar, brown tail moth and boxwood minor. In regard to the latter, he said it was found mostly in Newport, and the large audience present gave the lecturer rapt attention throughout his discourse. At the close, warm applause showed the appreciation of his hearers. At the next meeting of the Newport Horticultural Society the matter of swelling the building fund will be discussed, and from all accounts the discussion is liable to bear fruit, as many members seem to think that the time is ripe to build. The society has completed arrangements for the coming to Newport of the American Sweet Pea Society. This show will take place at the Casino July 8-9. Alexander McLellan has been appointed exhibition manager, and the schedules are now being distributed .- Exchange

## NEW JERSEY FLORICULTURAL SOCIETY.

The regular monthly meeting of the New Jersey Floricultural Society was held on Monday evening, February 1. There was a good attendance, considering the stormy The exhibits were of fine quality weather. and added to the pleasure of the evening.

The awards were as follows: Vase of Sweet Peas, Mrs. A. J. Moulton (gardener, Arthur Jackson), 63 points; Primula malacoides, same, 65 points; Epiphyllum truncatum, Mrs. Wm. Barr (gardener, Emil Panuska). 75 points; vase of Carnations, Peter Hauck, Jr. (gardener, Max Schneider), 80 points; Begonia Cincinnati, same, 70 points; vase of Roman Hyacinths, same, 55 points; by E. A. Rand, readings by Miss Area Farron, while Prof. Brignate, sleight of hand humorist, entertained for half an hour with mystifying tricks. The Rev. W. H. Rider, D. D., was the principal speaker of the evelone in the same, 55 points; bunch of Violets, same, 65 points; Cattleya Trianæ Virginale, Jos. A. Manda, not for competition, 90 points; Cattleya Trianæ, Joseph A. Manda, cultural certificate; Primula malacoides, Freesia Purity, plate of

# Shorburn's Seeds

There is no pleasure like watching things grow.

EPENDABLE seeds mean more to those who "grow for profit" than to other folks.

Our 1915 Spring Catalogue has not only the real "breath of the spring in it," and "the love of growing things," but a wealth of information prized by the practical man.

> If you have not received your copy it is waiting for you. Kindly send for it, and let us know your requirements, and how we may be of service to you.

J. M. Thorburn & Co. 53U Barclay St., through to 54 Park Place **NEW YORK** 

Just to look through its pages will make you long for spring to come

mushrooms, Mrs. A. J. Moulton, cultural certificate. Judges: Edgar Bourne, Fritz Berglund, Geo. W. Strange. GEO. W. STRANGE, Secretary.

## LENOX (MASS.) HORTICULTURAL SOCIETY.

The twenty-first annual ball of the above society was held in the Town Hall on January 22. The hall was prettily decorated, and Clarke's orchestra of Pittsfield was engaged for the evening. The concert which they rendered at the opening was of a high order. President G. Breed led the grand march, followed by the other officers. A good and representative crowd was present, and supper was served at 12 o'clock. The success of the evening reflected much credit on the following who acted as committee of arrangements: J. Clifford, G. Ferguson, H. Peters, G. Thompson and F. H. Butler. J. CARMAN,

#### OYSTER BAY HORTICULTURAL SOCIETY.

Assistant Secretary.

The monthly meeting of the Oyster Bay (N. Y.) Horticultural Society, was held in Fire Hall, on Wednesday, January 27. A large attendance welcomed our new president, Mr. Robinson. Charles Mills showed a fine plant of cineraria and F. Kyle some very well grown sweet peas, each capturing the societys' monthly prize. Considerable discussion was given Mr. Duthie's suggestion that a member in good standing moving into a new territory be accepted in the nearest local society without the usual formalities. Geo. C. Woolson gave a very interesting talk on hardy perennials, calling special attention to some of our native plants and trees.

Four new members were elected and reports read show the society to be in flour-

ishing condition.
ANDREW R. KENNEDY, Secretary.

# TARRYTOWN. N. Y.

The monthly meeting of the Tarrytown Horticultural Society was held Wednesday evening, January 20. As the monthly prize was to be awarded for the best flowering plant, a good many well grown plants were exhibited. A. Weeks captured first prize with a fine specimen of Chorizema cordatum splendens. Some good primulas and cyclamens were shown by J. Elliott, T. Morris, M. Jamison and G. McIntosh. H. Nicholls was awarded a certificate of merit for seedling Dracæna Glenview, a cross between amabilis and terminalis. A lively discussion followed the examination of ex-Mibits, taken part in by J. Bradley, J. Mooney, T. Morris, Wm. Scott and others members of the society.

T. A. L.

## TUXEDO HORTICULTURAL SOCIETY.

A team of assistants challenged a team of head gardeners of the Tuxedo Horticultural Society to a bowling match, the best of three games, which was played off on January 27 in the Firemen's Club, Tuxedo Park. The teams were well matched, and ran neck and neck through the first game, which resulted in a draw. To decide the game each player bowled an extra frame. and the head gardeners beat them by 20 pins. The second game there was better bowling. Some fine scores were put up, the game running very close till after the fifth frame, when the gardeners began to stretch away from them and finished 52 pins to the good. The teams were:

Head Gardeners-E. Barth, J. Tansey, D. | guests were present, and all united in say-S. Millar, S. Hilmers, C. Sheppard, P. Cassidy, T. Wilson.

Assistant Gardeners Jas. Davidson, Wm. Muir, H. Watson, T. Eastham, Wm. Grantham, Alex. Roy, J. Kelly.

After the game the assistants again challenged the gardeners, which is to be played in the near future.

THOS. WILSON, Secretary.

#### NASSAU COUNTY HORTICULTURAL SOCIETY.

The ninth annual dinner of the Nassau Horticultural Society was held in the Ori ental Hotel, Glen Cove, Monday evening. January 25. Seventy-five members and

ing the dinner was the best ever. President Ernest Westlake delivered a short address of welcome, and then introduced J. Austin Shaw as toastmaster for the evening. Gentlemen responding to the toasts of the evening were Charles H. Totty, for the Society of American Florists; John W. Everett, National Association of Gardeners; R. I. Bowne and W. R. Kinnear, the village of Glen Cove; William Turner, Bernardsville (N. J.) Horticultural Society; William Duckham, Morris County (N. J.) Horticultural Society; E. W. Newbrand, W. Scott and J. N. Smith, Tarrytown Horticultural Society; J. Duthie and J. Robinson, Oyster Bay Horticultural Society.

JAMES GLADSTONE, Corresponding Secretary.

A well-kept lawn is "a thing of beauty and a joy forever." Good taste, joy of ownership, love of beauty and civic pride are all expressed by a handsome lawn, just as a scraggily, ill-kept lawn denotes an owner of careless habits.

#### BOSTON MIDWINTER FLOWER SHOW.

The main exhibition halls of the Massachusetts Hortueultural Society were filled on February 6 and 7 on the occasion of the Boston Midwinter Flower Show. Pot plants were of splendid quality and competition was quite keen. Awards in some of these classes were as follows:

Six pots Freesias: 1st, George Page, gardener to Mrs. Frederick Ayer; 2d, H. Stewart, gardener to Miss Cornelia Warren; 3d, E. H. Wetterlow, gardener to Mrs. Lester Leland.

Six Begonia Gloire de Lorraine: 1st, William Thatcher, gardener to Mrs. J. L. Gardner; 2d, W. W. Edgar Co.; 3d, Alex, McKav gardener to E. A. Clark.

Eight Prumula Simensis: 1st and 2d, M. Sullivan, gardener to William Whitman; 3d, William Thatcher.

Eight Prumula Stellata: 1st, William Thatcher; 2d, Martin Sullivan.

Eight Prumula Obcomea: 1st and 2d, Martin Sullivan; 3d, William Thatcher.

Eight Prumula Malacoides: 1st, Martin Sullivan; 2d, A. J. Newell, gardener to Ε. S. Draper; 3d, William Thatcher.

Light Roman Hyacinths: 1st, William Thatcher; 2d, Martin Sullivan; 3d, Duncau Finlayson, gardener to Larz Anderson.

Six Polyanthus Narcissus: 1st, William Thatcher.

Six Calanthes: 1st, William Thatcher. Three Orchids other than Calanthes: 1st, Duncan Finlayson; 2d, J. T. Butterworth; 3d, William Thatcher.

Specimen Orchid: 1st, D. Finlayson; 2d, J. T. Butterworth; 3d, William Thatcher.

There was a magnificent display of carnations in the private gardeners' class. George Page took first and second and Alex. Mc-Kay third.

George Page had a beautiful group of Ericas and a grand specimen of Acacia. Walter Angus, gardener to A. Lyman, had a collection of Camellias: Martin Sullivan and H. Stewart had fine groups of hard wooded and other plants. William Martin. gardener to N. T. Kidder, had fine seedling Amaryllis; one carried fourteen flowers on three spikes to the bulb.

# MORRIS COUNTY GARDENERS' AND FLORISTS' CLUB.

The annual dinner of the Morris County Gardeners' and Florists' Society was held at Piper's Hotel, Morristown, N. J., on Tuesday evening, January 19. The dining hall and tables were beautifully decorated with plants and flowers. Many out-of-town friends of the society were on hand. A fine musical programme was presented, and from the time the members and their friends sat down at the tables until nearly midnight, when "Auld Lang Syne" was sung, good fellowship prevailed.

Robert Craig, of Philadelphia, was introduced as toastmaster by President Percy Witney, and he performed his duties to perfection. Telegrams were received from John W. Everitt, Glen Cove, N. Y., president of the National Association of Gardeners, and from George C. Watson, Philadelphia, expressing their regrets at not being present. The following toasts were responded to: "The Morris County Gardeners' and Florists' Society," Wm. Duckham; "The Society of American Florists," Charles H. Totty; "The American Sweet Pea Society," Harry A. Bunyard; "The New York Spring Flower Show," Richard G. Holloman; "Our Good Fellows," J. Austin Shaw; "The Horticultural Press," J. Harrison Dick; "The National Association of Gardeners," M. C. Ebel; "Ornamental Horticulture," Arthur Herrington; "The Ladies," Joseph A. Manda.

Burpee's Seeds Grow

THE truth of this famous slogan is proved by thousands of pleased and permanent customers. The Eurpee Idea of Quality First—"to give rather than to get all that is possible"—combined with efficient service, has built the world's greatest mail order seed business. We deliver seeds free by parcel post, and have not advanced prices because of the war. Write today for Burpee's Annual, the "Leading American Seed Catalog" for 1915. It is mailed free.

# W. ATLEE BURPEE & CO.,

Burpee Buildings

Philadelphia.

# SOUTHAMPTON HORTICULTURAL SOCIETY.

The above society held its regular meeting in the Odd Fellows Hall, Southampton, on February 4, when there was a good attendance of members, and with President McLoughlin in the chair.

The visitor of the evening was Mr. Andrew Kennedy, who addressed the members at some length on interesting topics, one of the chief items of which was a discussion of the proposed scheme of the mutual co-operating between horticultural societies. The members decided in its favor, and promised their support.

M. J. Guilfoyle, the local florist, was awarded an award of merit for two extra fine vases of carnations. An essay was read by S. R. Candler on "Schizanthus and Their Culture"; then there was a good discussion.

It was decided to hold the annual flower show in Southampton on July 28 and 29, 1915; list of prizes to be issued later.

Two new members were elected as active members of the society -Mr. H. Elsworth and Mr. Charles Fulton.

The next meeting of the society will be held on February 18.

S. R. CANDLER, Corresponding Secretary.

#### PITTSBURGH FLORISTS' AND GARDEN-ERS' CLUB.

The club meeting of February 2 was held at the Fort Pitt Hotel with a large attendance of members.

The election of officers for the year 1915 resulted in the retention without change of the officers for 1914, viz.:

President, Neil McCallum; vice-president, E. C. Reineman; treasurer, T. P. Langhans; secretary, H. P. Joslin; assistant secretary, W. A. Clarke: Executive Committee: P. S. Randolph; C. H. Sample, A. Frishkorn. There was a remarkably fine exhibit of roses from the E. G. Hill Company of Richmond, Ind., and of blooming begonias in pots from A. J. Peterson & Sons, Cincinnati, together with a number of exhibits from home growers.

ANNUAL

1915

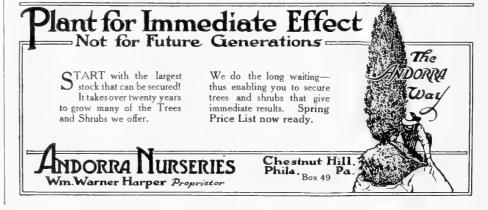

Mr. Emil Kraft, of Pittsburgh, gave a talk on radium, and especially the influence of radio-active earth in plant growth and crop production. First describing the discovery of radium, he showed by lantern slides the ore-fields in Colorado and the reduction of the ore and the extraction of radium, 400 tons of radium ore being required to produce on an average 151/2 grains of radium. After the radium is extracted the residue is left in a finely powdered condition, and it is the application of this to the soil and the results therefrom that florists are principally interested. The powdered radium ore was applied to the land in the proportions of 25, 50, 100 and 200 pounds per acre. The result of the experiments showed that an excess of radium would decrease the crop. For example, on turnips the 50-pound plat showed better results than those with either larger or smaller amounts of the powdered The effect on lawn grass was specially marked in increased yield. On the other hand, some experiments in the South have shown very little results.

It is evident that the experimentation with radio-active earth is only in its infancy, but enough has been demonstrated to attract universal interest, and to cause the liveliest attention from all interested in horticulture.

H. P. JOSLIN, Secretary.

#### TUXEDO HORTICULTURAL SOCIETY.

The usual monthly meeting of the Tuxedo Horticultural Society was held on February 3. President Frederick Rake in the chair. There was a good attendance of members present. The society has arranged

# entropalarmonamenta de la calenda de la composição de la JOSEPH MANDA

Orchid Specialist

West Orange - New Jersey

Something to all community of the control of the co

to have its annual ladies' evening in April and its ball in May. Two new members were elected to membership, Neil MacMillan and A. Bissett.

The lecture for the evening was given by Mr. David McIntosh on "Ferns," which was very interesting, and was freely discussed among the members present. We have arranged to have a lecture at each monthly meeting during the year. The series of lectures given at our meetings last year were well attended and brought out some fine discussion.

The president appointed Messrs, J. Davidson and Tansey to look over an exhibit of a specimen plant of Chorozoma Cordatum Splendins by Thomas Wilson, which they awarded a certificate of culture.

The society will hold its Rose and Carnation night on March 3, when we expect quite a few exhibits from the commercial growers of some of their novelties, also classes for 6 and 12 carnations and the same number of roses and any other pot plants and cut flowers. A letter was read from Mr. C. H. Totty offering the Wells' gold, silver and bronze medals for competition at our fall show for the new mum, Mrs. G. G. Mason, which has been named after one of the residents of Tuxedo Park

THOS. WILSON, Secretary.

#### THE WESTCHESTER AND FAIRFIELD HORTICULTURAL SOCIETY.

A large percentage of the entire member ship was represented at the regular monthly meeting of this society, held in Greenwich, Conn., Friday evening, February 12. The membership list was increased by the admission of some new members, and several names were proposed and placed on file

It was voted to hold the annual fall ex hibition, dates and location to be announced later. Mr. John Canning offers 820 m gold as a sweepstakes prize for the best specimen bush plant in the chrysanthemum class. The A. N. Pierson Company of Cromwell Conn., offers eash prizes for two classes of large flowered mums, and in two classes of pompon mums 1915 novelties.

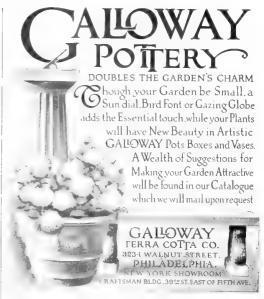

number of visitors were present, including Messrs, Arthur Herrington, Charles H. Totty, W. J. Collins, A. L. Ricards, M. C. Ebel and Henry Kelly.

Mr. Herrington, who has been appointed manager of the National Show to be held in Yew York in March, spoke at length regarding the plans and preparations being made to make the exhibition of 1915 a success that will eclipse all former efforts in this direction. These exhibitions afford the gardener plenty of opportunity to display the results of his skill and also gain the respect and confidence of his employer, whose co-operation is essential and necessary. The other visitors each in turn spoke briefly. complimenting the members on the wonderful progress made by the society in such a few years, and on the unusual attendance and quality of our membership as attested by the very fine monthly exhibits that are in evidence at every meeting.

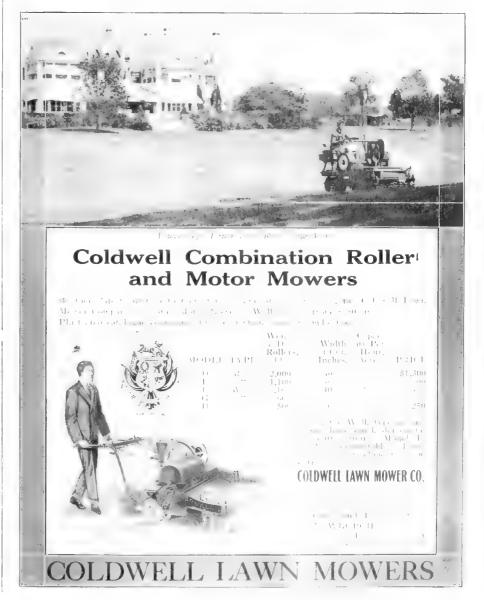

The lecturer for the evening, Mr. Henry Kelly, held the attention of all present with an excellent paper describing at length the varieties of conifers that are suitable and thrive in Fairfield County, Conn., and Westthrive in Farmeid County, Conn., and West-chester County, N. Y. The lecturer also de-scribed minutely the diseases and insect posts that attack overgreens. A rising rote

for thanks was accorded to Mr. Kelly for his i instructive and interesting paper.

Mr. Thomas Ryan, of Portchester, N. Y. read a paper dealing with the culture of sweet peas, from the propagating hed to the exhibition table, which was rendered in a very comprehensive manner, and was replete with useful and helpful suggestions. A very with useful and helpful suggestions. A very sturdy young plant was exhibited by Mr. Ryan, illustrating his method of training and disbudding. A rising vote of thanks was tendered to Mr. Ryan for his valuable essay. A wonderfully fine display was on the exhibition tables, a feature of which was the competition for the John Canning prizes for the best vase of roses. James Stuart gained the first prize with a good vase of Killarney Brilliant. The second prize went to Robert Grunnert for a vase of the same variety. The judges made the following awards in the non-competitive section: Cultural certificate to Robert Allen for a grand vase of mignonette, Farquhar's "Universal." A beautiful vase of carnations from W. H. Fisher received honorable mention, as did a fine vase of carnations from Robert Grunnert. A. Wynne was highly commended for display of well-grown plants of Primula Malacoides, and M. Alba also a vote of thanks for an excellent vase of stocks "Beauty of Nice." James Linane was very highly commended for a fine display of wellgrown cyclamen plants. Carl Hankenson thanks. A basket of minature pink hya-received a vote of thank for a good breigh einths "Nimrod" and hip of the valley ar

of violets. A display of cinerarias from Robert Allen was accorded honorable mention. Vase of orchid flowering sweet peas from Patrick Fairfield received a vote of

# Radium Makes Things Grow

Its effect upon vegetation is very marked, producing more rapid growth and luxuriant appearance, as well as improving quality and production. Radium Brand Fertilizer (R.A.F.) is a scientific and thoroughly tested combination of Radium Element with fertilizer. Try a can and see what gratifying results follow its use. One pound will fertilize 50 sq. ft. of surface.

Before being offered to the public, it has been successfully tested on 130 acre farm under direction of famous Botanists and Horticulturists; also by Phipps' Conservatories, Pittsburgh, Pa., and manyothers in various parts of the country. These results told in our interesting free booklet, "Radium Makes Things Grow," illustrated with photographs of plant life grown with and without Radium Brand Fertilizer (R.A.F.). Write today for this booklet, and also order a sample can by mail.

#### Sample Can, Prepaid, 25c

# CONNECTICUT HORTICULTURAL SOCIETY.

This society held a record-breaking meeting on Friday evening, February 12, in the County building Hartford, President Mason presiding. The secretary read a letter from Mr. Harry Jones, secretary of the Nassau County Horticultural Society, with regard to a member who changes his place of residence having the privilege of full membership in some other society without being formally elected as a new member; that is, simply transferring him from one society to another with full privileges. This matter was left to the secretary for attention. President Mason announced that one of the large seed houses would donate a silver cup as a special premium at the fall dahlia show.

According to the schedule, this was cy clamen and primrose night, and Mr. Frank Roulier exhibited eight pots of cyclamen and six pots of primula malacoides, and Mr. Carl Peterson exhibited a lemon as large as grape ruit. O. F. Gritzmacher, Nathaniel Slocombe, and George B. Baker were ap pointed judges by President Mason, and they awarded the cyclamen and primula malacoides a first-class certificate, and the lemon a cultural certificate. Mr. Huss, the former president, gave a most interesting and edifying talk on how to protect the cyclamen from the mite, and also as to the time of sowing the seed and transplanting, and cultivation to maturity. President Mason suggested that the members make better use of the question box, as that was the only way amateurs could acquire knowledge covering the science of horticulture. Five new members were added to the society roster. There were thirty members present, and a lively discussion took place relative to a flower show to be held some time in May or early June.

ALFRED DIXON, Secretary. Wethersfield, Conn., February 15, 1915.

# EXHIBITION OF THE AMERICAN ROSE SOCIETY.

The exhibition of the American Rose Society for March 18 to 21, inclusive, is being taken well in hand by the Boston horticultural interests, with the determination to provide an exhibition of the first class.

The American Rose Society has already received twenty (20) special prizes besides the

regulars. A special prize, a little different from anything that has been offered beore, is made by the Glenfrew farm, Sewickley, Pa., for the best dozen roses grown by an amateur. There may be two varieties. Amateur gardeners nor commercial rose growers may not compete, it being solely for amateurs a silver cup, valued at \$20. This prize is given to encourage lovers of roses as the English Rose Society has been doing for years past.

Free tickets to the show will be issued to all members.

BENJAMIN HAMMOND. Beacon, N. Y., February 16, 1915.

# NASSAU COUNTY HORTICULTURAL SOCIETY

The regular monthly meeting of the Nassau County Horticultural Society was held in Pembroke Hall, Glen Cove, Wednesday, February 10. President Ernest Westlake in the chair.

W. H. Reynolds was elected to active membership, and one petition for active membership was received.

The judges for the monthly exhibits were Messrs, J. F. Johnstone, W. Robertson and G. Gilder, and their awards as follows:

Competition 12 sprays of Freesia: 1st, James McDonald.

One pot of stock; 1st, James McDonald. One pot of Primula Malacoides: 1st, Frank Honeyman.

For exhibition plant of Primula Malacoides improved shown by James Duthie very highly commended.

Pot of Freesia shown by Harry Jones, thanks of the society.

President Westlake announced he would offer a fountain pen at our next meeting for the best vase of 25 carnations mixed. Other exhibits will be 12 white carnations, 12 pink carnations and 12 any other color.

JAMES GLADSTONE,

Corresponding Secretary.

# For Everything You Grow **Use Alphano Humus**

\*

FOR LAWNS, SHRUBS, FLOWERS, VEGETABLES

It's Nature's Soil Builder

ITHOUT humus, no soil can be fertile." Such is the statement of Government soil experts. Alphano Humus is a concentrated humus and plant food combined. It will give an immediate and long enduring fertility to any and all soils, no matter if sterile sea sand or unproductive blue clay. It will bind the one together and loosen the other up.

It will induce thick, vigorous lawns that withstand dry weather, when others are burned and yellow. It will stimulate immediate root action in shrubs and trees, resulting in a sturdy, free top growth.

Being odorless, highly sanitary and in

powdered form; making it agreeable to mix with the soil, it gives to flower gardening an added pleasure and makes possible the height of plant and bloom development.

Being rich in plant foods, both those immediately available and the more slowly liberated ones, it immediately stimulates vegetable growth and keeps them growing vigorously the seasons through. In short, it is nature's balanced

Send for the Humus Book for full facts and directions for use. Let us know the area of ground you wish to enrich and we will gladly advise how much Alphano Humus you need.

# WHERE WE STAND

New York

Iplane Manufacturing Company. Madison, N. J.

Gentlemen

I am returning the enclosed bill as you have not or 25%, which the other manufacturers of agricul-tural chemicals allow me. As I am acting as a purchasing agent for a great many places in this actinity and as a large number of orders pass through my office every year, it is only just that I should be allowed the usual agency commission. Will you kindly let me hear from you in this matter? Yours truly,

Pear Sir.

Your favor of the 28th ult. at hand, in which you ask us to allow you a discount on the enclosed bill. It c have only two prices—one a wholesale or dealers price, and the other a retail price. The wholesale prices are quoted and allowed only to dealers who actually handle our products and carry them in stock

It has always been our policy not to allow any discount to landscape gardeners or to purchasing agents of private estates, as we understand it is the custom of the estate owners to pay these buyers for

the services they render.

We are very much opposed to the practice of some of these buying agents who return the discounts, when they are allowed them, to their clients. This has created a false impression and one that we believe has been decidedly detrimental to the interest of horticulture and no doubt in some instances has served to discredit the loyalty of some of our best gardeners to their employers. A gardener would not be able to obtain these discounts from us and we containly exold not be instifud in growing them to certainly would not be justified in granting them to any other representative of the estate owners.

Yours truly,

Aphine Vanufacturing Company.

M. C. Ebel, Treasurer.

FUNGINE For mildew, rust and other blights. It is perfectly safe to apply to fruits and vegetables, as it is non-poisonous.

VERMINE For eel, cut and wire worms working in the soil. It can be applied to all vegetation.

NIKOTIANA A 12' Nicotine solution properly diluted for vaporizing, fumigating and spraying.

SCALINE For San Jose, Oyster Shell and all scale on trees and hardy stock.

If you cannot obtain our products from your local dealer, send us your order with remittance, and we will ship immediately through our nearest agent.

OF ANDERED

# Burnett Bros.' Grass Seed Mixtures

We make a specialty of Grass Seed Mixtures and supply many of the largest estates in the country.

Write for our Illustrated Booklet HOW TO MAKE-HOW TO KEEP A PERFECT LAWN.

⊡

Burnett's Special Lawn Grass Mixture

The above maxime is made from our own formula, and composed of grasses specially adapted for the purpose of producing turf which retains its rich green color and velvety appearance throughout the entire Summer and Fall. In making up this high grade mixture we are careful to use only the very finest quality of all the most desirable dwarf evergreen, recleaned grasses, free from chaff and weeds, which thrive well on any soil, thus ensuring a beautiful and permanent lawn.

To obtain good results Lawn Grass Seed should be sown as soon as the ground can be prepared in early Spring. It may also be sown in the Fall with good results. One quart will sow 15 x 20 feet (300 square feet); I bushel, 100 x 108 feet (10.800 square feet), 4 to 5 bushels to the acre.

Price: Qt. 25c., pk. \$1.75, bushel (20 lbs.) \$6.00.

# Burnett's "Central Park" Lawn Grass Qt. 20c., pk. \$1.50 bush. (20 lbs.) \$5.00

Burnett's "Shady Place" Qt. 30c., Pk. \$2.00 Lawn Grass

Burnett's "Bank and Terrace" Qt. 30c. Pk. \$1.75 Lawn Grass

Bush. (20 lbs.) \$6.50

Grasses for Golf Courses, Etc.

We have made a specialty of Fine Grass Seed Mixtures for many years, suitable for Putting Greens and Fair Greens, and are direct importers of the various European grasses and handle largely the domestic varieties necessary for the formation of correct formulas to cope successfully with the many different conditions of soil, location and climate.

Many clubs have experimented with their greens until they have been successful in the combination of a mixture that gives perfect satisfaction in their particular location. In such instances we will be glad to offer the necessary grasses separate or make a mixture to the required formula.

This Collection, exhibited at the Horticultural Show, Cardin, Wales, 1914, took the Gold Medal.

# Grown from the "Seeds with a Pedigree"

In the exhibition of a prize-winning collection of vegetables or flowers, credit is shared alike by the gardener and the seeds he uses. In Great Britain, it is a notable thing that a large proportion of all Horticultural Show Prizes are taken by products grown from Carter's Seeds. This is due not only to the virtue of the seeds, but to the fact that most skilful and experienced gardeners use them. These gardeners know that Carter's Seeds are dependable. They know that long pedigree and careful testing remove all uncer-

tainty so far as possible and insure healthy, well-selected seeds.

Since their introduction in America, Carter's Seeds have made an equally notable record. In many private and public gardens they have achieved displays never before seen in this country.

If you have not received your copy of the 1915 Carter Catalog, American Edition, by all means write for it at once. Mailed free on request.

# Quality and Reputation

A LL of the seeds, plants and bulbs that you purchase are bought on the reputation of the seller. Even the most thoroughly trained seedsman or horticulturist is unable to give a satisfactory opinion without exhaustive tests, and with this fact in mind it is always desirable to first investigate the reputation of your seedsman. The business of Peter Henderson & Co. was established in 1847 and has been built to its present proportions by the most careful attention to quality.

The third generation of Hendersons are in charge today and there is something more than just a plain business relationship existing between themselves, their employees and their customers. When you buy Henderson's seeds you buy 69 years of experience; you buy the prestige and reputation of years of successful seed raising and selling; you buy seeds that have behind them the sentiment brought out by many years of careful, conscientious attention to our customers and their wants. The very smallest part of the cost is represented by the

seeds and it is by far the most important. Try the Henderson Way this year and see if there isn't a difference.

We should be glad to send our 204-page catalogue without charge to anyone mentioning "The Gardeners' Chronicle."

# Plant Our Summer Orchids Plentifully

UR Summer Orchids are the productions of Autoine Wintzer, the famed hybridizing Wizard of the East.

Following the work of several French and Italian enthusiasts, he developed the little red blooms of the Indian Shot, or South American Canna, into a marvelous collection of large Orchid and Lily shaped blooms, that compete in colors with the rainbow.

All the Summer long they bloom. For color spots among border plantings or general garden schemes, they are most effective.

Massed around the foundation or in groups on your grounds, they give rich, abundant foliage effects, mingled with their charming bloom colorings.

For 15 years Mr. Wintzer labored, developing his pet white Summer Orchid, called "Blanche Wintzer." Think of the patience. Put that's the kind he is."

In addition to the wonderful size and color development of the flowers, Mr. Wintzer has also induced a dozen or more of them to put on garbs of bronze foliage instead of green, adding still further color and group combinations.

Some he has persuaded to grow but 18 inches high. Others 3 reet. While several hold up their regal bloom heads a full 7 feet.

With such a range of sizes, the effects possible are almost limitless. Below is a collection of 10 each, in all three sizes. Mr. Wintzer selected them from the list of his 87 varieties. He says they are the very cream of all his favorites. Make your selections and send your order early, because like favorites in general, these are much in demand and the supply is somewhat restricted.

# A Few Specialties

which we believe we have in larger supply and of better quality than can generally be obtained. All of our EVERGREENS are transplanted frequently, root pruned, trimmed frequently, and will lift with fine balls of earth. Our stock of large specimen

# RHODODENDRONS

is unequaled. We grow only the very hardiest varieties—those that have been tested and that are thoroughly dependable. We believe we have the largest stock of large specimen rhododendrons to be found anywhere in this country. Our plants have been grown on our own grounds for a dozen years or more, and are thoroughly acclimatized, so that they are preferable to any imported plants. While we can supply smaller sized plants, we are particularly strong on plants ranging in height from three to six feet.

We call particular attention, also, to the following

# **EVERGREENS**

Very large **HEMLOCKS** from six to twelve feet in height,—exceptionally fine compact sheared specimens.

JUNIPERUS VIRGINIANA GLAUCA, fine pyramidal specimens four to eight feet in height. JUNIPERUS PFITZERIANA, large stock of fine specimens from two to six feet in height.

THUYA STANDISHI, or SITKA ARBOR VITAE, the hardiest of all arbor vitae. Fine specimens five to nine feet in height.

**COLORADO BLUE SPRUCE.** Our stock of this in large specimen trees is unequaled. We can supply trees in any size from three to twelve feet in height,—absolutely perfect specimens, all of the true Koster type. Very low prices for carload lots.

**TAXUS CUSPIDATA.** We have an unequaled stock of this rare and valuable evergreen, which we can supply from three to four feet in height,—broad, fine, perfect specimens.

# **DOGWOODS**

We have an unusually fine stock of very large specimens of **White-flowered Dogwoods**,—one of the most beautiful of our American trees,—plants ranging in height from six to twelve feet; also a fine lot of **Red-flowered Dogwoods** five to six feet in height. These large red-flowered dogwoods are very scarce.

# JAPANESE MAPLES

An unusually fine lot of specimen plants of ATROPURPUREA SANGUINEA and DISSECTUM, well-grown specimens from four to six feet in height.

# **HYDRANGEAS**

Grown in large tubs and half-barrels for summer-blooming. Otaksa and the new French varieties.

# **ROSES**

of which we make a specialty. We will be glad to quote prices on all the new and standard varieties,—Prince E. C. d'Arenberg, Francis Scott Key, Ophelia, Killarney Queen, Killarney Brilliant, White Killarney, etc., etc.

# NEARLY FORTY YEARS OF SUCCESSFUL SEED SELLING

E are now in our thirty-ninth year of supplying "Seeds That Grow" to critical private and market gardeners' trade. For more than thirty years we have been selecting and re-selecting all of the leading vegetable and flower seeds. We feel sure that better seed cannot be produced.

Since first starting in business (1876) we have specialized in supplying seeds direct to planters who appreciate Quality. We have never sought a retail counter trade, as we feel that with easily understood catalogs, better service could be rendered by requesting the planter to make up his order in the quiet of his home, instead of waiting in line before a seed-counter. That our efforts have been successful is proved in that we now have the largest mail-order seed business in the world.

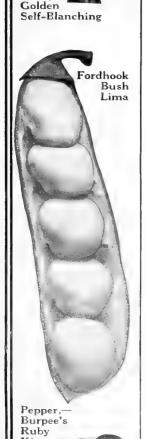

More than thirty years ago we decided that to secure seeds of the best quality it was necessary to produce on our own farms specially selected stocks, and this intensive work is now being carried on to a greater extent than ever before.

Fordhook Farms is the home of many special stocks in vegetables and flowers. At Sunnybrook Farm in South Jersey we specialize in tomatoes, peppers, cucumbers, muskmelons, watermelons and squashes. Floradale Farm, our California ranch in the Lompoc Valley, is famous as the California home of sweet peas. Vast areas throughout the United States are devoted—subject to close personal inspection—to producing seeds of the Burpee-Quality. Great Britain and Continental Europe contribute large quantities of the varieties that are there grown to the highest state of perfection. To garden intelligently you should know the seeds you buy.

The Revised Edition of our Thirty-Fifth Anniversary Supplement portrays by pen and picture the methods of the House of Burpee.

# BURPEE'S ANNUAL FOR 1915

This "Silent Salesman" is a bright new book of 182 pages, with hundreds of illustrations and carefully written descriptions of vegetables and flowers. It it a safe guide to success in the garden—of real value to everyone who plants seeds either for pleasure or profit.

# Making the Garden Habitable

By Prof. Frank A. Waugh, Massachusetts.

These different views of the purpoles of a garden lead to very different methods of design and treatment. If a garden is to be part of the house it must first of all have privacy. We cannot live our family life in the garden if the spaces are left open to the ob--ervation of all the neighbors and of strangers passing

Such privacy is secured in old-world gardens by high walls of brick or stone. It is not feasible in this country to adopt such exclusive habits, but at any rate we can do much in the direction of domestic privacy by simpler means. Hedges and screens of trees and shrubbery are the most natural and often the most effective means of shutting in the garden and shutting

After a certain amount of privacy is secured the garden next needs some furnishings. An unfurnished garden is as dreary and hopeless as an unfurnished

A FORMAL GARDIN WITH PERGOLA AND FURNITURE

Now our American gardens are largely unfurnished. All the furnishings necessary for family life, for human comfort, for interest and entertainment are completely lacking. Our common talk about gardening

A HABITABLE CORNER OF A PERGOLA

completely ignores furnishings, concerning itself simply with trees, shrubs and flowers.

The point at which American life first breaks through toward the garden is on the family porch.

FOR AN ORNAMENTAL GARDEN STONE SETTING IS EFFECTIVE.

We often talk about porch life, which is a kind of outdoor life halfway between the garden and the house. At any rate there are many families who are unwilling to shut themselves up quite within the four hard

We are a letted to the Wigner Linds po Service B Hunk & Atlans, Hartman-Sanders Company and Galloway Terra Cotta Company for the illustrations here reproduced.

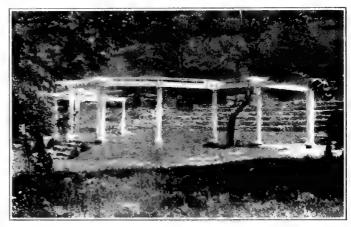

walls of the house, and who find some relief and refreshment on the porch. They read and visit there, serve tea, and some even play bridge. Many progressive people have sleeping porches whereby they project the daily life halfway into the garden.

Now this porch life simply represents one stage in

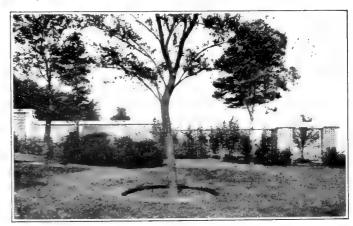

A SPITTER UNDER A LARGE TREE MAKES A COZY NOOK

progress. The next and natural stage would be to move further into the grounds and to get more of the sky. Also more of all the joys and satisfactions of outdoor living.

OUTDOOR THEATRE WITH TERRACED TURE SEATS

In modern garden magazines we read a great deal about pergolas. As I understand a pergola, it is an architectural figure primarily designed to connect an outlying architectural element with the main house.

LATTICE PEXCE SERVING AS WIND SHIFTD AND TO OBSTRUCT AN UNDESTRABLE VIEW.

It is a distinct extension of the dwelling house. It should furnish more or less shelter. Its whole tendency is to carry domestic life farther into the garden. Of course we must allow that, as fashionable pergolas are designed, they do not always accomplish this end, but I am suspicious that the pergola has not always been fully understood by the architects who did the planning or the suburban dwellers who paid the bills.

It is hard to tell the modern fashionable pergola in all cases from the old-fashioned arbor or summer house. My own notion is that there should be a difference in that the arbor or summer house should always be a detached unit at some little distance from the main dwelling. Whatever the name of this detached shelter, whatever the architectural style, whether simple or elaborate, whether cheap or expensive, its real purpose should be perfectly evident. It is to supply another attraction in the home grounds. It should serve as a place where people may stop and

have musical or artistic tastes. Or the place may become a children's play house, and may indeed be designed primarily for their enjoyment. If the place is so fortunate as to abut upon a lake or practicable stream, the family will of course want to keep a canoe or a motor boat, and these would call for a boat house, which may in its own way become the center of the outdoor domestic life. In fact, anything which will add interest to the outdoor life about the grounds is to be considered a part of the garden and to be provided for frankly in this way.

The creature comforts of life depend largely upon seats and tables. If the garden is really to be inhabited, there must be places to sit. Perhaps the most necessary furnishings of all are seats. In this respect our American gardens are sadly unfurnished. Such few garden seats as we see are obviously intended for ornamental effect and not for comfort. I remember well the German garden of Willy Lange, instructor in

THE CHILDREN'S PLAYGROUND WITH SHELTER HOUSE, WADING POOL AND SAND PIT. THEY SHOULD BE FOUND ON MORE OF THE PRIVATE GROUNDS.

find rest, shelter, and an outlook upon the beauties of the garden. It should be in its way quite as useful a part of the home as any room in the house. In it we might carry on many of those pleasant domestic diversions which now occupy the porch. We may play cards there or serve supper, or visit with the dog. A man might even meet his children there and become somewhat acquainted with them.

The fact is, that many of these different architectural garden features differ from one another chiefly in their names. Their purposes are exactly those already described. That is, they serve to ornament the garden, to add interest to it, and to give opportunity for various daily activities outside the house, but still within the home. Thus, if we were to speak of the tea house in the garden it need not be anything essentially different from an arbor. It may mean that we will serve tea here on pleasant afternoons during the summer, or it may not.

In like manner the garden shelter may be called a music house or a studio, if members of the family

landscape gardening, who lives in one of the suburbs of Berlin. In his snug little home-garden of about an acre there were nine different stations furnished with seats, and at six of these convenient stops tables were added. No one could visit the garden without lingering somewhere to sit and chat, and usually to have some refreshments served. This garden was meant to be lived in.

Tables and seats therefore ought to be furnished in every garden just as they are inside the house. They should be placed at the most effective points, that is, the points of best inlook and outlook. There should of course be seats and tables in most of the garden shelters whether those shelters be called tea houses or studies. There may be seats and tables under shady trees in sequestered nooks, and at all points where fine views are to be seen.

These seats and tables may be of any character. The fine classic marble tables and seats which we see especially in our American formal gardens are not to be criticised. They are perfectly good in their way.

We ought to have more of them, and better ones. At the same time it must be admitted that they are not very comfortable for use, and what we are thinking of now is more particularly seats and tables which may be used with the greatest possible creature comfort. The rustic chairs and tables of the past generation were almost as useless from this standpoint as the Italian marbles of the present fashion. What we need is something plain, substantial, attractive, and, above all, comfortable.

Several styles of landscape gardening have insisted strongly upon the introduction of water into every garden. The famous Italian gardens practically never omitted the water features. It is said that the classical Japanese gardeners insist upon the presence of water in some form in every garden scene. We all know how greatly water adds to the charm of every garden, and we may well make suitable sacrifices in order to

secure such great advantages.

Whatever form the water may take, it adds materially to the interest and often to the practical comfort of the garden. Every place which is fortunate enough to have natural ponds and streams has therein a very great resource. Such features should be played up for all they are worth. They should be developed not merely for the artistic effects which they will produce, but for the practical satisfactions which they may bring into the daily domestic life in the garden.

Then there are fountains. Perhaps the fountain is the most effective way, pictorially speaking, of presenting water within the domestic garden. It appears that our American ideas of fountains are highly inade quate, being founded chiefly upon the cast iron squirtguns and dribbling geysers introduced years ago. It

requires a fairly good designer to make an artistic fountain, and features of this emphatic character should be introduced into any garden with a great care. A really successful fountain, however, is a joy forever. and no opportunity should be omitted which might yield a good result in this character.

We may speak a special word for bird fountains. A water offering satisfactory to the birds can be made

without enormous expenditure for engineering or for the services of a sculptor. Inasmuch as birds are a most attractive embellishment to any garden where they may be brought in, and as the bird fountain may be an attractive feature also in itself, this idea is worthy of special study.

A quiet pool, either formally or informally treated, may become also a most attractive feature of any garden. It offers an opportunity for growing many beautiful plants which otherwise would be inadmissible, it multiplies the garden picture by its reflections, and in every way it brings into the garden those gracious sentiments and sympathies which are most required

to make the garden a success.

After all is said and done, a garden is partly ornamental as well as useful. It must be beautiful and full of pictures. In building up these pictorial effects it is often desirable to introduce furnishings of a purely ornamental character, and such as do not have any justification in actual utility. Garden statuary has always been a subject of consequence. While statuary has been used mostly in formal gardens it can also, with some careful study, be introduced effectively into informal gardens. It is quite unfortunate that the art of the sculptor is so poorly patronized, and consequently so meagerly developed in our country. If we were able to have appropriate statuary at the prices which people of moderate means could afford, we could readily add much of interest and beauty to our

Simple columns of stone, marble, or even of wood, serve to add effect to certain points in gardens. This applies especially to the design of formal gardens, but

is open for consideration elsewhère.

The sun dial has come to be a favorite fashionable garden feature. The gazing globe is just as useful and sometimes more attractive, though there seems to be less literary interest in it. Then at various places throughout the carden we may use vases and bowls of all sorts for potted plants and other purposes.

V bird house may become a striking and attractive feature of the garden; and if we undertake a definite campaign for the attraction of birds this would be a

very natural line of development.

The garden gate lass o much sentiment attached to it that one only has to mention it to commend it. In fitting the garden with those accessories most comsatible with human life and enjoyment, there should be

now and then an artistic gate.

Garden furnishings of all sorts have been rare and expensive in this country. The expense of getting good furniture h s accounted in many instances for the unfortunate conditions of which we have already complained. Of coarse, it is impossible to get the finest kind of statuary, the best kinds of fountains or Leautiful marble seats except upon payment of relatively large sums. Such payments would be wholly justified in many cases. They would not be out of scale as compared with the cost of similar furnishings

Some of the fashionable garden furniture is made of high grade lumber and painted or enameled white. Such pieces, if well designed, are extremely effective artistically. In many situations, however, it is quite as practical to make furniture of heavy rough lumber in the undressed state, leaving this to take its own color by weathering, or staining it with dull neutral stains. Considerable ingenuity and practical sense are required to design and build furniture of this sort. It is a field in which American gardening has not experi-

mented sufficiently.

# Horticultural Progress in the United States

By the Late Peter Henderson.

The first botanic garden of which we can obtain record in this country, was established in Philadelphia by John Bertram in 1728, which gave an impetus to horticultural taste in that city that enabled it for many years (probably up to 1850) to claim the possession of the finest collection of plants, both private and commercial, of any city in the Union. New York started later. Although we find that, as early as 1750, places were advertised for sale on Long Island, and among the inducements offered to purchasers it was mentioned that they had "flower gardens attached"; and in 1756, others were offered as having "greenhouses filled with tropical plants." To show indisputably that there was some general taste for floriculture at that early period, we find that in 1751 a pottery at Whitestone, L. I., is under way, and advertises that "any persons desirous may be supplied with urns and flower pots to adorn their gardens." In 1767, William Prince, of Flushing, offers a great variety of fruit trees, such as pear, apple, peach and plum, packed so that they can be safely sent to Europe; and later, in 1774, in the New

TITE OF THE HEALTH NO. RSON

York Mercury of that year, this enterprising horticulturist advertises that he has added ornamental trees to his grounds, and offers "the Magnolias of the Carolinas and other rare trees and shrubs.

Mr. Prince was an enthusiast in all departments of horticulture, and by the beginning of the present century had added to his nursery of fruit and ornamental trees a greenhouse department, which contained a very full collection for that time. In a "Short Treatise on Horticulture," which he published in 1828, he describes 37 varieties of camellias, 13 species of amaryllis, 90 varieties of dahlias, and 67 species and varieties of pelargonium, as being a portion of his collection. The Prince Nursery at Flushing was then known as the Linnean Botanic Garden, and had, by the wonderful

energy of its proprietor, a rare and interesting collection of trees and plants, some of which were eventually lost to cultivation, until again introduced here from Japan, by Mr. Thomas Hogg, notably among which was the Japanese persimmon, now attracting considerable attention as a new fruit for our Southern States.

Another botanist, Dr. David Hosock, started the Elgin Botanic Garden in this city, in 1801, and in his catalogue for 1811, nearly 3,000 species of plants were described, among which 500 were greenhouse exotics. The curator of the Elgin Botanic Garden at that time was a Mr. Dennison, who began business as a florist in 1814, in this city, at a point near where the Fifth Avenue Hotel now is, and which at his death, in 1822, was leased to Thomas Hogg, who was the father of the present Thomas Hogg, to whom the world is so much indebted for his valuable introduction of Japanese plants. A Mr. William Wilson, a contemporary of Thomas Hogg, was the author of a book on Kitchen Gardening, and was, with Dr. Hosock, one of the originators of the first Horticultural Society in New York, in 1818. Another prominent horticulturist of that day was Mr. Thomas Bridgeman, who kept a seed store at Seventeenth street and Broadway, which is still managed by his descendants. Mr. Bridgeman was the author of the "Gardeners' Assistant," a work having a large sale, to which hundreds of European gardeners, on coming here unacquainted with the American climate and plants were much indebted. By 1840, commercial horticulture had come to be liberally patronhad been estalished of considerable extent in Long markets were fairly supulied with fruit a flowers, and vegetables, but meagre heleed to what they are tody v. The advancement in floriculture has been much the greatest. In those days the gorgeous designs formed by cut flowers, now such a feature in all our large cities, had no existence, and the wonderful plants of the tropics now seen in such profusion and variety emmost unknown. In nothing, perhaps, has horticulture advanced so much as in the beautiful designs that cut flowers are made to form, and which in New York today are unsurpassed by any city in the world.

In 1844 the writer was an assistant in one of the then largest floral establishments in New York City. If a wreath was to be made, its base was usually a piece of willow or a barrel hoop; if a cross, two pieces of lath formed the groundwork, and the work, when done. was usually such as reflected but little credit on the artist. Bouquets were then about the only style of design in cut flowers; these were usually made flat or one-sided, the groundwork being arbor vitae, through which the stems of the flowers were drawn. Bouquets made round were rare, for floral art had yet developed but few fitted to cope with such an undertaking, and the few who did made poor work indeed. Our sales of flowers at that establishment for New Year's Day in 1844 amounted to hardly \$200; and probably for the whole city of New York it did not exceed \$1,000. Now, it would probably be no exaggeration to say that New York pays \$50,000 for its flowers for decoration on that day, and that its trade for the year for these perishable

commodities runs into the millions.

It is estimated that there are 500 florists' establish-

<sup>\*</sup>An essay read before the Horticultural Scriety of New York by the late Peter Henderson, March 9, 1886. The beginning of the twentieth century is witnessing Mr. Henderson's hopes realized, for New York has aroused an interest in horticulture.

ments within a radius of 10 miles from the City Hall, New York, and that the capital invested in land, structures and stock, is not less than \$8,000,000, the product of which is mainly for New York City alone; and when we consider that New York contains only about one-fiftieth part of the population of the United States, and that horticultural taste is certainly not higher here than the average of the country, it will be seen that the business of floriculture alone, without taking into consideration that of fruits or vegetables, is one

of imposing dimensions. There is but little doubt that in nearly all the manual operations necessary in horticulture we are in advance of Europe; and no better evidence can be had in proof of this assertion than the fact that the cultivator gets one-third less for his products in the markets of New York or Philadelphia than these same products bring in London or Paris, though the price paid for labor is one-third higher here than there; nor does it tollow that the cultivator here works at less profit for he does not; so that the only solution of the anomaly is, that our necessities have compelled us to make such progress in our operations that our crops are produced with less labor. For instance, when in London in 1872, I saw twenty men in one squad digging the ground in one of their market gardens with spades. For the past thirty years there was not a market gardener on Long Island or in New Jersey who would allow his ground to be dug with a spade, even if done for nothing, for he knows that the plow and harrow will pulverize the soil better; but John Bull, in the neighborhood of London, at least, had not found that out in 1872. It is, no doubt, the tenacious adherence to such primitive methods that is making Europe in

many of the industries of the day play second to the

United States. Yet it must be admitted that in some phases of horticultural progress we are yet far behind Europe, particularly in the ornamentation of our public grounds. We have nothing to compare with the Battersea Park, London, the Garden of Palms of Paris, or the Phoenix Park, Dublin; and when comparison is made of the grounds surrounding the villas in the suburbs of these European cities with our suburbs here, the comparison is, if possible, more against us, for there it is rare to see a neat cottage without a well-kept lawn and good taste shown in the planting of its flower beds, its welltrimmed fruit trees and neat vegetable grounds. Here, as yet, we have hundreds of expensive mansions, particularly in the suburbs of New York where the socalled gardens surrounding tell all to plainly the necessity for a better school of horticulture. We can excuse the wife of a day laborer planting her seeds of morning glory or lady slippers in the potato or corn patch; but when the owner of a \$10,000 cottage has the vulgarity to invade his flower beds with beets and tomatoes, he is carrying his utilitarian principles beyond the bounds of ordinary good taste. But against these instances of coarse taste, happily getting less each year, we have hundreds of cases where the decoration of private grounds by flower beds not only shows the refinement of the owner, but at the same time gives pleasure to thousands of the people, to whom the adornment of the parlor is as a sealed book.

Within the past ten years the style of decoration known as "ribbon lines" or "massing in colors," has made great progress, and is well done in the public parks of Boston, Philadelphia, Cincinnati, Baltimore and Albany, and is a never-failing attraction to strangers on a visit to these cities; and to none more than those from New York, for the feeble attempts at

flower decoration made by our Central Park, or the Prospect Park, Brooklyn, has hardly been such as to make them aware that the thing has ever been attempted. But if our commissioners are so far behind those of our sister cities in making our public parks attractive, private enterprise, we are happy to say, is not.

Llewellyn Park, Orange, N. J., owned by private gentlemen, has scores of villas unequaled in decorative planting, and the extensive grounds of Mr. Hoey, of Long Branch, N. J., Mr. Sargent, of Fishkill, and Mr. Dinsmore, of Stattsburg, N. Y., and many others less publicly known, are models of gorgeous beauty during our summer months, and offsets, to some extent, the inefficiency of those in charge of our public parks, who so poorly appreciate the public wants.

Boston, Philadelphia, Cincinnati, Baltimore, and Albany have not only left us behind in the decoration of our public parks, but the three former have advanced far ahead of New York in matters connected with societies for the advancement of horticulture; although, as I have before stated, our first New York Horticultural Society was started in 1818, it can hardly be said to have been a long-continued success. For many years it passed out of existence, till resuscitated as our present society in 1876.

The Boston Horticultural Society was started in 1829. Its hall, costing about \$250,000, was built in 1865. The society has had almost unvarying success from the start, and particularly since the erection of the hall in 1865.

The Horticultural Society of Philadelphia was begun in 1828. Its first president was the well-known Horace Binney, and, among the members of the acting committee in 1829, we find the names of Nicholas Biddle, Robert Patterson, Caleb Cope, and David S. Brown, who were at that time the leading citizens of Philadelphia. The building of the Horticultural Hall was completed in 1866. It covers a plot 75 x 200 feet, and cost \$221,000. As in Boston, the erection of a building for the special use of the Horticultural Society gave a great impulse to the work in Philadelphia.

The Department of Horticulture in the Cincinnati Industrial Exposition last year gave \$5,700 in prizes; and on the days on which there was special floral displays the receipts at the gates averaged \$3,000 more than on other days.

There is no question that the successful condition, so long continued, of the Horticultural Societies of Philadelphia and Boston, has had much to do in accounting for the more general taste displayed both in the public parks and private grounds in and about Boston and Philadelphia than at New York. Without some centering point where new or rare products can be exhibited for comparison or competition, no individual effort, by advertising or otherwise, can bring them before the public; thus the finest or rarest specimens of fruits or flowers may be hid for years, or even completely lost to the world; or, on the other hand, articles without merit may be offered for sale, either through the ignorance or dishonesty of the vendor. But this, in places where there is a live horticultural society, can never be done to any great extent; for without the society's stamp of merit, the sale must ever be limited.

Our New York society is now in a fair way to emulate Boston and Philadelphia, and before long it is to be hoped, we will be in a condition where our influence will be so felt that we will no longer be ashamed of comparison with those or with any other cities of the Union.

# Is the Chrysanthemum's Popularity Waning?

By Wm. Kleinheinz,\* Pennsylvania.

Year after year we hear the same prophecy—"The chrysanthemum is losing its popularity." We hear it regularly every fall and yet a visit to any of the wholesale florists' establishments, the greenhouses of the commercial growers, or last, but not least, to the private conservatories, or gardens, when this beautiful flower is in bloom, will quickly convince you that the predictions, "mums are going out," are uttered by false prophets. It is true that some years ago in Boston and some other

"ODESSA" GROWN OUTDOORS AT OH FIELD, CAL.

cities interest dwindled somewhat in the large chrysanthemum blooms, but in the last few years interest has been renewed in them to the extent that their popularity is greater today than it ever has been.

As an exhibition flower there is nothing that can compare with the large flowering chrysanthemum and, to my mind, there is no comparison between the spring flower shows and the chrysanthemum shows in the fall. A spring flower show, of course, has this advantage, that hundreds of varieties of different flowers can be had in bloom whereas the selection in fall is restricted to a much smaller choice, but the chrysanthemums, their different shapes, the various shades of color and their increase in size year after year make the shows at which they are exhibited always most interesting.

Another superiority of the chrysanthemum over all other flowering plants is the manner in which it can be grown into large specimen plants. Nothing in all cultivation is so attractive as a well-grown specimen chrysanthemum plant. Just think of the wonderful specimen plants annually exhibited, at the fall show of the Horticultural Society of New York—fourteen feet in diameter, with over fourteen hundred blooms to the plant. Let me also refer to the chrysanthemums grown to single stems

in six-inch pots, which are to be seen at every chrysanthemum show and which always elicit much favorable comment.

I have plenty of evidence at hand that our large commercial growing establishments are finding the demand for the large flowering chrysanthemums increasing enormously yearly, and there appears to be no sign in sight of the demand diminishing.

The single chrysanthemum I would place in a class all by itself. During the past ten years wonders have been wrought by our hybridizers and raisers of those magnificent flowers. Not only for grouping arrangements, as they are frequently used at our shows, but for many other kinds of decorative purposes, can these flowers be effectively used, in planting out in the open.

The pompon varieties are not quite as suitable for outdoor planting as they flower somewhat later, but they are also a strong factor in the garden when used for a border or for mass planting. Some years, when overtaken by heavy early frosts, the pompons do not have a chance to mature to their full beauty, but under normal conditions some very fine outdoor displays can be had. The pompons are also grown quite extensively under glass and are a good addition to the single and large flowering mums. But of all the different kinds I must proclaim the large flowering chrysanthemum the leader of them all.

Our growers and hybridizers in this country as well as abroad never rest and year after year improvements over the great existing varieties are introduced and varieties we thought well of a few years ago are forgotten and replaced by superior ones.

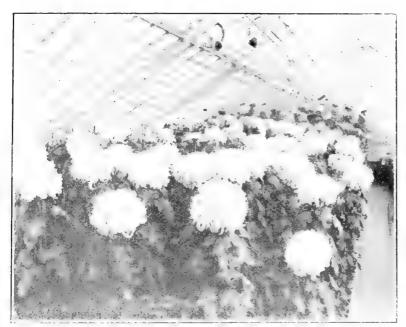

The fact that the earlier and single varieties are becoming more popular does not mean, as some people seem to think, that the large 'mums have seen their best days,

WM TURNER GROWN UNDER GLASS IN OKLAHOMA

and that they are not grown as much as in previous years: it simply means there is a broader interest being taken in horticulture and a more general interest in chrysanthemums and that everyone grows the type he can do the best with.

I will venture this assertion, which I believe is a safe one to make, and that is, that the number of people growing 'mums both indoors and in the garden has never been equalled in the past.

PARTON OF TRANSPORTERS OF THE STATE OF THE S

### TRADITIONS OF THE FATHERS.

Since the history of the human race has been recorded, and before, folk lore has been handed down from one generation to another, sometimes with additions thereto, sometimes with substractions therefrom, but always interesting to the student of the history of the development of man in his struggle for greater attain ments, in science, art, political freedom, and religious liberty.

There is but one phase of the subject which we have any desire to refer to at this time, namely, that which pertains to the art of gardening.

We shall not go further back than 1717 when greenhouses were first constructed for the cultivation of exotic plants. The greatest perfection in the art has been attained in England and Belgium; both countries characterized by a humide climate. It is from these lands across the sea where horticulture has been

been attained in England and Belgium; both countries characterized by a humide climate. It is from these lands across the sea where horticulture has been studied and practiced for three centuries that our most proficient gardeners come, and with them they bring as a rule the traditions of the fathers, and it is a marvel how tenaciously they cling to them, with little patience for the fellow who dares to do otherwise. The late Peter Henderson, a Scotchman of keen perceptions, was the first to break away from his early training, and establish a new order of things in the land of his adoption. That was on the Atlantic Coast two score years ago. And what a stir he made among the professionals who did as Dady did, or as the head gardener of some estate in the old country had taught them to do. He revolutionized the whole system of propagation of plants, which had been followed up to the time in

the horticultural world, and the publication of his books.

so simplified the art that it took the breath of his critics from them.

This same class of gardeners have been attracted to this part of the heritage of the children of men, and with them they have brought their traditions, though climate and country is radically different from the land of their nativity, and working conditions not at all ike those under which they learned. We shall point out some of the errors which they were taught, and fondly

cherish. When making cuttings of either soft or hard wooded plants it had to be at a node or joint, and the propagator who dares to do otherwise is a heretic. As a matter of fact the most successful propagator of the rose from out door grown wood never thinks of making a cutting at a joint. There is no necessity whatever for making Poinsettia cuttings at a joint. The hollow tube between the nodes will root as readily as those made in the old traditional way. Grape wood, cut to single eyes, with two inches below the eye will, if placed in clean sand and given a gentle bottom heat, root as readily as when two eyes are used, the lower eye close to the cut.

Then there is another tradition that these gardeners cling to with the tenacity of life: a blue grass turf. They must have a turf to be happy, and blue grass at that, no matter if the days are bright, and the atmosphere dry as the breath of an oven after the bread is baked. No matter how much water it takes or who pays the bill for supplying it, they must have a blue grass turf, in a desert land, or be disconsolate.

With all due respect for the fathers, may we never forget the fact that they lived up to the light they had, and while we revere their memories, we live in an age of progress, and in a land wholly different in every particular from that in which they lived and wrought.

We have heights to climb and depths to explore from a horizotteral manual view, it which the convergeven dreamed. -Pacific Garden.

## THE HORTICULTURAL SOCIETY OF NEW YORK.

Attention is again called to the Fall Exhibition of this society, which will be held at the American Museum of Natural History, November 4 to 7. Schedules are now being prepare I, and will soon be ready for distribution. That preparations may be made for the exhibition of bush plants, the premiums offered are given below:

### CHRYSANTHEMENS PLANTS. SPECIMEN BUSHES.

GEORGE V. NASH, Secretary.

# The Phipps' Hall of Botany, Pittsburgh, Pa.

the School of Botany which, with the Phipps' Conservatory, Schenley Park, was presented by Henry Phipps to the city of Pittsburgh, was erected in the year 1991 at a cost of \$25,000.

The object in providing this institute was to stimulate interest and the love of plants and flowers among the pupils of the high schools of the city. To say that the object was realized is putting it very mildly, as the influence is very narked in the younger people

to accommodate 80 pupils in the nam hall, and 50 in the Lasement.

The Phipps' Hail of Potany is a most delightful place for carrying on work in the fine of Lotany. The hall is attractive, well lighted, arranged for laboratory and lecture work. Its equipment includes twenty compound microscopes, simple lenses, dissecting instruments, etc., and a fine reference library donated by Mr. Phipps. Ample material to carry out the work is furnished by

the Superintendent of Parks, George W. Burke, from the Phipps' Conservatory, comprising among other things the fol-

Horee mouths Date enteracties . terms constraints showing out, eraporal area in distance, stayer as the yeas, reans, corn, squash and radiobes in different stages or germination, and mosses in fruit.

Spira in nths Lulip. No issues. Crosus, one Hyacath Litts and dis soms, Cineraria, Isalea, Gemstra, Rhododendron, Tobacco, Apple, Cherry, Peach, Plum, Red-bud, Dandelion Iris

Fall months: Petunia, Snap-dragon, Hibiscus, Canna, Salvia, Columbine,

doubtrel whether there is another city familiar with plants and flowers and take so much interest in them, as do those of Pittsburgh. An evidence of this is the enormous crowds that visit servatory during the year, and the fine appearance of the grounds surrounding the private residences of the city in the spring and summer months; not the homes of the rich alone, but the comparatively poor as well beautify their homes by planting bulbs and flowering plants. The combined influence of the conservatory and school has been the means of beautifying the city, and has increased the florists' trade by creating a greater demand for plants and cut flowers.

The attendance at the school increased in a few years to over one thousand students a week during the school term; making it necessary to remodel the basement at a cost of \$3,000. Originally it was thought that one hall on the main floor would be large enough to accommodate all the students of the different High Schools of the city, using the basement for a class room only, but in course of time the population increased and one hall proved to be inadequate, so a committee was appointed to call on Mr. Phipps for further assistance. He generously paid the expense of the remodeling and now the Phipps' Hall of Botany, as it is called, has a seating capacity and desks

ARPANGO FOR THE TERRISON OF THE OPEN OF WEST

Milkweed, Cassia, Canna, Caster-oil, Locust, Maple, Allanthus and Jimson-weed pods, Chinese lantern, Bittersweet, Rose-lip, Snowberry, Osage Orange, Quince, and Haws fruit. Ash, Maple, Sycamore, Horse-chestnut. Ginke, Locust, Poplar, Tulip-tree, Cassia, Iris and Canna

The scope of the studies carried on in this school of botany embraces the germination of seeds; experiments to show the use of root, stem and leaf; the flowers and fertilization; cross-pollination; the fern life history; food storage in bulbs, etc.; fruit and its distribution; microscopic study of cells and wood structure; propagation by spore, seed, cuttings, grafts, bulbs; modification

of leaves for protection and food storage and many relative topics.

No city in America has such an opportunity for creating a love for plant life, and an intelligent interest in its conservation as has Pittsburgh, through the generos-

ity of one of its citizens.

Standing in close proximity to Phipps' Hall of Botany, and in front of the Phipps' Conservatory in Schenley Park, is the Robert Burns' Monument, which was accepted by Mayor Jos. C. Armstrong on October 27, 1914, on behalf of the city of Pittsburgh, as a gift from Andrew Carnegie, David M. Kirk, George Lauder, James H. Lockart, Thomas Morrison, Alexander R. Peacock, James Scott and the late Robert Pitcairn.

## PHYTOCHEMISTRY TO SOLVE OUR SOIL PROBLEMS.

By W. A. Hamor, Pennsylvania.

There has long been a certain antagonism of interest between agriculture and industry, both supporters of national welfare. The gulf which at one time threatened to separate them, would, no doubt, have become a barrier to cordial relations, owing to the more rapid progress of industry, had not chemistry, now the inteligence bureau of both, come between them as the mediator at a most opportune time. To quote one of the most eminent organic chemists, Herman Kolbe: "It seems marvelous and almost incredible to the uninitiated that, after a pursuit of agriculture for thousands of years, and after the establishment of the general belief that agriculture was being rationally carried out on the basis of a thousand years of experience, a chemist, who had never been a farmer, had never held the plough, never tilled the ground, should from his desk teach the agriculturists how to treat the soil, in order to impart to it constant productivity; and that only through Liebig's doctrine of the treatment of the soil and of the natural laws governing the cultivation of the ground, a truly rational system of agriculture has been inaugurated.

Agriculture has, in fact, now become applied phytochemistry, the chemistry of plants, and agricultural production ultimately rests upon the same chemical laws and operations which are employed in laboratories. It is therefore to the phytochemist that agriculturists—and florists and gardeners are members of that family must turn if they intend to be careful to further and increase the growth of plants, especially food plants, by supplying them with just the substances which the soil cannot offer to them in sufficient amount. The remark of the late Marquis of Salisbury is apropos in this connection: "If farmers would only manure their land with brains. . . there would be much less heard about agricultural depression." This utterance with that of Dean Swift—that "the man who makes two ears of corn or two blades of grass to grow, where only one grew before, is a great benefactor to his country"-will indeed always constitute the practical principles guiding the relation of chemistry

to agriculture.

The progress of agricultural research in the United States has been notable. The results of practical importance already attained have inspired the public with such confidence in the value of this kind of investigation that Congress and the State legislatures have been very liberal to the Federal Department of Agriculture and to the 63 experiment stations distributed throughout the country. Hand in hand with agricultural progress has been a constantly growing demand for well-trained workers in agricultural science, for the man-

agers of business enterprises requiring scientific knowledge and skill have awakened to a much clearer appreciation of the value of the services of such men.

Agricultural chemistry forms, of course, a basically prominent part of the instruction in agriculture at the various State colleges and universities, but, if we except the very superficial treatment of the subject as given in courses on pharamacognosy and materia medica at the schools of pharmacy, phytochemistry, the chemistry of plants in its broadest aspects, does not have a part in the curricula of our universities. The courses offered in agricultural chemistry at the State universities usually consist of instruction and practice in the *analysis* of soils, fertilizers, plants, feeding stuffs, and rain and drain waters; and little or no time is devoted to a study of the chemistry of the important

RÖBERT BURNS MONUMENT, SCHENLEY PARK, PITTSBURGH, PHIPP'S CONSERVATORY IN BACKGROUND.

substances occurring in plants, of the technology of plant products, and of the soil as a medium for plant life. This may in part be excused by the confused state of that vague mixture known as agricultural chemistry; but since the foundations of this subject have now been critically examined and the important evidence has been weighed, the time seems ripe for the introduction of phytochemistry into the courses of study of the higher institutions of learning.

At the University of Pittsburgh, a course in the chemistry of plant growth as governed by soil conditions and constituents, is offered for 1915-1916 in the School of Chemistry. This course, which is intended primarily for graduate students, will consist of lectures and laboratory field work, under the direction of an expert phytochemist, on the conditions governing plant growth. The object of this course is to afford an opportunity to the advanced student of chemistry to familiar-

ize himself with the very important work now being done on the various phases of this subject. A previous knowledge of agricultural chemistry is not a prerequisite and the actual working of the course will be arranged to suit the requirements of special groups of students. Through the courtesy of George W. Burke, Superintendent of Parks for the City of Pittsburgh, ample space and facilities for experimental work in the Phipps' Conservatory have been placed at the disposal of the University for instruction and research in phytochemistry.

At the present time the division of phytochemistry of the School of Chemistry in the University of Pittsburgh is conducting an investigation of the so-called catalytic and colloidal fertilizers, and the results promise to be of great practical importance; during the course of this inquiry, a thorough study is being made of the stimulating effect on plant growth of the rare and radio-active earths, various mineral salts, and organic compounds, and already very interesting conclusions have been made.\*

By pursuing a recommended course of training at the University of Pittsburg, young men may become fully equipped soil chemists, and probably no career is so full of possibilities as this one. Such chemists are qualified to carry out investigations of soil problems and to act as advisors to practical agriculturists. The School of Chemistry of the University of Pittsburgh is endeavoring, with its strong staff and unexcelled equipment, to supply this training.

"A full report of this research will appear in these columns later.

## Bird Protection and Its Scope

By Paul B. Riis, Illinois.

While the hanging out of nesting boxes and the proper feeding of birds are very necessary, there is other important work that must be done—work that does more than all else to induce birds to stay.

This work is difficult in its solution and consists in creating places of absolute safety by removing the bird enemies, of which the English sparrows, cats, chipmunks, flying squirrels, and sometimes squirrels are the principal ones.

The part played by chip-munks is not generally understood. Here in Rockford where birds have been attracted in the parks for several years we find the chip-munk appropriating the nesting boxes for store rooms, thus depriving the birds of a chance to use them. Their habit of sucking eggs also is conceded by some naturalists. The flying squirrel, so little in evidenece, not only shows a great partiality for nesting boxes, but also ruins these boxes for all time to come, for the species of birds they are intended for by gnawing the opening to such dimensions as to admit him comfortably. Little is known of his depredations with eggs. Fortunately his nocturnal habits compel him to seek repose in day time and it is a small matter to surprise him in his nap and straighten out matters. Squirrels fail to fill any particular place in nature. Their habit of building nests in hollow trees and limbs deprive birds of a safe nesting site, and close observations will soon convince you that they are not desirable. No excuse exists for their wanton destruction of nests, eggs, young and old birds. but possibly individuals are at fault more than the entire

After considerable investigation and actual experience, boxes made of lumber will be discontinued. The Baron von Berlepsch boxes cost but little more to construct; they are more durable and vandal proof and more in keeping with their natural surroundings. They offer natural nesting sites scientifically arranged and will be used by any bird that builds in boxes. Flat bottom board boxes are practically useless for wood-pecking birds. The von Berlepsch box overcomes all these objections. Waste material from cut-down green trees is always obtainable. However, it is about as cheap to purchase these boxes as it is to make them.

Time and money expended in providing for our feathered friends is a good investment. The work of treating trees for borers is more expensive than to provide for birds that are better able to do this. They work without compensation, intelligently and faithfully. No larvae or

egg masses escape their scrutiny. Many flat and round headed borers learn to their sorrow of the birds proficiency in searching them out. The brown creeper in his daily rounds goes up a tree, ably seconded by the downy, hairy and red-headed woodpeckers, finding everything in their line of vision. The nut-hatch goes down a tree finding everything in his line of vision. This admits of very thorough work and no trunk or limb is overlooked

The weed seed eating birds are equally proficient in their line of extermination. Tree sparrows (not the English sparrow) in Iowa alone are estimated by the government to eat annually 875 tons of weed seeds. There are many other varieties that do as much.

Wrens, robins, blue birds, cuckoos, thrushes, martins, flycatchers, quail, etc., daily eat such enormous quantities of caterpillars, moths, larvae and beetles as to be almost beyond comprehension. The high temperatures of the bird's body necessitates constant feeding, and fledglings will eat their own weight in food daily.

Nature herself has put the birds in the field to act as a check against the innumerable enemies of vegetation. Man has disturbed the balance by depriving birds of the natural nesting sites found in the forest and meadow now shorn bare. Personal efforts to supply the deficiency will help to restore this balance in a measure. The planting of berried shrubs and vines are within the scope of the park superintendent's work. The following varieties are arranged according to the order of their preference by birds: Blackberry, mulberry, Elderberry, black cherry, raspberry, blueberry, dogwood, pokeberry, red cedar, sumac, bayberry, wild grape, June berry, choke cherry, smilax, Virginia creeper, juniper, huckleberry, mountain ash, buckthorn, hackberry, viburnum, barberry, bitter-sweet, euonymus, and partridge berry.

We are now entering upon the third year of bird protection in the parks of Rockford Park district, and the results obtained are noticeable to the most casual observer. Fair Grounds Park, a tract of 24 acres, but eight blocks removed from the heart of the city, fairly teems with bird life. In former years a few robins were the only birds observed there. Last year, blue birds, cat birds, orioles, and even thrushes essayed to build their nests despite the great crowds of people that patronized this park at all times, and many winter birds are with us now. Once you enter upon the work of bird protection you will find it fascinating and a source of perpetual delight.

# Orchid Culture Is No Magic Art

By W. R. Fowkes, New Jersey.

The orchid family is not generally accorded the position is deserves in the floral kingdom, for, although large quantities are grown commercially, a great many gardeners shrink from their culture claiming that orchid growing does not properly come under the ordinary gardener's vocation.

The primary notion is that orchids are very expensive, require great heat, specially constructed houses for their successful culture and that a life-long study has to be given to them; in short—that they are in a class all by

themselves and require a specialist.

Some people also contend that an orchid only flowers once a year. So do many much commoner plants. Take, for instance, the chrysanthemum; it has to be grown for a year in order to get a beautiful show of flowers in the

Orchids can be had in bloom every day in the year, are not expensive to purha et in det, ere ver de sonable

requires great heat and a sweltering atmosphere in the plant house. No wonder these children of the free and open forests rebelled at such unnatural treatment. Some growers treat them in a careless manner and the plants struggle along, and if a flower appears it is a marvel and a wonder. They deserve good treatment and will repay any little attention paid to them. One of the main things in their culture is to keep them clean.

Orchids can be bought from the importers from one dollar upwards, or a few dollars a case, as they arrive from their native habitat and it is a most interesting and fascinating hobby to watch them grow and to look for their beautiful blossoms expanding from what appears to most people to be nothing more than miserable dried up sticks. Unbounded pleasure occasionally occurs from these imported plants when one of unusual variety turns out to be very valuable and a decided acquisition to one's collection.

STECIMEN PLANT OF CALIFFYA PERCIVALIANA

when their usefulness and beauty are taken into consideration. If a proper selection is made no one need despair of having orchids regularly. They are the aristocrats of the floral world and are unrivalled in splendor by any other species.

Many years ago orchids were in the hands of a few rich people in England, and were expensive because the collectors in the wild forests had not learned the proper methods of preparing the green leaved sappy bulbous plants in order to enable them to withstand the long journey of many weeks. The first cultivators also had a set idea, which is still adhered to by many, that the orchid

Orchids can be grown in any ordinary glass house with ferns and palms and some of them even with geraniums. In fact, there is not a greenhouse that some variety will not thrive

A few words about their culture. When and suspend from the permost, or place un-A point to remember is this, that too much heat, light and mois-

With proper treatment they will soon throw out a few roots, and when these roots begin to grow a little they must be sprayed overhead once daily, still keeping the plants in the shade. When the roots have

grown about one inch long they must be potted.

Most varieties will succeed in pans or 34-inch pots. Do not use one size larger than will contain the respective plant for they will be better off under potted. Compost for a mixed lot will be three-quarters peat and onecuarter sphagum moss, with a handful of shredded cow manure to eight parts of the mixture. Firm potting is a very important item, for an orchid loosely potted will not thrive but will dwindle away, due to the open nature of the compost,

A good collection of useful orchids that will give a succession of blooms are as follows:

Cattleyas, namely-

Illustrations from catalogue of Julius Rochrs Co

Trianae, cheens in January and February.
Percivaliana, blooms in February and March.
Mossiae, blooms in April.

MI orchids like the fresh air and require it. The phalactopsis like the most heat and must not suffer in summer for want of water and shade; but in winter they remain a light polition near the glass and no water or drip on their fleshy leaves.

I am growing all the above named varieties in one house along with begonias, bouvardias, gloxinias, and occasionally other subjects, and have flowers every day of the year.

The chief difficulty a beginner has to contend with is the time and manner of resting. Cattleyas require spraying overhead on bright days and when growing well a little weak cow manure is beneficial. When

they have completed their growth, with the exception of gaselliana, Labiata and Gigas, which flower as soon as growth is completed, they must be kept a little drier, and if possible, cooler. Cattleya Schroederae and Mossiae make their flowering growth in summer

1. 7.11 A. 1. 1. 2. 2. 1. 1. 7.21

and must be kept qui tand permitted to rest until March; when the visible buds in the sheath show the plant needs more water. Dendrebium nobile and Wardianem require abundance of water during growth. When finished they must be taken into a color late, which was ed to the sun to relt and ripen must when such cross is turned bads will be seen specifing out; they can then be taken into a term house at intervals to succeed in bloom. Dendre' into I haloenopsis makes growth and flower in the same house at intervals to succeed in bloom. Dendrobial, formorum giganteum is an evergreen orchid and will succeed better in full sunlight. A carnation house is a neighbor with the plant suspen halferm the roof.

FIZDROBHUM IZITZIBIPHTIM TAMISHAZUM

# Conifers—Their Usages, Plantings and Enemies

By Henry Kelly, Connecticut.

Conifers, taken collectively or individually, are as important, attractive and ornamental as any species of tree we have. To make up the collection named in this paper, nearly every country has paid tribute to the collector and we still have many other varieties that under favorable conditions do fairly well. There are many uses we can put them to, such as windbrakes, hedges, screens, backgrounds for gardens, or individual specimens for our lawns.

Nearly every specie requires different treatment and you may well believe that we have more to learn

about the formation and growth, or the habits of Conifers, than of any other

growing plant.

We know that they grow and do well in good soil; we also know that some species do equally well, if not better, in gravelly soil that will not produce anything else. We are inclined to think that the roots find what they require in the soil in the way of decaying rocks, and that the needles gather the nitrogen from the air and pass it down to

the roots thereby.

Darwin has said so sensitive are the ends of the roots in search of moisture that they must have brains; be this as it may, why do not our experimental stations discover, and tell us something about the organs of our trees-what part of the roots are to furnish the various materials needed for the proper development of the tree. If all we need to do is to keep the soil stirred and the tree will provide its own nourishment

water, but if it does not rain—and we mean by rain a good soaking down to the bottom of the rootsthen water once a week and when you do water do it liberally and give the needles a good spraying; after two days stir the ground to a depth of five or six inches, so that the air can get in its work and the roots will start growing. Too much watering will keep the needles green for a long time, but you sour the soil and instead of developing root growth they decay, and the tree dies. Do not spray the foliage in the hot sun.

We must be careful not to plant too deep and, as

AN EFFECTIVE FOUNDATION PLANTING OF EVERGREENS,

A PLANTING OF FIRS, JUNIPERS AND HEMLOCKS.

from the air, we should know it.

We find the best way to care for newly planted evergreens as follows: Keep the ground stirred twice a week. If we get good rains, say once a week, do not

Read Sefore Westchester & Familield Horticultural Society. Illustrations by D. Hill Nursery Co.

often as we can, we should plant in clumps, so that the trees will protect one another. If it could be done it would be an excellent plan to shade from the sun for a few days. Care must be taken not to let the sap harden in the roots, as it will be hard enough to get circulation started through the branches and needles under the most favorable conditions, for once sap turns to resin it will not circulate again. We sometimes get good results from pruning Conifers; this sounds like heresy, but is a fact. If they are to be pruned it should be done with a knife, and not with a box shears, and the work calls for good judgment. When we have a clump planting we should plant the strong, high growing, hardier varieties to the north and west; in this way we can make use of some of the handsome varieties that are not quite hardy, or do not stand our winds well.

There is no more effective planting than the following: Douglas Spruce, Austrian, White and Scotch Pine, Red Cedar and American Arbor Vitea, for the background coming down to Retinospora Plumosa Green and Aurea, Blue Spruce, Umbrella Pine, Swedish and Irish Juniper, Biota, Golden Arbor Vitea, Mugho and

A GROUP OF EVERGREENS FORM A PLREECT SCREEN AND ART BEAUTH UT THE YEAR ROUND

Japan Table Pine, Dwarf Yew, and prostrate Juniper. Plant among these some red Phlox and a few Othat Oragis. With the red Phlox and the yellow Oragis contrasting with the various shades of foliage of the evergreens, you will be perfectly satisfied with the result, and it is what can be called a happy planting.

To keep this good effect you must do some intelligent pruning, otherwise you will have an overgrown tangle. Do not be afraid to trim for the desired results. Often we find it an advantage to root prune, to regulate the growth and shape. We find that when an evergreen over 4 or 5 feet high has been transplanted and we have hot sunny weather, following a long period of cold rainy weather, we are apt to find what we call leaf scorch. The reason for this is that the tree was so recently moved that its root system had not become thoroughly established in the soil and

it is not able to take up moisture fast enough to enable the tree to adjust itself to the atmospheric and climatic changes. More moisture is given off by the leaves than could be supplied at this time, and the leaves collapse; this is the time the expert would be of use, providing he knew what was the matter. Keeping the soil stirred two or three feet around the tree is of great benefit.

An application of fertilizer rich in nitrogen at this time is of benefit when the trees turn yellow or sickly looking. A light sprinkling of nitrate of soda brings back the color to the needles.

We all want to plant trees as large as we can, and after they are planted we never do a thing for them. When a tree comes up naturally from a seed it is able to care for itself, the roots traveling in search of moisture and nourishment.

EVERGRIFNS ARE AUWAYS INTERESTING FUFY WHEN SNOW I ADDAY THEY MAKE THE WINTER SOLVE THE POLICE

An old gentleman once said that in his opinion many trees died of pneumonia, and why not? That is, they are not well enough established in the soil to stand our winters. If we encourage a vigorous growth late in the fall, the tree does not have time to ripen its wood to the end of the branches, and the tissues are sure to collapse in the late winter.

We find it a benefit to mulch newly planted evergreens, as it keeps the ground from baking and holds the moisture. Give them a heavier mulch in winter and put this on in the fall before the ground freezes

too deep.

If the frost should get below the root line it will be impossible for the root to provide moisture to the needles. When we get our dry winds in March, you will notice that this is the month that our Conifers and Rhededendrons go bad. This is one of the things that we are investigating, to ascertain if we can promote circulation at this time.

Nature provides a mulch of leaves or needles to care for the roots, but we are so sanitary and neat that this covering is not always allowed to accumulate, but must be ralled off and burned, and seldom burned

where the ashes will do good.

In selecting Conifers, the different forms of growth, different lengths of needles, share and size of capes. contrast of shades and color, of old and new growth, wet or dry, if the planting is wind swept or sun shrub, naist all be taken into consideration.

When selecting a place to plant Conifers we must run a light wire around some of the best specimens in winter, so that the snow will not break the branches.

Nearly every large place has one or two corners where a clump of pines or spruces could be planted surrounded by Thorn bush or wild Roses to keep ou: cats. It would encourage birds to build their nests if a few thousand clumps like this could be planted in the two counties, the birds would go a long ways to-

ward controlling the insect pests.

When we have a clump planting that we plant for immediate effect the should give a great deal of thought to the distance we plant apart. We should first plan a planting for permanency a good distance apart, then plant it. Fill with fillers to make a good effect. For this cheaper trees can be used and when they have grown together you take out the fillers. All you who base tried to thin out a planting know that you are compelled to move almost every tree before you are satisfied.

sideration, then give the tree a fair chance and you will be repaid for your trouble. We have now spent time enough on the Conifers collectively; we will endeavor to describe the varieties considered hardy and desirable in our locality.

There is some confusion about the Botanical names, but we crust this will soon be straightened out.

We see hear with the Alies of Pres, and semetices would not the Preus Prist somes Nordina Pres, one of the mandest Proximity and recalled but, seem dock on the upper the add and emath, spleaded contrast netween off and new growth, ultains n Leneraders Loant, hard to treesplant and makes little wrowth to Jun to meet reast; then more recorpast; has a Lore, tap root. Maan times the terminal bud becomes dormant, but after word a constant and makes a new leader. This tree will more a crease hundred feel high and should be given plant, of room to decelop its calcul shape. Now comes the Balsum Fir: its chief recommendation is the odor given off by the needles. Hi short in the trade in charges.

Concolor I'm is a splendid addition to the Firs, a rapid grower and will stand close to the salt water, bears long, blue, flat needles nardy and vigorous. Abies Augonica, Cork Bark Fir, a dense aroung Fre, hardy and a good looking tree. Abies Vobilis, Glanca, should be planted in poor soil.

We will now consider the Picies or Spruces. The white Spruce.

Pien Alba, a handsome tree when young, grows more open as it acts large, bears comes very nound, does well near sult water,

Excelsion, or the good, old Norway Spruce, the true Christmas tree. To one who has lived or traveled in New England this tree ndi appeal to. We can all remember the splendid specimens standent by the white jurn horse, when the snow lay deep on the cround as we harried to school,

We are compelled to admire their vigor, their strength and consume, such and have the north wind with their translable branches havening from their strong arms like limbs. True, then have their own troubles at the present time, but they will get

needle. This tree transplants well, and up to the present Um-Pass to the sult new branches strong enough to stand our high winds; the most some metrical Pine in cultivation. Grows from forty to sixty feet.

Piuns Sylvestris, Scotch Pine, with its hardy, twisted and bending yellow wood of the branches, its many shades of needles, the irregular branches, some georing up and some down; it is so ugls it makes it altractive. It is easy to transplant and bears cones no. a. Greas row party to seem to the leet.

Pinus Magho, Mountain Pine, one of the best and hardiest dwarf evergreens. Effective on banks among rocks on side-hills. When planted in large clumps a few ent-leafed Japan Maples and Magnolia Stellata make a good combination. These trees can be kept at any desired height by carefully pruning, not by taking a pair of box shears and chopping off the ends of the branches. but by reaching up and entting out shoots that are too high. In this wan your plant will grow dense.

The Macho is attached by saughy called a detallater. The larva

of this fly is about twice as large and looks like the currant worm, which will devour all the needles close to the stem. They do their feeding in July. Sometimes they are attacked with cankers on the stem, branches going out, one at a time, until the tree entirely goes. When we find a dead branch we should cut it off and burn it. Dig down at the root, and put in some new soil, and if found dry give a mulch and a good souking. Often when a branch becomes injured a fungus called Phoma Aricola attacks where the branch is injured. These trees will grow to fifteen or twenty feet, with a wide spread, and can be kept down to four feet.

Cembra, or Stone Pine, grows the same shape as a Lombardy Poplar. Good color and hardy. This pine, and some of the other pines as well, become inferted with a scale called Chronaspis Pinifoliae. Under each scale is a mass of reddish eggs which go through the winter on the needles and begin to hatch about the time the new growth starts in the spring. The young crawl about and settle on the newly formed needles from which they suck the sap. After they begin to feed a waxy scale forms over their bodies. If enough of them get on a tree, they will weaken it so that, should we have a long dry spell or a hard winter, it will not have vitality to stand the scale and dry weather.

Pinus Parviflora, Glauca Blue Pine, not long introduced, seems to be very hardy with interesting twisted needles and bears cones young.

Sciadopitys Verticillata, Japan I mbrella Pine, one of the most remarkable forms of growth known. A pyramidial tree, needles in whirls on the ends of the limbs. This is the reason it is called I mbrella Pine. Very hardy and very expensive; more desirable for a single tree than for a clump planting.

The Korensis Densiflora and Red Pine are good for all purposes and of a good color.

The Tanoshia, or Table Pine, bids fair to rival the Mugho. A green, dense grower and very hardy. Good for border and for porch planting; no collection complete without it.

Torrea Nuivefera, Monteray Nut Pine, a splendid tree, hardy with its very broad leaf.

Abies Candensis, native Hemlock. This is one of the best Conifers for all purposes that is in cultivation today. Easy to transplant, will grow in the open or in the shade, graceful in form of growth, looks well planted among rocks, along brooks, among other trees of any kind, and when alone makes a specimen to be proud of. Planted at the edge of a wood with some white and pink dog-wood or shadblow, is attractive. Grows to a great height and can be trimmed to a low hedge.

The Junipers are an interesting and hardy group. We will begin with our native Red Cedar, Juniperus Virginia, often used to get the same effect as the Italian Cyprus in formal gardens. A native of our hill and very hardy, it can be successfully transplanted at most any height, effective among White Birch and Sumac. Is attacked by a small borer that bores into the buds at the ends of the limbs; makes them look brown and dead. One way to control this is to give the tree plenty of water and nourishment, so as to create a good flow of sap. There is a flat-headed borer that attacks weak trees; do not let your trees become weak.

The other Junipers to be recommended are Schotti Japonica Aurea, Swedish and Irish. These should be planted in a protected location in this climate. The trailing of Prostrata varieties, Chinese procumbrence, Sabina, Canadensis, all hardy and very low growing. During dry summers they are attacked by red spiders, which give them a burned appearance.

The American Arbor Vitea is too well known to say much about. It is hardy, useful and ornamental. Good for hedges, grows when planted alone the shape of our native Cedars, a good color. The Siberian is a dense, low-growing, broad, bush-like growth, very hardy. The globe does not grow more than one or two feet. Heavy, very light green, slow grower. George Peabody, grown like the American Arbor Vitea, bright yellow, all free from pests.

The Cedrus Atlantica Glauca, an attractive tree but in color, irregular in form of growth, needles short, much admired and one of the hardiest trees we have.

Now comes the Retinospora; this type of evergreen is attractive, especially while young; bears shearing to keep them to the desired height. Have not been introduced long enough to say how they will look at from one to two hundred years from now.

The Plumosa, green and yellow, are hardy, lift good and stand transplanting well; grows to a good sized tree with care.

The Pissifera, a green and yellow, and Fillifera, green and yellow, are hardy and grow to a good height. The Obtusa, green and yellow, are dwarf, good for garden borders or for pots.

The Spuarossa, when growing well, is most admired of the Retinosporas, but in the spring or planted too close to other trees looks rather sad.

The Biota, or Chinese Arbor Vitca, we cannot leave out, though not the hardiest we have in cultivation. Their dense, knife-like

foliage in various shades of green, with their different shape buds, make them attractive and useful. The Biota Elegantissima, when it starts to grow in the spring, is a light golden green, changing from month to month until in winter it turns to a beautiful bronze.

All the trees named in this paper are hardy under most all conditions. Evergreens cannot stand extremely wet locations. Keep the ground stirred around your trees; if they require water give it to them; if planted in a bleak, wind-swept place, protect for two or three winters, until they get a good root growth.

Do not get provoked at a tree because it may look sick, the chances are that it has been neglected.

## A DOG FANCIER AND HORTICULTURIST.

Judge J. Bayard Kirkpatrick, owner of the famous Closburn Farm and Kennels, at West Caldwell, N. J., is a great fancier of the Scottish Deer Hounds. He is seen in the accompanying illustration standing in the ring, at one of the recent dog shows, waiting to have his famous stud dog, "Roderick of Closburn," judged.

Judge Kirkpatrick has imported a great many Scottish Deer Hounds and is greatly interested in their breeding and training. This is purely a pleasure with him and he regards these dogs as the most affectionate animals in dogdom. At the Westminister Kennel Club Show at Madison Square Garden, New York, this year one of the features were the famous Scottish Deer Hounds exhibited from the Closburn Kennels.

While a great dog fancier, Judge Kirkpatrick is also an enthusiastic horticulturist and is at the present time developing his estate at West Caldwell. On it are to be found some of the most modern farm buildings in this section of the country. The construction of a sunken garden is now contemplated, which, when completed, is expected to be one of the most attractive in the state of New Jersey.

CHAMPION RODURICK OF CLOSHRURY, WINNING HIS FIRST AMERICAN CHAMPIONSHIP, WITH HIS JUDGE.

### THE HISTORY OF THE KEW ROCK GARDEN.

Although the rock garden at Kew, so long the delight of Londoners, was constructed in its present shape more than thirty years ago, only during the last winter was it completed according to Sir Joseph Hooker's original plan. Sir Joseph Hooker was not only a great botanist, but was also widely famed for his artistic skill. His sketches made in the Himalayas during his classical journeys in India have been the admiration of all subsequent students of botanical painting. When, therefore, he succeeded his father, Sir William, as second director of the royal botanical gardens, the supervision of the artistic development of the grounds was one of his chief delights. And when a collection of two and a half thousand alpine plants was presented to the establishment by one Joad of Wimbledon in 1882, and it became immediately necessary to construct a large rock garden to receive them, the planning of this new feature was a work entirely after the heart of Sir Joseph and he set to work upon it with his accustomed energy and enthusiasm. He took as his model not any artificial rock garden that he knew, but his recollection of the shape and summer garb of some well loved and well known alpine valley in the Pyrenees, where the winter torrent has given place to a shallow watercourse and the banks of a succession of tiny precipices and bays all richly decked with the floral gems that are characteristic of those mountains.

The stream was represented by a flat winding pathway, the banks by rocks of various kinds, arranged in bold masses, leaving between them sheltered nooks and miniature side valleys. Broader bays were made to accommodate marshes and other special features for flowers of fastidious tastes. In one place a small cascade falls from the upper rocks and gives rise to a little stream, which wanders through the meadow at its foot. The flowers of this meadow are chosen from the meadows of our temperate regions and require the damp soil of their natural habitats. To maintain the water level near enough to the plant roots the whole soil of the bay is enclosed underneath and at the sides with an impervious clay lining, and how satisfactorily this does its duty can be seen from the luxuriance of the meadow vegetation.

The actual rock work is made of large blocks of various kinds of stone so arranged as to give the impression of stratified rocks weathered by natural agencies. Three English localities famous for their wild flowers were drawn upon for the stone. The neighborhood of Bath furnished oolite, a rough granular rock easily accommodated to the uses of rockeries. Water-worn limestone blocks were imported from Cheddar cliffs, a famous rocky glen in the Mendip hills and the home of the Cheddar pink and many other rare and beautiful flowers. While for the saxifrage collection was obtained a quantity of tufa from Darley dale in the Peak district of Derbyshire.

But the rocks originally provided were not sufficient to build up the 300 yards or so of banks for more than two-thirds of their length and the remainder had to be made of earth heaped over large tree stumps to consolidate the whole. These stumps, though a makeshift, have made a fine humus for the generations of valuable plants that have decked this end of the rock garden. But the general effect of the rockery was marred by their use and the uniformity now obtained by the substitution of rocks in their place completes the beautiful scheme intended by Sir Joseph Hooker.

—Christian Science Monitor.

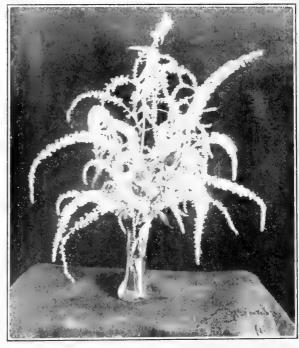

### RED-STEMMED DOGWOOD.

Those who have the planting of grounds are often called on to set out shrubs or trees which in some way or other will present something pleasing to behold in winter, writes Jos. Meehan in Florists' Exchange. In evergreens it may be foliage; in trees, some peculiarity of color in the bark, or those of a weeping character; in shrubs, it is chiefly in the color of the bark. We would mention now as one of the best of shrubs for colored bark the red-stemmed Dogwood, Cornus stolonifera. sometimes called C. alba, a native shrub, though a European one, more often called C. alba, is of much the same character, while by some considered superior to our native sort. But treating both as one, they may be considered as a small shrub, well suited for planting in groups for color effect in winter, and often so planted. Corresponding in character with many other shrubs and trees, such as some of the Willows, the color of the bark of this red-stemmed Dogwood is at its best in winter. As soon as the leaves are shed and cold sets in, the red color is apparent, and it heightens as the winter advances. When spring commences the red vanishes, and the usual green of summer starts in.

The best way to insure a mass of color is to prune the bushes severely in spring, which will give numerous strong shoots by fall.

## THE WHITE BUDDLEIA.

Buddleia, as a genus of almost hardy shrubs, furnishes three very distinct species for garden decoration. These are B. globosa, with round, ball-like, orange colored blooms; B. variabilis, with purplishheliotrope elongated spikes; and thirdly, the one here illustrated, B. asiatica, with (nearly) white spikes.

BUDDLEIA ASIATICA—RECENTLY INTRODUCED GREENHOUSE SHRUB THAT GROWS MANY FEET IN A SEASON AND FLOWERS IN WINTER.

Buddleia asiatica came into our greenhouses from the wilds of western China a few years ago and has soon become a favorite. As a climber for the conservatory or greenhouse, either in a large pot or tub, or planted out in a border—which is best; and trained to a pillar, or upon wires under the roof, it is a commendable plant.

## Miniature Gardens for Decorations

Many prominent florists in New York and other cities are displaying miniature Japanese gardens, and bowl gardens in their windows, and they appear not

IRIS BOWL GARDEN

only to attract passersby to the windows, but to sell quite freely. Both children and grown-ups are interested in them, and they are used very largely in table decorations.

One possessing an ordinary decorative taste may, with the large assortment of auxiliaries available make up some pleasing garden combinations, and enjoy the work. Either water or dry landscape effects are possible, and the gardens maintain

few days growth is produced and the pieces may be used to represent islands, peninsulars and other foundations, upon which such figures as pagodas, shrines, bridges, birds and the like may be disposed in a picturesque way. When a grass effect is desired, grass seed may be used in connection with the Horse Radish. Another quick effect is obtained through the use of Carrot tops. A handsome bow1 effect was seen recently in which a

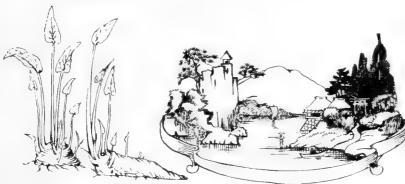

MINIATURE TRAY GARDIN

Carrot top had been used, and very many who saw it could not recognize the vegetable source.

We present in our illustrations some simple designs easily worked out. The various accessories used are supplied in sizes to insure a correct perspective relation to the scenes arranged, and the subjects are almost innumerable.

The bowls are generally used for sprays or single flower effects, and are very useful for an inexpensive display. Various forms of flower holders of glass or earthenware are used to hold the flowers in a dish, the holders in crab, frog, duck and other designs.

a fresh appearance for sometime.

Besides the various accessories to be obtained from the importer, there is much material to be found at home, and it may be used to advantage. For instance, ordinary garden Horse Radish may be cut in pieces of a size required, put in water, and in the course of a

MINIATURE GARDEN ACCESSORIES.

# Vegetables and Flowers from the Cold Frames

By Duncan McIntyre, New York.

To the enthusiastic amateur gardener nothing gives more pleasure than the growing of plants and vegetables in hotbeds or coldframes.

In England I have seen very excellent specimens of flowering plants grown for exhibition in deep coldframes by amateurs and apart from the pleasure side of using coldframes for plant growing, they are also profitable to amateurs in forwarding vegetables to lengthen their season of growth for exhibition purposes, and for the raising of annual flowering plants.

To the professional private gardener, coldframes

and hotbeds are indispensible.

Hotbeds may be made either above ground or below ground, but I prefer for early growing a pit about handle will produce heads for cutting by May 1, and I find the varieties Hittingers Belmont and Commodore Nutt, with May King for succession, to be excellent varieties for this purpose.

Cauliflower is another vegetable very much appreciated when home grown early in spring and no vegetable responds as readily to good culture under glass. Sow seeds thinly about the end of January, and grow along without a check for to cut nice heads about April 15 to May 1. The varieties First Crop and Purity are the best I know of for hotbed culture, with Snowball for succession.

Carrots are another vegetable which responds to hotbed culture, if forcing varieties such as Early Short

> Horn and Paris Forcing are used, and are much valued in spring. Sow in lines about six inches apart, and if sown thinly, this crop needs no thinning until the carrots are large enough to

> Beet tops are a good substitute for spinach in early spring, and by sowing seed about March 1 in six weeks they are ready to use; sow the seed as directed for carrots.

> Radishes may be sown at intervals and if space is limited this crop may be sown between the lines of transplanted lettuce, and used before the lettuce comes to maturity.

Cabbage is a vegetable not often given space in the hotbed, but where quantities and a variety of vege-tables is needed in April

grown successfully by sowing and transplanting as directed for cauliflower. The varieties Imperial and

AN GO INTO THIS TRAME MATTER IN EARNEST AND USE THEM JUST LIKE YOU WOULD A GREENHOUSE TO GROW ALL KINDS OF OUT OF SCASON A EGETABLES AND FLOWERS

four feet deep with concrete sides and bottoms, and provided with bottom drains, with provisions for sash

Material for making hotbeds are generally plentiful on private estates, dry leaves and horse stable manure in equal parts is all that is needed, and turned every three or four days to prevent too rapid fermentation and to thoroughly mix. After turning several times and the excess of ammonia has escaped it is ready to put in the frame, when the material should be well tramped down to prevent the loss of heat too rapidly.

Generally after placing the material in the frames, it becomes quite hot, but a thermometer placed in the

material serves as a guide.

When the material shows a temperature of 90 degrees to 95 degrees put about six inches of soil on top and rake finely on top, and close the frames for the whole to settle.

In a day or two the soil will be warm and ready for

seed sowing.

Lettuce is one of the most looked for early articles of diet from the garden, and by sowing seed about the middle of February on a warm hotbed prepared as described and transplanted when large enough to

THE SOUTH SIDE OF A BOARD FENCE IS AN IDEAL PLACE FOR TOMATOES.

Early Market are the best varieties for this purpose. Apart from the growing of vegetables to maturity many seeds of vegetables which need a long season of growth to perfect may be forwarded by means of

the hotbed.

Onions and leeks are two of the most important; sow the seeds of these in flats and transplant to other flats and grow along, giving ventilation whenever possible until about April 15, when they may be transplanted to the open ground.

Tomatoes, celery and eggplant may be located in the

same manner.

Flowers also are needed for early cutting from the garden, many of these may be started in the hotbed, and when weather conditions allow may be transferred to the coldframes and from there to the open ground.

Asters, salpiglossis and antirrhium are among the most suitable for this purpose, although others do equally well treated in the same manner, according to

requirements.

Hotbeds are more essential to the professional gardener than the amateur, the latter can wait the developments of the season, but it is the duty of the professional gardener to provide as early in the season as

FOR DAFFODH'S OR NARCISSUS, TRY SOME OF THESE LITTLE PLANT FRAMES OVER THEM AND FORCE THEM IN BLOOM TWO WEEKS AHEAD OF THE USUAL TIME.

possible what vegetables and salads he can. He is not supplying food for remote families of whom he knows nothing, but for one particular family with whom his

destinies are closely bound up. So from the little extra work caused and the good results produced it is worth a trial on all estates which have the material for hotbed making at their disposal, and nothing is more appreciated in early spring by all private families than vegetables and salads grown in their own gardens.

Perhaps there is some little confusion in the terms "cold frames" and "hot beds." Cold frames are those warmed by the sun only; hot beds by an under bed of manure giving heat by its fermentation. They are both a sort of small greenhouse that will yield bountiful returns every month in the year. Don't hold the idea of their being limited to growing lettuce, radishes or getting a month or so's start of your neighbor, for these are a small. very small phase of their possibilities. Every grower has particular views on soils, fertilizers, propagating and growing, views that are the results of experience. So there is no use trying to give

IN NEWPORT, R. I. THE WINTERS ARE LONG AND THE SPRINGS LATE. WITHOUT A GREENHOUSE OR COLD FRAMES THE GARDENS ARE APT TO BE VERY LATE. THIS VIEW SHOWS A GLIMPSE OF A GARDEN WITH MELON BOXES IN USE.

hard and fast rules for managing frames any more than for other plantings.

Ventilation is a phase of the hot bed or cold frame growing that should receive serious attention. Too much of it will chill your plants. Too little of it will make them soft. In cold weather, raise the sash slightly during mid-day while the sun is out. In warmer weather the sash can be elevated or slid down from the frame. Dur-

ing extreme cold weather the frames require some protection by covering of mats to go over the glass.

Illustrations by Lord & Burnham Co.

THESE FRAMES ARE ALL DEVOTED TO VIOLETS AND THE FAMILY IS NEVER WITHOUT THEM FROM OCTOBER TO APRIL. THE POSITION OF THESE FRAMES, EACING SOLITH, WITH A PROTECTING FENCE AND SHRUBBERY AT THE NORTH, IS EXCELLENT.

## GARDEN CLUB DAY AT THE FLOWER SHOW.

The committee in charge of the New York Spring Flower Show has set Friday, March 19, as Garden Club day. This day was a popular one at the show last year and the year previous. Several large delegations of garden club members came from neighboring cities and not a few of them came from distant points. Some of the out of town clubs have already signified their intention of having their members gather at the show on Garden Club Day and everything indicates that the garden clubs will take even a greater interest in the 1915 show than they did in the previous years' shows.

## ORCHID CULTURE IS NO MAGIC ART.

(Continued from page 119.)

Dendrobium Jamesianum is another evergreen which likes a little shade and the cool end of a house and plenty of water.

Odontoglossums are a noble race of cool house or-

chids that succeed better in England than in our climate with the exception of several beautiful forms, namely, O. grande (Baby Orchid) and O. Insleayi, both magnificent large flowers.

Calanthes are another type of orchid that can be grown in a cucumber or palm house in summer, though a little different culture, than before described is necessary. Procure bulbs of last season's growth, stand them perpendicular in a flat with leaf mold or peat dust until roots form. Then pot into 5-inch pots, half full of crocks for drainage, in a mixture of coarse loam three parts, one part peat and one part sand or charcoal dust. Give plenty of water during growth, also shade. When the bulb is completed give it absolute rest, when, being deciduous, it casts its leaves and its beautiful flower spikes appear. Then commence to water again.

Much more could be written about these beautiful plants, but my notes are simply based on an ordinary place where a mixed collection of plants are grown and where no specialist or special houses are employed.

One of the important points to bear in mind is to adhere to the dry side generally, for orchids will invariably succeed better than when saturated continually. Sprinkle a little soot and lime around occasionally, being careful when in bloom; it being advisable to place the ones in flower in a part of the bench by themselves.

### OH. EVER'THING'S A-GOIN'.

When ever'thing's a-goin' like she's got a-goin', now— The maple sap a-drippin', and the buds on ever' bough A-sort o' reachin' up'ards all a-trimblin,' ever' one, Like 'bout a million brownie fists a-shakin' at the sun, The children want their shoes off 'fore their breakfast, and the spring

Is here so good and plenty that the old hen has to sing! When things is goin' this a-way, w'y, that's the sign, vou know,

That ever'thing's a-goin' like we like to see her go!

Oh, ever'thing's a-goin' like we like to see her go! Old winter's up and dusted, with his dratted frost and snow.

The ice is out o' the crick ag'in, the freeze is out the ground,

And you'll see faces thawin', too, ef you'll jes' look around-

The bluebird landin' home ag'in, and glad to git the chance,

'Cause here's where he belongs at; that's a settled circumstance.

And him and Mr. Robin now's a-chunin' fer the show. Oh, ever'thing's a-goin' like we like to see her go!

The sun ain't jes' p'tendin' now—the ba'm is in the breeze-

The trees 'll soon be green as grass, and grass as green as trees.

The buds is all jes' eechin', and the dogwood down the

Is bound to bust out laughin' 'fore another week is done.

The bees is wakin', gapy-like, and rumblin' fer their buzz,

A-thinkin', ever wakefuler, of other days that wuz— When all the land was orchard blooms and clover, don't you know.

Oh, ever'thing's a-going like we like to see her go! -James Whitcomb Riley. JOHN W. EVERITT, President, Glen Cove, N. Y.

M. C. EBEL, Secretary, Madison, N. J.

### ASSOCIATION NOTES.

An executive meeting of the trustees and directors of the association will be held in New York City on Friday, March 19. Arrangements for the summer meeting to be held in San Francisco, Cal., in August next will be consummated.

A meeting of the Essay Committee will be held in New York during the flower show to complete the details of President Everitt's prize article competition, for which he has offered \$100 in gold. Owing to the distance apart that the members of the committee live from each other, it has been impossible so far to come together.

The Co-operative Committee will report the results of its efforts to establish an educational course for the benefit of the members of the association at the meeting of the Executive Board. It will also report on several other plans to promote greater co-operation between the national and local societies.

From time to time reports appear in the daily press and in other publications of intemperate utterances made against the gardening profession or of those who follow its calling. In order to refute misstatements or reflections appearing against the profession, the Co-operative Committee requests that whenever anything is published detrimental to the profession the observer mail a marked copy of the publication in which it appears to the secretary, so that the gardeners' interests may be properly defended through their national association against unjustified published criticisms.

The American Association of Park Superintendents has extended an invitation to the gardeners' national association to have it join the park superintendents in their trip to San Francisco. It is planned to leave New York August 5, stopping a day at Chicago, a day at Minneapolis, a day at Glacier Park (Montana), one day each at Spokane, Tacoma, Seattle and Portland, arriving at San Francisco on August 16; leaving on the 22d for Los Angeles and San Diego and leaving there on the 26th for a day's stop over at Salt Lake City, Colorado Springs and St. Louis, and return to New York on September 5. Railroad fare, including Pullman berth, will be approximately \$155. At the different cities visited the Park Boards will entertain the party so that it may be relied on that the sight seeing arrangements at the different stop overs will be of the best. Fuller details of the trip will be published in the next issue.

An invitation has been received from the Menlo Park Horticultural Society, California, to have the gardeners attending the summer meeting set a day aside to visit Menlo Park in a body as the guests of the local society. At the last meeting of that society the secretary was instructed to get in touch with the officials of the N.A.G. to learn how many members will make the trip, so that proper arrangements can be made to tender the Eastern brothers a royal good time.

Lans P. Janson, St. Louis, Mo., chairman of the Committee on the Preservation of the Native Birds, trusts to have a report to submit shortly on the work planned by his committee and which should be of interest to every member of the association.

## AMONG THE GARDENERS

Frank C. Drews recently resigned his position as superintendent of the Essex County Country Club, Orange, N. J., to accept a position of superintendent on the estate of Charles R. Huntley, Lancaster, N. Y. Mr. Drews assumed his new duties on the first of the month.

J. Knight succeeds R. Stobo, who recently resigned his position as superintendent of the H. L. Hoyt estate, Great Neck, N. Y.

William Brown, until recently gardener on the John D. Rockefeller estate, Pocantico Hills, N. Y., has accepted a position as superintendent on the estate of C. W. McAlpin, Morris Plains, N. I.

George McKenna, formerly superintendent on the J. J. Day estate, Summit, N. J., sailed on March 1 for Havana, Cuba, to accept the superintendency of a plantation on that island.

N. Ireland has accepted the position of superintendent on the H. R. Winthrop estate, Woodbury, L. I.

Theodore J. Schmid has resigned his position as superintendent on the Charles A. Otis estate, near Cleveland, Ohio, where he was in charge for a number of years, to engage in landscape gardening on his own account. He has opened offices in the above named city and in Willoughby, Ohio.

John B. Sullivan, gardener for Charles F. Hoffman, Newport, R. L., was recently appointed postmaster of that city. Mr. Sullivan has been active in politics for a number of years and has for some time been a member of the State legislature.

Samuel Matson has accepted the position of head gardener on the estate of Mrs. Alexander S. Clark, Newport, R. I.

Charles D. Stark recently resigned his position as gardener to T. Suffern Tailor, Newport, R. I., after being in charge of the estate for nearly twenty-eight years.

William N. Craig, of Brookline, Mass., delivered a lecture before the Rhode Island Horticultural Society in the Public Library, Providence, R. I., recently, his subject being "The Home Vegetable Garden"

James Scott, who has been superintendent on the estate of Mrs. Charles T. Hayden, Magnolia, Mass., for a quarter of a century, has resigned that position to accept a similar one on the estate of Mrs. C. A. Sinclair, West Gloncester, Mass.

Walter Boggis, for the past three years engaged in the gardening department on the Twombly estate, Madison, N. J., under Robert Tyson, superintendent, has secured the position of head gardener on the estate of Paul Moore, Convent, N. J., succeeding Edward Davies.

Duncan MacIntyre, also of the gardening department of the Twombly estate, Madison, N. J., has accepted the position of super-intendent on the Ernest Iselin estate, New Rochelle, N. Y.

## Of Interest to Estate Owners

The National Association of Gardeners maintains a Service Bureau which is at the disposal of all who may require the services of efficient surdeners in their various capacities.

The association seeks the co-operation of estate owners in its efforts to \*secure opportunities for those engaged in the profession of gardening who are seeking to advance themselves. It makes no charge for services rendered. It endeavors to supply men qualified to assume the responsibilities the position may call for.

Make your requirements known to

M. C. EBEL, Sec'y, National Association of Gardeners, Madison, N. J.

G. X. AMRHYN, Pres., New Haven, Conn.

R. W. COTTERILL, Sec.-Treas., Seattle, Washington.

### ASSOCIATION NOTES.

A conference to discuss the 1915 convention plans was called by President Amryhn at New York City, the meeting being held at the office of Park Commissioner Cabot Ward on Saturday, February 20, with the following present:

Amrylin, of New Haven; Fred C. Green, of Provi-Gustave X. dence; James Shea and Wm. J. Stewart, of Boston; Wm. H. Coldwell and Chas, Haible, of Newburgh; M. C. Ebel, of Madison, and Hermann W. Merkel, George V. Nash, Wm. J. Zartman, Frank L. Hamilton, John F. Walsh, John H. Beatty, Edward A. Miller, Wm. C. Grassau and G. H. Burgevin, of New York.

As but three members of the Executive Board were present, the conference was informal, but its action will probably be confirmed by the other members of the board,

After a full discussion regarding plans for the August convention at San Francisco, the following was agreed upon:

That it was advisable that our convention be held the same week as the convention of the Society of American Florists, which has fixed its dates as August 17 to 20.

That a full one-day business session be held on Wednesday. August 18, with morning, afternoon and evening business sessions. The Executive Board can hold its meeting the evening before and any programme of tours of inspection or social features to follow on the 19th and 20th

That an effort be made to have delegates to the convention travel together by special cars or train, and an itinerary submitted by M. C. Ebel was approved.

This itinerary calls for a general assembling at Chicago on August 7, then proceeding by special cars or train via the Northern route and Pacific Northwest with stop overs as follows: One day and evening at Minneapolis; an afternoon at Glacier Park; a day and evening at Spokane; a day and evening at Seattle, and a side trip to Tacoma; a day at Portland, arriving at San Francisco on the evening of the 16th; leaving San Francisco on the 22d for Los Angeles, where San Diego is a short side trip.

The return route to be via Salt Lake City, Colorado Springs, Denver, St. Louis, etc. The return trip will most likely be made in groups, but it is hoped that the westward trip can be as a special party.

Full details of itinerary will be sent to all members by the secretary at a later date.

The cost of proposed itinerary, transportation and sleeper charges from New York will be approximately \$155. The Park Boards of stop over cities will entertain the party to advantage.

Mr. Coldwell, of the Coldwell Lawn Mower Company, invited the association to make their building on the Exposition grounds its headquarters, which offer was accepted.

## PARK DEPARTMENT PERSONALS

Our fellow member, Richard Power, of Halifax, N. S., recently completed forty-three years of service in charge of the Public Cardens of Halifax, and the following extract from a Halifax paper best describes a most unusual ceremony in connection therewith:

"Superintendent Power, of the Public Gardens, was presented with a substantial check and illuminated address in the City Council Chamber Wednesday by Mayor Bligh on behalf of the citizens of Halifax. Many prominent people of the city were

present to felicitate Mr. Power on this happy occasion.
"In making the presentation, Mayor Bligh said that the Public Gardens were famous all over America. He called on Mr. W. E. Schwartz, chairman of the fund; the Lieutenant-Governor, Archdeacon Armitage and Dr. Forrest. They all spoke in the highest terms of the Public Gardens and of Mr. Power.

"In a few brief words Superintendent Power thanked the executive and the people of Halifax for the honor conferred on him. He said that it was gratifying to know that his efforts to please the people had met with success. Mr. Power said it had always been a pleasure to him to beautify the Gardens. Closing, he said: 'I thank you all and wish you the season's greetings.'

The amount of the check was \$1,281.17.

The illuminated address was as follows:

To Richard Power, Esquire.

Sir: A number of citizens of Halifax and a few other friends take this opportunity of expressing their appreciation of the great work you have accomplished as superintendent of our Public Gardens.

You have been in charge almost from the beginning, and we can offer no higher praise than simply to point to the marvelous beauty of this far-famed spot. We believe that you may justly and without boasting say like the great architect of St. Paul's Cathedral: "Si monumentum requiris circumspice."

The name of the Halifax Gardens has gone far and wide. We hear of them everywhere. Nothing more beautiful can be found in any city in America. However faithfully the commissioners may have done their work, they would be the first to acknowledge that the credit of their great success is justly due to you. When we remember the limited resources that have been at your command every one is amazed at the work that has been accomplished.

Your unfailing kindness and thoughtful consideration have added greatly to the pleasure of all visiting this beautiful spot, and have made you beloved by old and young alike.

Please accept this accompanying gift as a small token of our

We pray that your life may long be spared, and we feel that while you live the Halifax Public Gardens will maintain the position they have so long held among the beautiful public places on the continent.

Through a bequest in the will of Collis P. Huntington, the city of San Francisco is to secure for use as a children's playground a tract of ground in the fashionable Nob Hill district, valued at \$275,000,

Nicholas Byhower, who will be remembered by those who were at the Kansas City convention on account of the beautiful photographic display of Salt Lake City which he exhibited, has retired as superintendent of the parks of that city. Mr. Byhower owned an interest in a nursery, and when the park department secured some stock from this nursery, political enemies got in their work and brought about his retirement.

This is a striking illustration of how a man's motives may be misjudged. Mr. Byhower had built up the Salt Lake City park system from its infancy, and it is unfortunate that he should be the victim of political enemies.

The 45th Annual Report of the West Chicago Park Commissioners just out is the most attractive publication ever published by any of the park administration agencies of that city.

In addition to a wealth of pictures illustrating buildings equipment and development work, Superintendent A. C. Schrader has devoted thirteen pages to a detailed report on the playground facilities, plan of operation, activities conducted, employees and general descriptive detail, which should prove invaluable to other cities wrestling with this problem.

A review of this kind unfortunately seldom appears, and if you missed it, better look it up. Superintendent Schrader is to be congratulated on having incorporated in his report such valuable detail.

### RECOMMENDATIONS FOR LOUISVILLE'S PARKS.

John C. Olmstead, of Brookline, Mass., landscape artist for the Louisville Board of Park Commissioners, was recently in the city, where he made a ctudy of the parks and parkways, after which he made a report to the board. Mr. Olmstead called particular attention to the necessity of planting trees. Other recommendations were that Louisville should have a city planning commission; that park scenery should not be marred by erection of public buildings in parks; that playgrounds should not be permitted in parks, unless screened by shrubbery to prevent marring of the park's beauty; that the number of the parks should be added to, as they would soon be inadequate in size for the city: that the parkway system, which is inadequate because of the method of financing, should be paid for by the assessment system prevailing in Kansas City; that there should be radial parkways from the center of the city, some streets being beautified as parkways as much as possible, and that Third street and Broadway should be made parkways under the control of the park commissioners, with building restrictions along all new parkways. The routes along all interurban lines should be beautified, he said, and a number of extra playgrounds should he' supplied in various parts of the city, these playgrounds to be beautified to some extent by shrubbery. It is not known at this time what action the park commissioners will take concerning the recommendations of Mr. Olmstead.—Exchange.

## The San Diego, California Exposition

Three years ago, in the heart of the city of San Diego, Cal., there was a fourteen hundred acre tract of land on which there was not a single building. Neither was there much in the way of foliage. For longer than the memory of man that tract of land had been untouched by water, except by the rare rainfalls which strike the city. As a result, the adobe soil was packed hard and seared by the almost constant sun. In the canyons and on the mesa there grew nothing save cactus and sagebrush and chapparal. On one side of

the mesa was a scattered grove of pepper trees, battling desperately for life without any assis-

tance in the way of water.

That was three years ago. Today on that mesa stands a gorgeous city of old Spain, and the land about the buildings, even down to the depths of the canyons, is covered with a thick growth of semi-tropical foliage, with lofty trees and spreading shrubs and low bushes, through whose deep green flashes the crimson of poinsettia, and the tecoma, and the bright gold of the California poppy. The magic garden has taken the place of the desert. He who saw the land three years ago and sees it again today, would think that some modern Aladdin had come this way and rubbed his lamp; but the only wand which the magician of San Diego used is known more commonly as a spade, or a trowel, or a garden hose.

The effect, however, is as tremendous as the

Island, and to the rugged outline of Point Loma with the bristling guns at Fort Rosecrans. Along the outline of the Coronado Islands, and about them, and thousands of miles beyond, stretches the silvery surface of the Pacific. Over the other parapet of the bridge, and beyond the canyon as it winds its way through fertile valleys of olive and orange and grape.

canyon, over the roofs of the city of San Diego, into the Harbor of the Sun, and across to the strand of

Coronado to the marine and aviation camps on North

IN THE BOTANICAL BUILDING A TROPICAL LASSINITA

IN THE BOTANICAL GARDEN LOOKING ACROSS THE LAGUNITA.

effect of old-time sorcery. Across the deepest parts of the Canyon Cabrillo, the engineers threw a majestic quarter-mile bridge of seven arches, the piers rising from the depths of a laguna in the canyon one hundred and thirty-five feet below. It is over this mighty viaduct, the Puenta Cabrillo, that a great part of the visitors to San Diego's 1915 Exposition march on their way to the sights within the old stone gate by La Puerta del Oeste.

From that viaduct, a most commanding view is seen. Over the side parapet, one looks down the winding like the foothills of the snow-capped Sierras, and to the table lands of old Mexico.

Below, is the floral work which man, working hand in hand with a most beneficent nature, has placed in the spot that was once a desert. Along the edge of the Puente stands a grove of Italian and Monterey cypress, the slim outlines of the trees accentuating the height of the bridge itself. Beyond this is a great patch of acacia of different kinds, varying all the way from darker greens to the green that is almost steel gray of the acacia and bailyana. Beyond the acacia are a few of the two hundred varieties of eucalyptus, the blue gum and the red gum and the ficifolia with its blaze of brilliant red.

Then come the palms—tall ones of the cocos pluosa variety, the thick-bodied phoenix, and the graceful swainsonia, and a score of others. There is a succession of other trees with bright blooming flowers scattered among them. Along

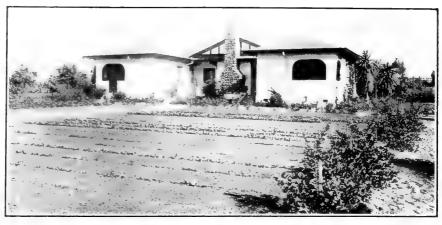

the main bridge from the West gate are copse of abelia and fuchsia, of canna and escallonia, grevillea and leptospermum; the bright orange of the lantana gleams through the hedges. These are the plants which are used extensively for broad display features.

Within the grounds an entirely new array appears. Along the Prado, lined with its double row of black acacia and the thick green lawn, stretches a hedge of coprosma with its waxy green leaves interspersed with the triumphant crimson of the poinsettia.

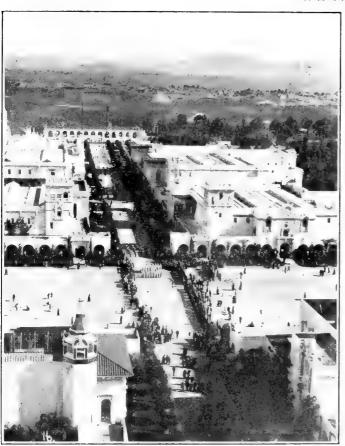

The most extraordinary floral work on the grounds, however, is that which is to be found in the Botanical

Photos copyrighted by Panama California Exposition,

Building, and the gardens which surround it. Flanked by the quiet pool, La Laguna de las Flores, these gardens occupy the entire space between the Prado and the defile which leads into the Canvon Cabrillo and the north and south space between the Cafe Cristobal and the Home Economy Building. Within the Botanical Building itself, one of the largest lath-covered structures in existence, is a rare collection of semi-tropical and tropical plants. The building is thick with palm and bamboo, and aralia, a sort of little brother to the fig tree, and banana and its relatives, and many other forms found generally in Central American jungles. The ground covering is almost en-

A MODEL INTENSIVE FARM WITH A CALIFORNIA BUNGALOW.

FOOKING LASTWARD IN FL PRADO FROM THE TOWER OF CALIFORNIA BUILDING

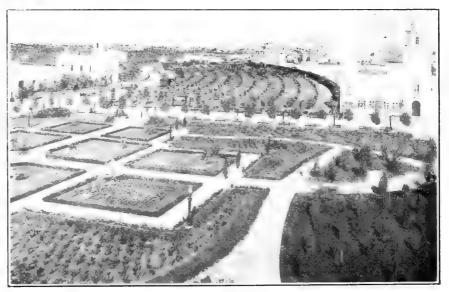

tirely isolepsis. There are two great cages from which come all day long the songs of the thrush and linnet and canary.

There is an open pool thick with lilies, almost into which falls from the ceiling the growth of vitis, one of the air plants and the sweeping fronds of tropical ferns planted along the edge. There are also the tree fern, the insectivorous pitcher plant, and other rare contributions from the tropics, but far more impressive than these strangers, is the sight of the trees and shrubs which are occasionally found in Northern conservatories, where they reach a moderate growth. In San Diego they grow out-of-doors in their natural state, and reach a height and splendor which is impossible indoors. This is particularly noticeable in Japanese cedar, wistaria and other visitors from the Orient, which fill the Japanese gardens at the rear of the main Botanical Gardens, half-concealing the pavilion which Japan and Formosa have erected as an Exposition exhibit.

Across the Alameda lies the citrus orchard of orange and lemon and grape fruit and tangerine and kumquat, and a number of interesting hybrids of various citrus grafts, all blooming and bearing in their natural surroundings. The sight of the fig and date, the apricot and olive and alligator pear is afforded the visitor of the north throughout the year in the model farm by the citrus orchard.

Further down is the tea plantation brought over from Ceylon by Sir Thomas Lipton, where some two hundred young tea saplings are growing and bearing and furnishing commercial tea leaves for serving in the pavilion at the center. Of course, the cactus of the desert country is shown, and over the view of the distant hillsides, still lies the great mantle of the sagebrush and the chapparal. In other words, everything which is natural to southern California, and which once transplanted, grows as well as if it were a native, is to be found within the Exposition gates. It is the most complete horticultural display that America has ever seen.

THE GARDENERS' CHRONICLE is a journal of useful technical knowledge for the advanced amateur. Subscription, One Dollar a Year.

# The Linking of the Minneapolis Park Lakes

By Theodore Wirth, Minnesota.

Minneapolis is the fortunate possessor of a chain of lakes within and adjacent to the city limits. They form an important part of its extensive park system and, naturally, are the main attraction of several beautiful residential districts of the city.

Minneapolis is one of the many progressive and flourishing cities of the great Western country, and although only a little over 60 years old it has a population of about 350,000, within a city area of 53 square miles. The present extensive and comprehensive system of parks and boulevards, encircling the entire city in an uninterrupted belt of parklands 35 miles in length, is the result of the foresight, untiring efforts and labor of the Board of Park Commissioners, now entering on its 33rd year. Wise foresight and courageous confidence in the future certainly guided those men in the days of an ambitious beginning. Most of these now much coveted lake possessions were far out in the country, when they were acquired, and considerable opposition was encountered to the so-called "foolish swamp acquisitions."

The following lake areas are now included in the park

system:

Acres.	
Lake Calhoun	
Lake Harriet	
Lake Nokomis 295	
Lake of the Isles 107	
Glenwood Lake	
Powderhorn Lake	
Brownie Lake	
Loring Lake	
Birch Pond 6.5	
Spring Lake	
Total	

Of the chain of lakes along the western side of the city, four of the seven were of practically the same eleva-

tion and were separated only by low swamp lands of from 400 feet to 2,200 feet in width. The only connections between those sheets of water were open ditches and a few culverts laid under road beds and railroad embankments constructed across the swamps. Some of those lakes were completely surrounded by swamps and nearly inaccessible. Most of them offered plenty of deep water, but had in part shallow, swampy shores. The lakes are fed by springs and small streams, and some are 100 feet deep in places.

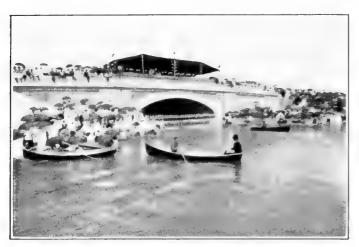

The improving of the lake parks and the construction of proper waterway connections between the lakes was the ambition of the Board of Park Commissioners, and the people of the city, for years before it became possible to undertake the work. It was not simply a matter of excavating channels and lagoons, but required the additional acquisition of expensive lands occupied by icehouses and other buildings, the building of railroad, traffic road and boulevard bridges, and the necessary approaches; in short, the entire scheme of connecting the lakes and improving the shore lands and boulevards called for a very large investment for which it was difficult to secure the necessary funds. In the meantime the large tracts of private lands adjacent to these unimproved park properties, while offering splendid and attractive building sites for residences, were a drug on the market and remained unoccupied.

Beginning in 1907 plans and estimates for these important inprovements were approved and funds secured through bond issues authorized by the Legislature and the City Council. A start was made at Lake of the Isles, where a dipper and a hydraulic dredge, through four years of work, changed the alignment of the shore, deepened shallow water and filled all low lands and boulevards to a desired grade. This transformation resulted in some 50 acres of lawns, miles of walks, acres of plantings, and splendid driveways. Where there was formerly

100 acres of water area, 33 acres of dry land and 67 acres of swamp, there is now 107 acres of water area and no more swamp. The entire cost of the improvements, exclusive of bridges, was about \$175,000, or about \$875 per acre. Private properties within the lake district increased in value from 200 to 700 per cent. inside of five years.

The waterway connection between Lake of the Isles and Lake Calhoun was undertaken in the spring of 1910 and was completed in June, 1911. The length of the direct waterway between the lakes is 1,000 feet and the width 50 feet. Three bridges were necessary for the accommodation of existing road and railway traffic. Bridge

SCENE ON LAKE CALHOUN ON DAY OF OPENING OF WATERWAY—JULY, 1911.

No. 1 at Lake Calhoun is 116 feet wide and 168 feet long and accommodates the boulevard 32 feet wide, a traffic road 28 feet wide, an electric railroad right of way 24 feet wide, and two 16-foot sidewalks. This bridge is an elliptical arch with a span of 50 feet and with 12 feet of

TAKE OF THE ISLES ENTRANCE TO WATERWAY TO LAKE CALHOUN.

head room above standard water level. It is a reinforced concrete structure faced with cut granite and cost \$60,000

Bridge No. 2 is a reinforced concrete, double track railroad bridge of the flat slab type, made somewhat ornamental through line and panel work on outside of girders and parapets. It is a four-span structure giving 10 feet head room, providing for two 25-foot channel-ways and two 12-foot sidewalks. This bridge was built by the railroad company and cost \$28,500, towards which the Board of Park Commissioners contributed \$3,000 to

cover extra cost for ornamentation and style of structure.

Bridges Nos. 3 and 4 are three-centered arches, having a span of 50 feet. They are also reinforced concrete structures, faced with New Bedford limestone. Bridge No. 3 has a solid stone parapet, while Bridge No. 4 has an open parapet with spindles and posts. Both are very handsome structures and fit well into the landscape, of which they form a distinct feature. They are 50 feet wide and 116 feet long and cost \$28,000 each.

All bridges rest on pile foundations.

Bridge No. 4 is on the Lake of the Isles entrance to the Lagoon, connecting with Cedar Lake. This waterway

REINFORCED DOUBLE TRACKED RAILROAD PRIDGE OVER WATERWAY BETWEEN LAKE CALHOUN AND LAKE OF THE ISLES.

is 2,000 feet long and is spanned by a temporary railroad and a temporary highway bridge, which will eventually be replaced by permanent structures of similar type as those herein described.

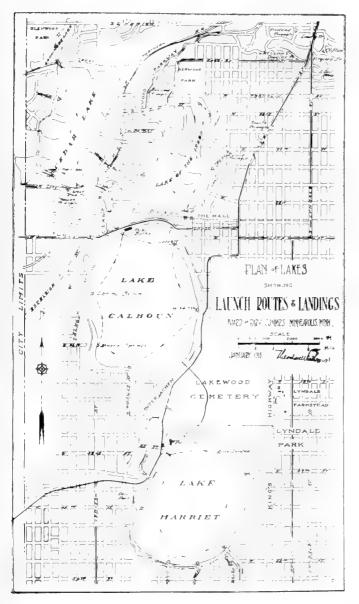

During the coming season Cedar Lake will be connected

LAKE OF THE ISLES ENTRANCE TO LAGOON TO CELAR LAKE.

with Brownie Lake at the foot of the wooded hills of Glenwood Park. This short channel, while only 500 feet long, necessitates the construction of a railroad bridge located directly under an overhead boulevard bridge. In other words, while crossing over the railroad on the boulevard bridge one crosses the waterway at the same time, which is below the railroad tracks.

The three waterways herein described and shown on the accompanying plan, connect four lakes which have a combined water area of 752 acres. The combined shore lines of all four lakes are 15 miles and the contemplated

walks, when once built, will be nearly 20 miles in length, and the boulevards  $7\frac{1}{2}$  miles.

The waterway excavations between Lake Calhoun and Lake of the Isles amounted to 92,000 cubic yards and cost \$13,340; between Lake of the Isles and Cedar Lake, 85,000 cubic yards costing \$14,200, and between Cedar Lake and Brownie Lake, 9,000 cubic yards costing \$3,500. The total amount of material moved, therefore, is 186,000 cubic yards at a total cost of \$31,040.

Extensive dredging operations have also been carried out on Lake Calhoun and Cedar Lake, the material consisting mostly of gravel and sand, which was used for boulevard and beach construction. At Lake Calhoun 473,000 cubic yards of material were so delivered, 100,000 cubic yards of which were needed for a large bathing beach.

At Cedar Lake 100,000 cubic yards were dredged for boulevard construction.

The Lake of the Isles dredging amounted to 419,000 cubic yards. The total amount of dredging done on all lakes and channels is 1,178,000 cubic yards, at a total expense of \$167,000.

In addition to that a bath house, costing \$65,000, has been built at Lake Calhoun, which accommodates 1,700 persons at a time, and has an attendance of about 300,000 per season.

The entire cost of all improvements, exclusive of land acquisitions, carried out within the district of the four lakes since 1907, amounts to \$550,000, and while this is a large sum of money, it is a comparatively small expense considering the value of these properties to the city as a whole and to its people. A large amount of work remains to be done to bring those park lands to the desired state of development contemplated, and large additional expenditures are necessary to complete the work. Time will bring the means and see it all done, and the concensus of the generation that will see it all an accomplished fact, will be that the money and efforts spent were a sound and splendid investment, which will bear compound interest for all time to come.

The series of articles on Pacific Coast Park Systems will be renewed in the April number.

# Construction Problems in Road Building\*

By Linn White, Illinois.

It is hardly true that the construction of every road or the paving of every street is an original problem in itself, requiring the collection of data and the independent determination of dimensions. For the sake of uniformity, if for no other reason, some standards must be adopted and rules formulated that are somewhat arbitrary and empirical. But, in spite of this necessity, the design of a road—width, depth and crown, as well as longitudinal grades and character of wearing surface—should be adapted to the traffic, soil, climate, drainage, etc., of the particular locality in which it is situated.

Widths of roadways are governed primarily by the extent and character of traffic. A highway may be designed for the passage of only two vehicles with no pro-

\*Extracts from a paper read before the American Road Publicis' Association, at Chicago, by the Chief Engineer, South Park Commissioners, Chicago, III. vision for standing next the curb, in which case the paved width can scarcely be less than 16 feet. As the importance of the highway increases and vehicles at higher speed use it and more provision must be made for standing room, foot passengers, etc., the width should increase to 18, 20 or 24 feet.

In a comparison between the paved width of streets and roads, note should be taken of the fact that in streets the whole width, including gutters, is generally paved and used by the traffic, whereas in speaking of the paved width of a road as, say, 18 feet, the earth shoulders and gutters are not included an additional width on each side of perhaps 5 feet, bringing the total width of such a road up to 28 feet. As an instance of the difference that may properly be made in the width of a street because of stopping and standing vehicles next the curb the following instance may be cited. One of the principal business thoroughfares leading out from the central portion of Chicago borders public park territory for more than a mile. A double-track electric car line was on the street, and on

the side next the park the pavement was made 12 feet wide from rail to curb; while on the opposite side, where the property was devoted principally to business purposes, the width was 18 feet.

Manifestly the strongest argument for keeping the width of pavements down to a minimum is that of cost, both of construction and maintenance, where the total width between property lines is not cramped. However, for certain reasons mentioned above, mainly esthetic, applying especially to residence streets, boulevards and highways, the pavement should not occupy the whole width.

The boundary lines of roads and streets are often encroached on by owners of abutting property and the actual width reduced by projecting steps, entrances, pilasters of buildings, etc. The laxity of supervision that permits such appropriation of public property to private uses cannot be too severely condemned. An encroachment once permitted is difficult to remove, and as time goes on is more and more objectionable. Encroachment on the public highway should be as vigorously guarded against as on private property. In the design of pavements sometimes features of construction are introduced that reduce the effective width, such as badly designed catch-basin inlets, excessive cross slopes, near the gutters, raised crossing and approaches to intersecting sidewalks, etc. There is nothing logical in a design that calls for a catchbasin inlet at the corner of intersecting streets with deep gutters and high curbs, and then, as a means of overcoming these unpleasant features, a raised crossing approach that forces traffic out towards the center just where congestion is the greatest.

In the improvement of country and suburban highways more latitude may be taken as to dimensions and character of pavement than on city streets. Conditions are generally more various. Location, grades, drainage, foundation, materials of construction, require more individual study and collection of data. A good road is the most potent factor in the upbuilding of a community, and it should be constructed to carry not only the existing traffic, but the increase that will be stimulated by the construction of the road itself.

Correct relation between the service demanded of a road and the elements of design, which include carrying capacity and durability, is essential in the construction of any good road. The proper depth or thickness of pavement is a large factor in determining the capacity and durability. Under modern conditions we cannot get away from constant maintenance if we are to have satisfactory roads and streets. Therefore it is impracticable to construct so liberally and permanently as to entirely resist wear. The Romans achieved this to a considerable degree in their roads, which were several feet thick, built of layers of stone blocks. So their principal roads or some remnants of them exist to-day, but do not meet any of the needs of to-day. They did not know, apparently, much of the art of sub-surface drainage or preparation of the roadbed to receive the stone; and while it is possible they may have crowned the surface to take away the surface water, there is little doubt but their roads were rough, dusty, non-resilient and generally unsatisfactory according to modern standards. Certainly, they would be now, and were then, expensive to construct. At that period there were but few roads, only between important points and principally for military purposes. Now the demand is for roads everywhere built as economically and as efficiently as possible. The thickness, no matter of what material constructed, should be the minimum compatible with intelligent planning. With all the foresight that can be exercised, a road good for this decade will not be good

enough for the next decade, all of which is but saying a large part of the road problem is a maintenance problem.

An efficient thickness of pavement involves all other elements of economical construction—proper underdrainage, compaction of subgrade, crowning and waterproofing of surface, etc.

With all the kinds of wearing surfaces that have been devised-stone block, brick, creosoted wood, asphalt and tar compositions, oiled and water-bound macadam, and the infinite variations thereof—there are only two recognized materials for foundations—concrete and macadam. The main difference in the action of the two is that concrete is practically homogeneous material, the particles positively bonded and knit together so there is a beam or slab action carrying the wheel road over a comparatively broad expanse of base, while macadam is made up of separate particles which are inter-supporting only and transmit the load from one particle to the others beneath. As one particle of stone in the surface may be supported by two, three or four particles immediately below, and each of them on an equal number in the next lower layer, and so on down to the earth beneath, we may reasonably estimate the wheel load is spread to the earth base at an angle of approximately 45 degrees in all directions. Thus, if the contact surface of a wheel is 4 by 6 inches, and the load on each wheel 2,000 pounds, it will be spread over approximately 2 square feet of supporting earth. If the supporting power of the earth is 1,000 pounds per square foot (authorities give from 500 to 2,500 pounds per square foot, according to character of earth, effectiveness of drainage, etc.), we may conclude our macadam foundation is thick enough to carry the load.

A concrete foundation will obviously spread the load to a greater extent than macadam, on account of its homogeneity and consequent slab action, and may be made correspondingly thinner. Consideration, however, must be given to the fact that the breaking strength of a 5- or 6-inch slab of concrete, made as such concrete usually is, cannot be very high. Cracks occur in concrete foundations on account of contraction, settlement, etc., which reduce the slab action.

There is another reason why concrete pavement foundations can safely be made thinner than macadam, and that is the greater stability of the mass or resistance to lateral displacement.

If there is a wearing surface of blocks, asphalt composition, or other material, on top of the concrete or macadam foundation it will further assist in the spread of the road. The transmission of the load to the foundation through a wearing surface of blocks can only be safely calculated in vertical lines with a surface contact the size of the block, on account of the vertical joints between blocks.

The thickness of the various types of wearing surface is mainly governed by practical reasons. It is not by any means true that pavement surfaces generally are to be improved by arbitrarily increasing their thickness. Two inches is probably the practical and economical thickness for asphalt and asphaltic concrete wearing surfaces, because before the two inches is worn away the inequality of surface becomes a serious objection, and a greater thickness would allow it to roll and shift when softened by hot weather. Creosoted wood blocks cannot be made less than  $3\frac{1}{2}$  or 4 inches thick, because the blocks would split too easily.

The crown of a pavement is a matter almost entirely of surface drainage. Even though a road or street has a considerable longitudinal grade, it is necessary to carry the surface water to the gutters. The crown probably

(Continued on page 139.)

assists somewhat in keeping the central portion of the street clean, as dust and dirt are more easily swept to the gutters by rain, winds and passing traffic. As far as the use of a pavement is concerned, it would be more desirable to have it level in cross section, and under certain conditions safer. A vehicle turning on the outward sloping crown of a road is pitched in the wrong direction, and if the pavement is slippery, tends to slip or skid. The outer rail of a railroad is raised on curves to assist in turning the curve and the better to resist centrifugal force. On a street pavement the inner rail, so to speak, is raised, and, according to any method of construction yet developed, necessarily so. The problem is to reduce the crown as much as practicable and establish reasonable rules for distributing the pitch fairly evenly across the width of roadway. The character of wearing surface has much to do with the amount of crown permissible.

The following list of pavement surfaces is arranged in

the order of amount of allowable crown:

Water-bound macadam—Oiled and tarred macadam (surface treated) — Stone blocks — Brick — Bituminous concrete (mixed before laying)—Sheet asphalt—Creosoted wood blocks—Portland cement concrete.

In this list creosoted wood block is put near the bottom because it is a slippery pavement surface and needs a flat crown. Also, by reason of the true surfaces and gauged size of blocks, it can be laid close to a theoretical grade. Portland cement concrete is put at the bottom of the list, not because it is slippery, but because on account of construction methods it can be screeded or struck to a fairly exact grade, whereas other plastic pavements, bituminous concrete and sheet asphalt, cannot be made so exact on account of the necessity of rolling after spreading to secure compression.

If the longitudinal grade of the pavement is practically level, the crown must be greater at catch-basin inlets than at gutter summits between inlets, unless the grade of the center of the roadway is carried up and down with gutter less on the increased crown section.

grades, which is not a desirable method. On streets with longitudinal grades requiring water in gutters to flow all in one direction, and on country highways where drainage is carried away by surface ditches, the crown may be made the same at all points.

The cross section of a pavement may be a segment of a circle, parabola, or two inclined planes connected with a segment of curve. Either of the two latter forms is preferable to the first, because a segment of a circle makes the pavement fairly flat in the center and grows unpleasantly steeper near the gutters. The inclined planes or parabola "get away" on a quicker slope from the center and do not so materially increase as the gutters are approached. Traffic, then, will use all parts of the pavement with fairly equal facility and ease.

Whatever theoretical crown or cross section is adopted, it should be remembered that in actual construction the cross section will be only approximated. It is not practical to set enough grade points or to maintain them care-

fully enough to attain the theoretical section.

In practice, in setting grades for crown or cross section, it is common to adopt a rule of measuring, say, onehalf the distance from the center and dropping one-fourth the total crown. This will give a segment of an all-curve cross section. Another rule may be to measure two-fifths the distance from the center, drop one-fourth of crown and thence straight to the gutter. Other modifications of such simple rules may be devised, using three points on wide roadways between center and gutter, approximating more closely to a true parabola or providing longer inclined planes and shorter connecting curve. It is sometimes advised to increase the crown on pavements having considerable longitudinal grades, thus carrying the water more quickly to the gutters. The opposite practice is generally better-to decrease the crown on steeper grades. There are two reasons for this—the tendency to slip or skid is less, and the washing or cutting action of water is

# Horticulture at the Panama-Pacific Exposition

By G. A. Dennison.

The growth of the great industry typified by the Department of Horticulture at the Panama-Pacific International Exposition can be better appreciated when we realize that it was found necessary at this exposition to devote an entire department to its portrayal—a recognition which has never before been accorded to horticulture at an international exposition. The comprehensive scope of this exhibit, the plan underlying it all, and the artistic presentation of the "best of the best" from the horticulture of the many nations participating will make it historic as well as vastly entertaining and instructive to all who join the exposition's throng.

The aim of the department has been to present the advancement which has been made in the past few years by each branch of the horticultural industry. From what is known as the great back-to-the-land movement, the creation of fine country estates and the advance of scientific application to horticultural pursuits, there has arisen an insistent demand for orchard products of the highest merit, and for a more comprehensive treatment and a more intelligent application of ornamental trees and shrubs. The making beautiful of a practical thing is a great influence spreading over the country.

The horticultural exhibit will include displays from Japan, England, Scotland, Ireland, Australia, New Zealand, The Netherlands, France, Argentine, Cuba, the

Philippines, Hawaii. and the following States of this Continent: Oregon, Washington, Utah, Idaho, Montana, Nevada, California, Colorado, Kansas, Missouri, Arkansas, Illinois, Iowa, Indiana, Ohio, New York, Massachusetts, Rhode Island, Pennsylvania, New Jersey. Florida and Maryland.

The general plan of this exhibit is based on three divisions: The outdoor, the conservatory and the economic

display

A garden of nine acres lying to the south of the Palace of Horticulture and in front of the Inside Inn has been set aside for the outdoor exhibits. Every participating State and nation have part of its horticultural display in this garden. The Netherlands and the State of Massachusetts make their displays exclusively in this section. Holland's unified exhibits are presented under the auspices of the National Board of Horticulture of the Netherlands, personally represented by their expert, Airie Van Vliet, and is of such character as to represent the quintessence of the floral culture industry of that country. The material shown was commandeered by the national organization, so that only the finest specimens are on display. Not one member of the organization is advertised—it is a collective display representing the growers as a whole.

A flowering mass of 60,000 bulbs is but an item in this

gorgeous part of the exposition. Trees which have attained their growth in their native Dutch soil, large beautiful and flourishing in their environment alongside rhododendrons, trained conifers and numerous growing botanical specimens all planted in relation to a definite landscape garden effect, designed by D. T. Tersteeg, of Maarden. Holland, the most noted among the famous landscape architects of his country, will be shown in this exhibit.

The Japanese garden display is made under the direction of the Government Bureau of Forestry. The landscape treatment, which is a work of art, is the design of Hannosuke Izawa, the greatest of Japan's landscape architects, and it holds many a surprise for the exposition visitor.

The display of Massachusetts, representing the combined

offerings of her best growers, constitute a Colonial garden, in which a fountain and sun dial are ornamental features. The landscape treatment here, planned by Stephen Child, one of the foremost in his profession in the United States, has a thoroughly practical side, while being also a masterpiece of beauty, as it is designed as an object lesson showing how to make the most effective use of the trees and other forms of plant life represented.

One of the greatest and most interesting divisions of the outdoor horticultural display is the California Garden. This has been laid out by Carl Purdy, who is best known for his world for the first time at this exposition. A spacious rose-bed set apart for these lovely flowering competitors will be a spot of novel beauty. Whatever rose receives the vote of honor will be given a name commemorative of the great exposition in which it grew and blossomed into world-wide fame. Among the renowned rose growers who have entries in this contest are Hugh Dickson, Ltd., Belfast, Ireland; Samuel McGredy & Son, Portadown, Ireland; E. Pernet-Ducher, Venissieux-Lyon, France; Dobbie & Co., Edinburgh, Scotland; S. Bide & Sons, Ltd., Farnham, Surrey, England; E. G. Hill, Richmond, Indiana; Howard & Smith, Los Angeles; The Brant-Hentz Flower Co., Madison, New Jersey; John Cook, Baltimore, Maryland, and Peter Lambert, Trier, Germany.

It has been our endeavor to individualize the displays

FHE PALACE OF HORTICULTURE. THE DOME IS PATTERNED AFTER THE MOSQUE OF THE SULTAN AHMED I AT CONSTANTINOPLE AND IS 152 FT, IN DIAMETER AND 185 FT, HIGH.

VIEW SHOWING LANDSCAPE TREATMENT BEFORE THE MAIN EX-HIBIT PALACES, THE PALACE OF LIBERAL ARTS TO THE LEFT AND DOME OF HORTICULTURAL PALACE TO THE RIGHT.

original botanical work which has made possible the domestication of California wild flowers.

In that portion of the outdoor exhibit known as "The Eastern Garden" is a general area for the miscellaneous exhibits not grouped with the bulk of growers' displays. Here will be found a magnificent exhibition of roses from Rhode Island and Maryland, wonderful new heliotropes of exquisite color and rich fragrance from New Jersey, iris and peonies from Pennsylvania, and countless other delicate beauties from the many flowering zones of the world.

Great interest has been excited among the rose growers of all nations by the International Rose Contest in which the exposition offers a \$1,000 trophy for the finest seedling rose, unnamed and heretofore unexhibited, but which is to be brought forth for the admiration of the

in as far as it is possible. The growers have not submitted selected specimens of all the sorts they sell, but instead each has contributed the one, or two or three varieties which he has brought into being. Bertrand Farr, Reading, Pa., sent a splendid display of 400 varieties of iris; while among the interesting new offerings, Charles H. Totty, Madison, N. J., has a heliotrope of richest perfume and with many attributes lacking in older varieties. This has never before been shown and, as he permitted me to

choose a name for it, I named it for my mother, Elizabeth Dennison.

Considered apart from its relation to the varied exhibits which it will domicile, the Palace of Horticulture is in itself a feature. It is one of the most attractive palaces on the grounds, and the most striking architectural triumph created for any exposition. Whether the sweep of the exposition's 635 acres is viewed from the distant hills or from the bay, this commanding edifice attracts attention and admiration. It is colossal in size, 672 by 320 feet; made almost entirely of glass, surmounted by a hugh glass dome, 185 feet high and 152 feet in diameter, larger than that of St. Peter's at Rome; and was erected at a cost of \$341,000. The decoration and rich ornamentations have the French renaissance feeling. The numerous smaller domes that surround the building are of lat-

tice where rare vines will intertwine and flowers bloom to give added beauty to this structure typical of plants and flowers.

Here the different parts of the world will be represented by choice and magnificent specimens. Tropical fruits, shrubs, flowers and palms from many countries are massed here, with vines that festoon the whole until it promises a resemblance to a tropical jungle.

Under the great dome the visitor will find a tropical garden, the exhibit of Cuba. Growing in this garden will be an elaborate and representative collection of trees and

INJUIDIT OF AQUATICS BY HENRY A DRIER AND

other plants which made fourteen carloads when brought from that tropical country.

The corner triangles created by cutting out this great circle are filled with pools that afford appropriate setting for an assemblage of aquatic plants of every variety. A remarkable collection of Henry A. Dreer, of Philadelphia, and another equally notable one of William Tricker, of New Jersey, attract well deserved attention.

The Hawaiian exhibit in the Palace of Horticulture is made under the direction of the United States Department of Agriculture. A large collection of hibiscus, one of the many forms of floral life native to Hawaii, will be displayed with splendid specimens of Cybotium Henriesi. Among the pleasures offered the visitors is a visit to a miniature pineapple plantation. Australia will exhibit giant ferns whose

size eclipses any ever heretofore shown in America. Here also will be found an opportunity to see a bit of old Japan, with its quaint and oriental aquariums of gold fish surrounded with thickly growing bamboo and other plants peculiar to this strangely fascinating country. In the Philippine Building and forming part of the exhibit of this department is a great floral treasure bed, rank and beautiful with a blooming exhibit of over 400 varieties of dainty orchids, blending their wealth of colors in one indescribable picture.

The economic section of the horticultural exhibit will also be housed in the Palace of Horticulture. The domi-

nant idea in the displays presented here is to show plant life and its products in relation to actual use—rather than to mass objects of curiosity and rarity for idle sight-seeing purposes. Herein the horticultural exhibit at this exposition marks another distinct departure from precedent and places itself on a unique and practical basis. As a whole this part of the exhibit will be a great industrial demonstration of instructive value and interest showing processes as well as products. This whole will be made of individual exhibits, in separate booths comprising both State and foreign displays.

The fruit displays are many and various. The State of Washington features its specialty in an apple sizer in operation and the packing of fruit. A fig grader is also shown which separates the sizes.

An ingenious display of horticulture machinery will show practically everything up to date in the line of appliances and implements used in the care and handling of soil, plant forms and their products. While, perhaps, the most vitally interesting exhibits will be those showing the natural and artificial methods of combating insect pests, fungus diseases and parasitic growths affecting ornamental trees and plants, a display of wonderful beauty will be made of objects of garden ornamentation of which fountains, garden seats and statuary are examples.

As a whole the horticultural exhibit of the exposition has been planned with a five-fold purpose, to appeal with

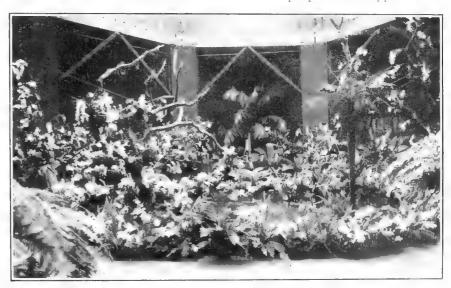

EXHIBIT OF ORCHIDS BY MACRORIEMACTARES CO

equal interest to the tourist, the visitor, the student, the business man and the investor. The tourist will see the pride and glory of the soil from the "other sections of the world." The visitor will be entertained by the beauty and novel wonder of all that is before him. The student will find here an unequaled opportunity to increase his store of knowledge on all points pertaining to the horticulture of the earth. The business man will find the exhibits of commercial products so arranged as to permit the placing of orders on the spot. The investor will be able to discover through actual living evidence of productive possibilities of soil from every section of earth.

# Six Months of Spencer Sweet Peas

By Thomas Ryan, New York.

For spring blooming, Sweet Peas under glass, seed should be sown at the end of September, preferably in the propagating bench. Examine the seeds at the end of a week and those still hard should be filed or chipped, for some hard-coated varieties will remain weeks without germinating unless given this treatment. Do not water the bench unless necessary, as many varieties will surely rot (especially the seeds of the white ones) if the sand is kept wet. In ten days to two weeks the seedlings should be ready for potting, for it is not advisable to let them remain too long in the sand. The seedlings are easily handled at most any stage of their growth. Pot off into four-inch pots and place in cold frames. Along in November they should be covered at night, but give all air possible in the day time. Leading shoot should be pinched out to induce breaks from base. By the first week in December these should be sturdy plants; if the

as nothing but a long stem will result from so doing. Grown cool by the middle of February they should not be more than three feet high, but if forced will easily double this. About this time to the first of March buds will be showing at end of shoots, and they can now be given a few degrees of higher temperature.

Blasting of buds will likely appear on first crop of flowers, but beyond losing a few flowers will do no harm. All breaks at base of flower stems should be pinched out and all growth from now on should consist of one leaf to every flower all up the stem. When the growth has reached to the top wire, commence at bottom and cut away ties, pull the stem down and let it hang down. It will do no harm unless it gets kinked too much. By following this method a twelve-foot stem can be grown with very little head room. These should be throwing fine flowers with grand stems in April and May. Countess

MRS. W. J. UNWIN.

CHARM.

ORCHID.

weather keeps mild let them stay in cold frames, if till the end of December so much the better. At this time the plants should be taken in the house and planted, preferably in boxes as they are more easily handled this way and can be taken outside again in the latter part of May where they will continue to bloom outdoors. It is better to keep in house, if possible, till the outside grown ones commence to flower. Boxes should be eight inches in depth, about ten inches in width, and any length desirable, which should be filled with good garden soil (no manure). Try to give the plants four feet of head room, plant twelve inches apart, save the three strongest looking shoots, and cut all others away. Run one wire along top and one at bottom, string these wires from top to bottom three strings to a plant, one for each shoot, and as they grow keep tied to strings with raffia. All tendrils on leaves and breaks from base of leaves should be kept pinched out and leaving only the leaving growing on stems. A carnation house is good to grow a few boxes in, as this temparature suits them. Do not force them, Spencer, grown under these conditions, has thrown stems two feet and two inches in length. Feeding roots will be seen working on the surface of soil in March, and in April boxes should be top-dressed, not too heavy, but a little at a time with good soil. Along in April the plants can be fed with liquid manure made weak but applied quite frequently once a week, in May twice a week. A few good varieties for indoor growing are:

King White in white, Countess Spencer and Elfreda Pearson in pink, Barbara in orange, Irish Belle in lavender, Dobbie's Cream in yellow, Margaret Madison in blue, Scarlet Emperor in scarlet, May Campbell Senator

Spencer and Loyalty in striped.

In addition to the foregoing suggestions, a few hints may be given on watering. A good watering when planted in house should last about a month, as growth in January will be very slow and the soil should not be kept too wet.

While the growing of these varieties hardly pays under glass now that we have the winter-flowering orchid

varieties, still where high grade flowers are required of Sweet Peas and as long a season as possible, this system and the following one outside will give the highest grade of flowers for five months in the year, and where climatic conditions are more favorable to the growth of the Sweet Pea than here I have no doubt could be extended to six months.

For flowering outdoors seed should be sown the first to middle of February, potted into four-inch pots and kept in house till middle of March, then placed in cold frames till middle of April when they can be planted outside. For those having no greenhouses a good method is to sow two or three seeds in a four-inch pot about the middle of February and place in frost-proof cold frame. Keep all heat in possible till germination, keeping the strongest seedling and pulling out the others. Trenches for planting these in should be dry, preferably in the fall, at least two feet deep with a dressing of lime given and left open all winter. In spring a dressing of well rotted manure should be placed along bottom of trench and well tamped, one barrowful of manure to every twenty feet of trench filling will be plenty. When trenches are filled up give a good tamping, leaving them slightly depressed. A row fifty feet long will need five stakes: three-quarter or half-inch pipe is good for this purpose, and they should be six to seven feet high above ground level. Along these stakes run four rows of wire; up against and tied to these wires place cane stakes pressed into ground a few inches, four inches apart the length of the row. The very cheapest thin Japanese can stakes are good. The trench is now ready for planting and will require fifty plants each, one grown to three shoots. Each shoot has its cane stake which it should be kept tied to and treated the same as indoors. Buds will probably appear on these plants when they are a foot high, but should be pinched off. The orange and reds will need shading; cheese cloth is good for this purpose; light frames should be made twelve feet long and on this the cheese cloth can be tacked. When picking for exhibition try to pick day before show and place in cool, dry place; do not crowd blooms in vases, as they will develop wonderfully if given room to do so. In staging give preference, if possible, to bright colors, and in the small classes have them all bright colors. The varieties before mentioned are all good for outdoors with the addition of:

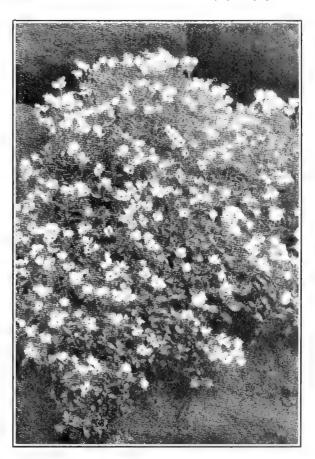

Edna Unwin, orange scarlet; Edrom Beauty, orange pink, a beauty, but bloom very soft; Hercules, pink; Doris Usher, cream and deep pink; Inspector, orange; Mrs. Cuthbertson, rose-pink, very large; Mrs. C. W. Breadmore, cream, edged pink; Nubian, chocolate; Rosabelle, light rose, very large; Thos. Stevenson, orange-scarlet; Lady Evelyn Eyrie, blush-pink, the largest of all; Paradise Carmine, stands out by itself in this color, but seed very difficult to obtain.

Extra fine blooms can be obtained by selecting buds eight to ten days before show by pinching out the entire head of shoot above the flowering stem in which the buds can just be counted. Care should be taken though to let a break come alongside the flowering stem, which will take the place of the pinched top. Watering should be done at the rate of five gallons to a plant once a week.

## AUBRIETIAS IN THE SPRING GARDEN.

Those who make careful use of the best spring flowers have been rejoicing in some recent improvements in the Aubrietia. Among these the most valuable of those now well known is the beautiful variety Lavender, of good size, fully bloomed and of true Aubrietia color. In the

progress of variation of a garden plant, growers are apt to overlook the best purpose or intention. The lures of size, novelty and variety are often illusive; they attract and lead into blind paths. The thing to look for is the purest beauty of which the plant is capable. In the matter of coloring in the Aubrietia the very finest quality may often be picked out in a batch of seedlings of the type A. graeca. It is a clear, pure lavender purple rather light than deep in tone. We are grateful, writes C. Jekyll in the Garden, for the fine deep-colored variety Dr. Mules, but to the artist-gardener it is not a plant to use by itself in large quantity. Its value is best shown when a few plants are grouped with a larger number of a good form of the more typical coloring. Of the heavy reddish colorings, and even the deep purples inclining to reddish, as far as my own feeling and experience are concerned, they are better avoided altogether. The only colorings with anything approaching a reddish tint that seem to me desirable are the very beautiful palest pink Moerheimii, of Dutch origin, and a slightly darker one, called Bridesmaid. Both are extremely pretty plants and

A SPECIMEN PLANT OF AUBRIETIAS IN A ROCK GARDLY

go well together. For the present the pure, rather light colored kinds resembling the fine Lavender would seem to be the best.

The absence of the white eye makes the flower much more effective in the mass. I am of opinion that the size of Aubrietia bloom should not be further increased. It is not in the nature of the plant, a true alpine, to have large flowers. The mass of small blooms of good form and pure coloring is the true character of the plant and the source of its charm and attractiveness. These charming spring flowers deserve to be more widely grown, both in the rock garden and the border, than they are at present. Their cultivation is not difficult.

# Work for the Month of April

By Henry Gibson.

PLANTING TREES AND SHRUBS,

With the advent of April real activity begins in the outdoor departments of the garden. The change from the routine of winter is a welcome one, and a pleasure

When the ground is in good working condition the planting of trees and shrubs should be proceeded with. As soon as the frost is out of the ground this work can be done, but often the soil is wet and soggy at the time, which prevents close contact of the soil with the roots. In the actual operation of planting, close contact of roots and soil is most essential to success. The soil should be rather dry than wet, so that when filling in around the roots it will fill up the crevices completely. Sandy soil, or even sand itself is excellent for this purpose. It should be used only until the roots are well covered, and then the usual soil can be utilized for filling in. Ramming at the soil also helps to put it in closer contact with the roots. Watering too is always of use in that it places water within reach of the roots, and in soaking down it carries the soil into closer contact with the roots, than can be done by any other means.

Pruning of the roots and branches is a part of the planting operation that should not be overlooked. Nurserymen always endeavor to preserve as many roots as possible when digging the stock from the nursery, but no matter how careful they are, some roots are sure to be damaged. All such roots should be cut off to a smooth surface previous to planting. From a clean cut surface fibrous roots, which are the active agents in the absorption of plant food from the soil, are more freely emitted than is the case from a ragged broken surface. Pruning of the branches can be done at the same time, cutting out weak ones entirely, shortening back others, especially such as are misplaced. It is claimed by some authorities that deciduous trees should be planted before evergreens, but we believe that both require early planting. Of course there is deciduous stock that is impatient of growth, and pushes into leaf early. These demand attention first, for if they are overlooked until the foliage is well developed their success is not so certain.

Much disappointment is often expressed at the loss of the flowers of the early flowering shrubs. This is undoubtedly due to their being planted in unsuitable positions. The north side of the house, banks, walls, or other buildings is the most suitable place for them. Here their buds are not advanced and started into growth by the warm sun of late winter, only to be killed by a belated cold spell.

### LAWNS.

It is at this time of the year that the soaking rains and melting snow of winter are of benefit to the lawns. With plenty of moisture in the soil, and the warmth of the spring the grass will soon get into active growth, and assume that rich green tint that all welcome. Any renovating that is to be done should be attended too as soon as convenient. Moss should be raked off, weeds rooted out, and top dressing of a good garden loam applied previous to sowing seed on bare spots.

A general top dressing for lawns that are anyway impoverished is made up of 1½ pounds of nitrate of soda and 1 pound of fine bone meal thoroughly mixed together and applied at the rate of six cwt. to the acre. Two parts of good loam and one of sheep manure is also good and less expensive.

BULBS AND PERENNIAL BORDERS.

The material that has been used for protection on the bulb beds and perennial borders should be removed as soon as possible. The weather is considerably warmer now, and heavy protection left on too long tends to set up premature growth which when uncovered is easily killed by very little frost. In case when there is much young growth, it would be advisable to leave on a light covering, until the weather is more settled. It will also be necessary when doing this work and especially on the beds of bulbs to take care that none are broken. Many of the bulbs will have made growth that have penetrated well into the material used for protecting them and by the careless removal of same much damage can be done.

The present month is a good time to make a new border, extend the old one, or do any transplanting and

rearranging that may be necessary.

A perennial border is to be permanent for some years at least, so see to it that soil is deeply dug or the trench is well enriched with well rotted manure. A good coating of bone meal and wood ashes would also be beneficial. Select a place for the border away from large trees and shrubs, which rob the plants of much of their sustenance. The time to plant is just as the plants are emerging into new life. If you are dividing up old clumps do not cut them into pieces with the spade, thus destroying many of the roots, but force them apart by placing two digging forks back to back. The outside and younger portions of the clumps are more vigorous than the older central portions and are to be preferred for replanting.

See to it that each plant has plenty of room to fully develop, massing them in conspicuous groups that will make one sit up and take notice is far more satisfactory than dotting them here and there. Blending the colors is also important, so as to avoid having too many of one

shade together.

#### HARDY ROSES.

The planting of hardy roses should be proceeded with so as to have them established as early as possible. Roses require a situation with a southern exposure where they can have full sun all day, and some shelter from north winds. While they will grow and give good results in almost any fertile soil, yet the ideal rose soil is a deeply

dug, well drained retentive loam.

If the soil is naturally poor it can be renewed with old sod from an old pasture, to which has to be liberally added well decayed cow manure. When planting take into consideration the vigor and growing habits of the plants you are using. About three feet apart will be the limit for the stronger growing ones and eighteen inches for the weaker ones. Should the plants be on their own roots there will be no suckers to contend with and shallow planting will be all right, but in planting grafted stock it is advisable that the union is two or three inches below the ground surface. By so doing the trouble from suckers is considerably lessened and the union is kept in better condition. Dig the holes sufficiently large to allow the roots being spread out, and work the soil well among the roots, leaving it well firmed.

Pruning also should be attended to, both of the newly planted roses and those already established. There are two main objects in pruning roses that should not be overlooked, viz.: the production of new wood and the removal of all weak and superfluous growth, so as to direct the energy of the plant into the remaining growth.

and at the same time let in a maximum of light and air. No hard and fast rules can be laid down in garden operations, but in pruning roses it is quite safe to say that the weaker the growth is the harder it should be turned back. Leaving three or four good buds of last season's growth is what is needed on the weaker growths, and the stronger ones can have a foot or two cut away and then be tied or pegged down.

#### PRUNING HARDY CLIMBERS.

There are a number of hardy climbers that should be pruned at once if the work has not already been attended to. Among these may be mentioned, Wistarias, Clematis paniculata, Bigonias, Loniceras, Dutchman's pipe, etc. Cut the Clematis paniculata back quite hard for best results. For English Ivy and Euonymus radicans no pruning is necessary at this time but any dead shoots on the ivy would be better removed now. The pruning of climbing roses is as well deferred as long as possible. If they are pruned too early they start into growth at once with a warm spell, and if a cold snap immediately follows much injury results.

#### SWEET PEAS.

Few subjects have received more attention from horticultural writers than the care of Sweet Peas and how to obtain the best results. No matter how detailed may be the notes on their culture one important point seems to be overlooked when reduced to practice and that is the necessity of working the soil deeply. We mentioned last fall in these notes the necessity of trenching the soil deeply. Sweet Peas cannot withstand the heat of July for any length of time when the soil has only been dug a few inches deep. Give the roots a chance to get down into the cool moist earth and note the difference during the hot weather. The heavier your soil the deeper it should be worked and the finest plants will result. Have the seed sown as soon as the ground is in condition to work. Sweet Peas make their best growth during the cool weather. If you have started seed in pots don't wait too long before you put the plants out. A little touch of frost won't set them back very much. Have the supports ready too, whether it be chickenwire, twine, or brush. It is better to have these in place early, so long as there is room for the cultivation, than to have to rush them in place when the plants are a foot or more high.

### PLANTING GLADIOLI,

Sort over the Gladioli and select the smallest bulbs for the first planting and keep the larger ones for later use. A succession of plantings can be made from the time the ground is fit to work until the end of Tune. Have the

the ground is fit to work until the end of June. Have the rows from two to three feet apart and plant the bulbs 3 or 4 inches apart in the rows and at least 4 inches deep. The ground should be deeply worked and a good dressing of old cow manure incorporated with it. When the plants show above the ground keep the cultivator busy.

### THE VEGETABLE GARDEN.

This department calls for a good deal of attention at this time, but in one's anxiety to get the seeds in as early as possible care should be taken to avoid sowing in wet cold soil. String beans especially should have warm and reasonably dry soil to germinate in. Early varieties can be started in cold frames with much greater chance of success than is the case in the open ground until the weather becomes settled.

Potatoes for early use may be planted in a sunny border, where annuals are to go later on. It takes a little judgment to make these things fit in but it can be done. Potatoes take from 80 to 100 days to mature in ordinary seasons, and should be out of the way, by bedding out time in the majority of localities.

Parsnips require a long season of growth, but for ordinary table purposes there is plenty of time to get them in. For the exhibition table, however, they should be planted as soon as possible. These call for a little more than ordinary culture if they are to be winners. Thin out to twelve inches apart as soon as the little plants can be handled and give those left every encouragement in the way of watering when needed, and occasional feeding to help them along.

#### SUCCESSION CROPS,

Lettuce, radishes, cauliflower, cabbage, beets, carrots, etc., may be sown for succession. Small batches sown at frequent intervals are always more satisfactory in that they are young and tender than is the case if large sowings were made less frequently.

Musk melons, cucumbers, eggplants and peppers, should be sown early either in the greenhouse or hotbed, for planting out to provide early crops.

These plants will undoubtedly be subject to various temperatures, so it will be well to grow them as sturdy as possible. Eggplants do better in a warm moist atmosphere where the night temperature is between 65 and 70 degrees, but for any of the others 60 degrees should not be exceeded.

## THE GREENHOUSE PLANTS.

### POINSETTIAS.

Stock plants that have been stored away on their sides under the benches since last December with little or no care should be brought out and prepared to start into growth. The old soil should be removed from their roots, and then they can be potted into such sized pots as will conveniently hold them. If put into a rose house, temperature kept fairly moist they will break into growth in a few weeks and provide fine material for propagating from.

### CANTERBURY BELLS,

It is from now until way into July that Canterbury bells are at their best. Where it is intended to grow these plants for forcing, next spring seeds may be sown any time now. Sow the seed thinly so that the seedlings do not become crowded at an early stage. Prick off three inches apart, as soon as they can be handled nicely. In June they can be planted out in the garden where they will remain until late in October. With good culture they will develop into fine plants with strong crowns for forcing.

#### SHADING.

With the increased sun power it will be necessary to apply shading permanently to such plants as violets, palms, ferns, orchids, etc. It is always better to do it before any of the foliage becomes scorched. Too dense shading is conducive to soft growth and should be avoided. While it is important that the direct rays of the sun should be excluded, yet all the light possible should be afforded the plants.

THE April number of "Gardeners' Chronicle" will contain articles on Flowers for the Hardy Garden, by Bertrand H. Farr—Growing Exhibition Dahlias, by P. W. Popp.

### GROWING STRAWBERRIES FROM SEED.

By C. H. Chamberlain, Massachusetts,

To those desiring something interesting and with great variation in results, let them try growing strawberries from seed. First start with some definite object in view. As an example, I will give the results of one of our experiments along this line. Our object in doing this was to obtain, if possible, a vigorous growing, large, everbearing, nice flavored strawberry. In 1906 we planted side by side the Marshall and Pan American varieties, allowing the bees to do the fer-tilizing of the blossoms. The following season we saved the best berries from the Pan American plants, sowing the same in August in boxes of one-third peat, one-third garden soil, one-third sharp sand, sifting the same and covering the seed lightly, keeping the same under glass with plenty of moisture, and keeping them over winter in the green-house, planting into the open ground in May. Most of these plants, about 2,000 in number, produced berries the second season. Results were we had berries like both parents. We had strawberries large, small, good flavored and poor, one crop, two crop, and all season bearing, and some that never bore at all. Some put on plenty of runners, others not

After several years' discarding we have three varieties left; all are vigorous growers, one bearing two crops in a season of large nice flavored berries, and producing a few runners; one bearing three crops in a season of large perfect berries of a tart, woody flavor producing a quantity of runners. The other, which we have named Ideal, a vigorous grower bearing in quantity all the season from June 15 to freezing, large perfect berries of a strong wild strawberry flavor and producing a great quantity of runners. This variety we intend to introduce soon. This berry (Ideal) received a first class certificate of merit from the Massachusetts Horticultural Society at Boston, in August last. While we have never tried forcing any of these varieties under glass, we have every reason to believe it would be a success. Growing strawberries from seed has been the most interesting cultural experience I have ever had, and at small expense.

## GROWING CANTALOUPES.

After a thorough preparation of the soil (almost any soil well drained and not sour) by deep plowing and an unlimited amount of harrowing, mark the land off at right angles, six feet apart each way, making holes at intersecting points about 15 inches in diameter and 5 inches in depth. Into these holes place about one-half shovelful of well-rotted stable manure, preferably horse, or horse and cow mixed, then cover lightly with earth, scatter about 25 melon seeds, covering these with one or more inches of earth, and pat down lightly with hoe.

It has been, of late years, a weather gamble regarding these early outdoor plantings, as to whether the seed will germinate or not, and, to overcome this trouble, a successful grower for the hotel trade relating his experience in the *Market Growers' Journal* says, he now resorts to the greenhouse planting the seeds in strawberry baskets or dirt bands, during the latter days of April and transplanting to the field about June 1. By using ordinary care in having composted soil in baskets damp clear to the bottoms, he removes them without disturbing roots in the least, setting out acres of them very rapidly and seldom losing a plant.

He makes two thinnings, the last time leaving but

three plants in a hill and when the main stems of vines are 12 to 15 inches high nip the ends, leaving four to six laterals or side branches to come, a sufficient number to carry all the fruit the vines are able to properly develop. He prunes again the ends of these laterals when their growth becomes rank, thereby hastening the fruit to maturity.

Everything possible should be done for the quick growth of the vine. A teaspoonful nitrate of soda is scattered around each hill—not on plants—when melon vines are 4 to 6 inches high; frequent stirring of top soil one or two inches deep to aerate soil and conserve moisture, as well as to keep down weeds, is very necessary. Before the vines commence to run much it is advisable to spread on a good coat of highgrade fertilizer, rich in phosphoric acid, along the rows between plants, and harrow in with cultivator.

A very important thing, and one that this grower has never seen done outside of his own grounds, is to go through vines when melons average the size of a cocoanut or thereabouts, and turn each one upside down, that is as large as an orange or larger. When this is not done the lower half is not as thick fleshed as the upper one, is softer and ripens first, is liable to rot and the shell may be penetrated by crickets and wireworms. Turning them over and exposing all parts alike to the sun adds also both to flavor and appearance.

He never picks melons till they part naturally from the vines, indicated by the cracking of the fruit around the stem, nature's way of telling us when they are weaned.

### VALUE OF LIQUID MANURE.

When the ground is thoroughly moistened to a considerable depth liquid manure may with advantage be applied to the roots of fruit-trees. The reason for this is that the soil, being full of moisture, it acts as a filter, so to speak, arresting and holding in suspension the manurial constituents present in the liquid while the residue or water passes on down to the subsoil. If applied in sufficient quantity to thoroughly saturate the ground beneath the trees, the soil then becomes considerably enriched, and the roots will, in turn, benefit to a large extent thereby. It should not be applied indiscriminately or to all trees alike, as it in some cases—for instance, trees full of vigor—would do more harm than good. Trees that do benefit by its application are such as make weak growth, and those which are in full bearing, while for trees that have, as a result of heavy and continuous cropping, begun to exhibit signs of exhaustion by a falling off both in the size and quality of the fruit, it acts as a wonderful restorative. Unless the liquid is very strong—in which case dilution is necessary—it can, now that the trees are, as far as growth is concerned, resting, be used as taken from the tank.

Not only should trees in the garden be given such attention, but it should be extended to those in the orchard, especially when the latter is in grass. In every case the liquid should be applied to as far as the branches of each individual tree extend, and sufficiently so that the soil is well saturated. If any difficulty in getting the liquid to sink in is experienced bore holes 2 feet deep and some 18 inches apart. On sloping ground the soil must be ridged up on the lower side to prevent the liquid running to waste. In some cases a kind of basin formed round the tree is also necessary to ensure the liquid reaching the roots.—

Exchange.

## Transplanting Large Trees\*

By C. E. Hunn, New York.

The transplanting of small trees is a comparatively easy operation, but when large trees are to be moved it is absolutely necessary to employ the professional tree mover, one who has the tools and the experience. The latter is of as great importance as the former. The modern tree moving machine, while of simple construction, has many complications as to levers, chains and ropes,

A TREE PLANTED BY YEARS AGO, IN TROCESS OF BEING TIPPED OVER ON TRUCK TO BE TRANSPLANTED

so that an amateur would be hopelessly puzzled in an attempt to manipulate it. At least one man with a thorough knowledge of the operation should be in charge of the removal.

Perhaps a brief statement regarding the removal of ten large elms on the grounds of the State College of Agriculture at Cornell University, may be of interest. These elms, set as young trees twenty-two years ago, had made a very thrifty growth and had begun to crowd each other. In the spring of 1912 it was decided that each alternate tree would have to be removed or cut down. In an attempt to save them these alternate trees (five in number) were root-pruned, digging to the depth of six to eight feet, cutting off all roots, leaving a ball of earth and roots eight feet in diameter. The soil was then thrown back into the

trenches, filling up to the former level. No check of growth was apparent through the summer, and it was planned to attempt the removal of these root-pruned trees through the following winter with a ball of frozen soil as is often done with younger and smaller trees. Before this could be accomplished, however, it was found that because of the location of a new building the entire row of ten trees would have to be moved. It was then determined to call in the services of a professional tree mover. The moving of these trees was accomplished during May of last year under the direction of the Landscape Art Department of the College.

The removal of the trees which had not been rootpruned the previous season was a much more particular and delicate operation than that of the prepared trees. Since the ball had not formed it was necessary to dig the soil away from the roots, saving all the fibrous roots possible by using spading forks or blunted sticks in order not to bruise the tender roots. As the bundles of roots were exposed they were tied together and the end of the cord fastened to the tree trunk to keep them out of the way. After all the roots possible were freed from the soil the tree was attached to the moving truck and gradually tipped over onto the truck by means of four guide ropes and pulley blocks which were used both in lowering and raising the trees. The roots were covered by canvas to protect the delicate fibrous roots which might be withered by exposure. The tree was then ready to be moved to its new situation where the hole had been previously dug. The size and depth of these holes varied according to whether the tree had been root pruned or not and also on the character of the root system. The trees were lowered into the holes and as the earth was being packed around the base the bundles of roots were held so as not to be buried too deeply. Then they were carefully spread out and fine earth packed around them, covering them to a depth of about four inches.

As fast as these trees were set the soil around them was soaked with water to settle and compact the dirt around the roots; and as often as the soil appeared dry through the summer, copious waterings were given. A

\*From Tree Talk, to which we are also indebted for

illustrations.

mulch of coarse strawy manure was used through the heat of the summer to good advantage.

At the close of the season the results were as follows: The five root-pruned trees were apparently as vigorous as before; three of the unpruned trees showed the shock of removal, but held their leaves well into the fall and new buds were made for next year, while two of the latter ones due to a certain extent to the condition of the soil in which they were planted, were in bad condition and there is but small hope of saving either of them.

Even with the loss of these two trees we will have a somewhat mature quadrangle in a very short time instead of waiting for the growth of young trees.

Had the moving of these trees been started in April, better success might have been had as the trees were developing their leaves when the work was begun, and before the last trees were moved they were practically in full leaf. Root-pruning one year, or still better two years, before moving, and early spring start and an experienced foreman should insure success in the moving of large trees, and where quick effects are desired, it surely pays.

### HOW TO CARE FOR CUT FLOWERS.

Even when scarce, we do not like to be without flowers of some kind, and therefore the methods of treatment recommended for keeping the blossoms fresh and beautiful and prolonging their lives to the utmost limits should be known, writes Sara Palmer in *The Queen*.

Unless they have only just been gathered, the extreme ends of the stems should be cut off before they are put into water, the newly-cut end, having its porce and vessels open, being in a better condition to absorb the water necessary to prevent the flowers from drying and withering, especially if they are to be put into a warm room.

If the stalks are at all woody the bark should for the same reason be stripped off for some distance from the end, and all thick stems, whether woody or not, should be split across in two directions, to open them up. It is a mistake from the economic no less than from the artistic point of view to crowd too many flowers into bowl or vase, as the massing close together of the stems promotes decay and causes drooping and withering of the flower stems.

Extremes of heat and cold are bad as a rule for any cut flowers, and therefore, the daily fresh water for the flowers, especially for the more delicate blossoms, should be left in the room all night, to become of the same temperature, and so be ready when the stale water is poured away next morning, and any dead leaves picked off. It is a good plan to cut a tiny piece from the ends of the stems and wash them if they show any signs of decay each day when changing the water, but this is not necessary so often if some preservative is put into the water each time. Powdered charcoal is very good, keeping the water fresh and pure. A layer should be put at the bottom of the vase and the flower-stems stuck in it.

Other preservatives recommended are carbonate of soda, saltpetre, nitrate of soda, camphor, a little of either being dissolved in the water every time. Many florists who have to take the utmost care of fragile blossoms during the winter add about a teaspoonful of gin to each jar of cut flowers to keep them fresh.

When flowers have become withered they may often be revived by cutting the ends and plunging them immediately into absolutely boiling water. If they are not too far gone the wrinkled petals will begin to smooth out in a few minutes, and freshness be more or less restored by the time the water is cold, when the stems should be cut again, any wetted part being entirely removed, and the flowers put into fresh cold water. A little gin or carbonate of soda in the hot water often aids the freshening, especially in the case of violets, which should be plunged up to the flowers in warm water before the bunches are untied.

Generally speaking, colored flowers can be more perfectly restored than white ones, which tend to become yellow or else semi-transparent, and, as might be expected, the thicker and more "fleshy" the petals the better the chance of revival, which is possible even though the flowers have been out of water for many hours.

To prevent large blossoms, e. g., tulips, from opening too widely, thus losing some of their beauty and tending to drop quickly, a little soft tissue paper may be wrapped round each blossom at night and removed next morning. The falling may often be retarded by dropping a little gum into the centre of each flower, a device especially useful for those which are rather full blown when plucked.

## THE GARLAND FLOWER.

(Daphne Cneorum.)

It cannot be said that this sweet-scented, hardy plant is in the full sense of the word popular. In the gardens of the wealthy it usually finds a place, but from villa and moderate-sized gardens it is conspicuously absent. There is good reason for this neglect. This Daphne is not so easily pleased in the matter of soil as is the case with the generality of hardy plants. In my natural soil it will not live for any time, writes J. Cornhill in Gardening Illustrated, and I, therefore, have to make, by means of loam and some leaf-mould, a rooting medium. In spite of this, it is necessary to replant at certain intervals, as the natural staple will in time assert itself, and the Daphne, thrusting its roots deeply into the ground, gets through the prepared soil into that which is not congenial. I once planted about a score of rather small pieces, the result of dividing a couple of strong plants, in about half a load of soil which I had prepared with much care. These plants throve amazingly and were a perfect picture. I have never since had the same success, probably because I have not taken the same pains.

I am not decided as to the comparative merits of autumn and spring planting. Much probably depends on the nature of the soil, and not a little on situation. With good drainage, such as on rockwork, autumn planting would be preferable, otherwise March would be the best time. Plants put in on the level are apt to suffer in a very wet winter. There is one thing about spring planting that, should the weather be dry, with cutting winds, the bark is apt to shrivel, with the result that there is a check from which recovery is slow, or the plant dies outright. The remedy is to protect slightly—a bough from which the leaves have fallen is a good thing. In the case of those plants which did so well I top-dressed annually with a mixture of peat and leaf-mould, which causes roots to issue from the base of the stems,

### INTERNATIONAL GARDEN CLUB.

By securing the Bartow Mansion with its thirty acres of land from the city of New York, the International Garden Club has obtained a most desirable property to carry out the purposes for which the club was formed, namely: to establish and maintain a horticultural garden, which may in time compare favorably with the world re-

nowned Kew Garden in England.

The old Bartow Homstead and its grounds consisting of some thirty acres are located in Pelham Bay Park, just beyond the Zoological Garden. It it easy of access by various roads from the center of New York City. The possibilities for development along the lines outlined by the International Garden Club are unlimited. The time appears to be a most opportune one to promote the work. The interest in horticulture is growing in this country and there are no doubt a large number of people in the vicinity of New York who would avail themselves of the privileges of an institution such as is proposed.

INTERNATION M. GARDEN CLUB HOUSE, PELHAM BAY PARK, NEW YORK,

One of the aims of the club is to make it a headquarters for all garden interests. It intends to establish a complete horticultural library; another aim is to make its gardens of intrinsic value to garden lovers in the knowledge it will furnish in the cultivation of garden plants, and the general information it will impart on garden work, through educational departments to be maintained for that purpose.

Flower shows at regular intervals and a series of lectures in the club house are among the contemplated plans. The club house is to be opened to the members about

May 1.

In the treasurer's report, dated January 25, 1915, a total membership of 336 is shown. The financial report showed the organization in splendid financial condition to proceed with the work it has undertaken.

### LENTEN LECTURES ON GARDENING.

Women's interest in gardening has been so aroused, that at the first of a series of lenten lectures on "Intimate Talks of a Successful Amateur," given in a home in New York City, of spacious accommodations, the audience was

so large that more than half of those who applied were turned away, necessitating the securing of a hall for the remainder of the lectures.

The lecturer, Mrs. Herbert Spencer Harde, is an enthusiastic amateur gardener, with a country place in Massachusetts, and she is rendering her series of lectures for the benefit of the International Child Welfare League. The subjects of her talks, as she terms them, are: "A Yellow Rose Garden in the Making," "Deciduous Shrubs and Shrubbery," "Harmony in Gardens Large and Small" and "Distinction in Rose Gardens."

Mrs. Harde calls gardening "a slavery of the love of and work for flowers, but a sweet slavery," which, she says, even music does not equal. She regards gardening a better recreation than outdoor games and urges women to indulge in it as the work means youth, health and strength for a woman. Harmony in color, Mrs. Harde believes, is one of the fundamental principles of successful gardening, in which natural effects should also not be

ignored.

There are, however, some points on which we cannot agree with the lecturer, one of which is that there is no distinction between low and high grade plants—that there is no difference in value between the plant selling at a few cents and that running up in the dollars in price. Those who have grown both kinds will endorse our opinion that the difference is decided.

"It is a splendid thing to know about gardening if for nothing more than to know what one's gardener does. Think of a first-class gardener, a diploma man, doubling back the roots of a valuable rose he is going to plant instead of spreading them out!" says the lecturer. Any gardener who would commit such an act and is in possession of a diploma is in the same position as many other college men who have acquired their degree in law, theology or medicine and when they proceed to practice their calling prove themselves entirely unfitted for it. Too many of us are wont, however, to judge a profession by the shortcomings of some individuals within it;

whereas the profession does not choose for us whom we employ, but in most instances it is of our own selection.

# AMERICAN RED CROSS AT NEW YORK SPRING FLOWER SHOW.

A unique and what will probably prove to be one of the most attractive features of the New York Spring Flower Show, will be the tea garden conducted by a number of New York's prominent society women. It will be in the nature of a pergola, constructed across the entire width of one end of the Grand Central Palace. The decorative effects have been arranged by Mrs. Belmont Tiffany, Mrs. A. S. Burden and William A. Delano, and no efforts nor expense have been spared in making the tea garden the most elaborate setting, from an artistic viewpoint, that has ever been attempted for a public benefit. The garden will be in charge of different committees each day of the flower show, and the society women, assisted by the younger set, will daily serve tea while their patrons may indulge in dancing afternoons and evenings. Commercial and private growers have contributed liberally with plants and flowers for decorative purposes, and hotels and caterers will contribute the foodstuffs.

The proceeds of the benefit will go to the American Red Cross and the Non-Combatant Committees.

On Wednesday, the opening day, the New York County Chapter of the American Red Cross and the Committee of Mercy will be in charge of the tea garden.—On Thursday the garden will be in charge of the Brooklyn Chapter of the American Red Cross and the American Committee of the Secours Nationale.—The Westchester County Chapter of the American Red Cross and the American Polish Relief Committee will preside over the garden on Friday.—On Saturday the Bronx Chapter of the American Red Cross and the Belgian Relief Committee will take charge. —On Sunday the garden will be given over to the Vacation War Relief Committee and a Servian Relief Committee.—On Monday the British War Relief Committee, together with the American Hotels Committee for Refugees in Paris, will be in control.—On Tuesday the Riverdale-Spuyten Duyvil-Kingsbridge Committee of the American Red Cross and the German Relief Committee will assume charge.

### HORTICULTURE IN PITTSBURGH.

That the superintendent and foremen of the conservatories in connection with the city's Bureau of Parks are giving practically undivided attention to preparations for their respective Easter Shows, almost goes without saying. John W. Jones, of the Phipps' Conservatory, Schenley Park, who makes almost a religion of experimental work, is enthusiastically working away with his force of men in the cause of Dutch bulbs, flowering shrubs, roses, orchids, and all the various other floral beauties of the season that go to delight his thousands of guests at this season.

James Moore, of the West Park (old Allegheny), North Side, is giving special attention to the transformation of the aquatic house into a Gentlemen's Country Place, intended as a surprise for his large coterie of young school and kindergarten friends. This feature is being ingeniously fitted out with a wonderful spray fountain and the various outbuildings and "alfresco" accessories that go to make up the ideal place of its kind.

The H. J. Heinz Conservatory in the rear of "Green Lawn" the residential grounds in Penn avenue, East End, is the only private greenhouse now supporting semi-annual shows; it is also open to visitors every afternoon of the year. The main range, erected six years ago, includes nine houses, with an additional "Show House," new last year. A. A. Leach, the head gardener, is a comparatively young man, a native of Mt. Clemens, Michigan. Notable among his large and varied collection were some exceptionally fine examples of Christmas-red begonias and camellias in full bloom, and schizanthus just beginning to flower. When seen on March first Mr. Leach's fan-trained peach trees were a mass of pink, and his strawberries were nearly ready to bloom.

Both the Alexander R. Peacock and the H. C. Frick greenhouses, which formerly made special provision for the public at Easter and Thanksgiving, have of recent years abandoned this custom. David Fraser, who has presided over the Frick place for eighteen years, ships semi-weekly consignments to the New York mansion throughout the winter and spring, practically supplying its cut flowers. He has about regained his normal health, following his serious illness of the fall and early winter. Although naturally of robust physique, Mr. Fraser suffered seriously from over exertion in rowing, while spending his vacation at "Eagle Rock," the Frick's summer home at Pride's Crossing, Mass.

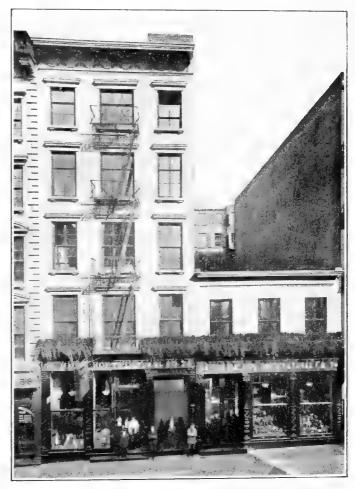

The ten acre estate of Richard Beatty Mellon—the largest and most extensive in the city—is under the man-

agement of Ernest Guter, who, prior to entering Mr. Mellon's service thirteen years ago, lived in St. Louis. Although a landscape artist was originally engaged to supervise the laying out of the present grounds three years ago, Mr. Mellon and Mr. Guter soon thereafter took complete charge and are really directly responsible for the splendid results attained. In addition to the green house range, there are cold frames, a house conservatory and an Italian garden; the garden is said to be one of the finest of its kind in the country. Mr. Guter's hobby is quality rather than quantity.

### THE MACNIFF CO.'S NEW ANNEX

The old adage "There is always room for one more in business," is exemplified by the new mammoth annex of the MacNiff Horticultural Company which has just been completed and opened to the public for its first auction sale of the Spring season on Tuesday, March 9, last.

This company, which has earned an excellent reputation for itself in the few years it has been in business, began its life in September, 1910, in the store at 62 Vesey street, where it remained until January, 1913, when it felt the need of larger quarters and leased the five-story building at 56 Vesey street, occupying all of its five floors and basement. It expected that in this building it would have sufficient space for some years to come, but it again found that the rapid growth of its seed department demanded more floor space and so it leased the plot of ground adjoining its present building and there erected a two-story structure in the nature of a large show room, the height from floor to ceiling being thirty feet, which will enable them to exhibit large specimen plants, such as Palms, Bay trees, etc., to the best advantage.

MeNIFF HORTICULTURAL CO. BUILDING AND ANNEX.

WESTCHESTER (N. Y.) AND FAIRFIELD (CONN.) HORTICULTURAL SOCIETY.

The annual entertainment and dance was held in Mechanics Hall, Stamford, Count. on Thesday evening, February 16, and was a great success. A pleasing program was rendered and heartily applauded, the members, together with their wives, ramilies and friends, including a large representation from leading seed houses and nursery firms. formed a large and jolly family party, who were welcomed by the president of the se-

ciety, W. J. Scaley.
Mis. James W. Stirling who possesses a wenderfully sweet voi.e. sang Scotch ballads and was repeatedly encored. Owen A. Hunnick sang some old-time favorites in a finished manner. Prot. Wilson, Scotch co median, in all the glory of his "Hieland" costume, delighted the audience with character songs and dances. The talented son of James Foster rendered violin solos in a very artistic manner. Prof. Melcher amused and delighted both old and young with a program of clever and mystifying feats in sleight o' hand. Various sentimental, classical, topical and popular songs were sung by the Hon. John M. Brown, mayor of Stamtord, and by Messrs, W. J. Collins James Johnston and A. L. Rickards, who were all heartily applauded.

An excellent buffet lunch was served, also a plentiful supply of fruit and candies to the little folks. The grand march was led by James Stuart and wife. James Johnston was floor manager, assisted by Alex. Clarkson. A varied dance program was provided and thoroughly enjoyed by everybody on account of the fine orchestra in attendance. This annual entertainment will long remain P. W. TOPP. a pleasant memory.

### LENOX (MASS.) HORTICULTURAL SOCIETY.

The regular monthly meeting was held on Wednesday, February 10. After a few minor changes in the schedule for the coming fall exhibition had been proposed and adopted, an interesting and instructive lecture was given by Professor J. A. Foord, of Massachusetts Agricultural College on "Some Principles of Farm Management." A well-attended meeting of members and local farmers accorded Mr. Foord a unanimous vote of thanks, who in reply invited those present to take a trip to Amherst, and so get a better insight into the work which the college was attempting. J. CARMAN,

Assistant Secretary.

### MENLO PARK (CAL.) HORTICULTURAL SOCIETY.

Thursday night, February 11, was installation night of the Menlo Park (Cal.) Horticultural Society, and brought an attendance of forty members. The following are the off-cers installed: H. L. Goertzhain, president; D. W. Slade, vice-president; P. Ellings, secretary; G. Nunn, treasurer; T. Templeton, trustee for three years; P. Copp and J. Aiken, ushers. P. Ellings, D. Bassett, J. M. Daly, G. Nunn and D. W. Slade were elected on the Exhibition Committee for the year. Mr. G. Ward was installation officer, and impressed very forcibly with witty remarks his particular duty on each officer. Refreshments were enjoyed by the members.

The society decided to hold a spring show the date to be decided later. No cash prizes will be awarded and admission to the public will be free. The society felt that it would be a big boost for the fall show, which we are striving to make the best ever held on the peninsula, as three fourths of

Mr. Lackerlin, Mr. Ward and Mr. Cruikshanks were the judges

P. ELLINGS, Secretary.

### THE HORTICULTURAL SOCIETY OF NEW YORK.

An exhibition of plants and flowers was held on Wednesday, February 17, at the American Museum of Natural History. Unusually fine displays of cut orchid blooms were made by Mr. Clement Moore and by Messrs, Lager & Hurrell. The exhibit made by Mr. Moore was very rich in Cattleya forms, one of the most interesting being a cross made and reared by himself from Cattleya Dowiana x C. Schroederae. The display of Lager & Hurrell was rich in genera and species. Much interest was added to the exhibit by the numerous displays of plants and flowers for which no premiums had been provided in the schedule. Special prizes were awarded to many of these.

A business meeting of the society took place at 3:45, followed at 4 by an illustrated lecture by Mr. W. C. McCollom on "The Small Greenhouse: Its Use and Abuse." This was of great interest, and many practical methods were described by the lecturer.

The next monthly exhibition of the society will be held on Saturday and Sunday, May 8 and 9th, at the New York Botanical Garden, Bronx Park. The usual March exhibition is omitted on account of the spring show at the Grand Central Palace. The April show is also omitted, as it would follow too closely upon the big spring show.

The following premiums were awarded at the exhibition of February 17:
Vase of schizanthus: Henry Goldman, Deal Beach, N. J., Anton Bauer, gardener. first; G. D. Barron, Rye, N. Y., Jas. Limane, gardener, second.

Vase of snapdragons: Mrs. F. A. Constable, Mamaroneck, N. Y., Jas. Stuart, gar-

dener, first.

Vase of 50 freesias, arranged for effect: Henry Goldman, first, G. D. Barron, second.

Three vases narcissus: Mrs. H. Darlington, Mamaroneck, N. Y., P. W. Popp, gardener, first.

Collection of cut orchid blooms, commercial class: Lager & Hurrell, Summit, N. J.,

Collection of cut orchid blooms, non-commercial class: Clement Moore, Hackensack. N. J., J. P. Mossman, gardener, first.

Vase of 50 roses, arranged for effect: Mrs.

F. L. Constable, first.

The following special prizes were awarded: Mrs. H. Darlington, for display of bulbous flowers, cash; Bobbink & Atkins, display of flowering shrubs, silver medal; G. D. Barron, display of cyclamens, cash; Ernest Iselin, New Rochelle, N. Y., Wm. Whitton, gardener, for display of two vases of Darwin tulips "Pride of Haarlem" and vase of Lilium formosum, cash, and cultural certificate for the lilies; Henry Goldman, for vase of stocks "Empress Augusta Victoria," cash and cultural certificate: Clement Moore, for display of new hybrid Cattleya, a cross between C. Dowiana and C. Schroederae, silver medal; Mrs. A. J. Moulton, West Orange, N. J., Arthur W. Jackson, gardener, for display of freesias and

### THE MEDFORD (MASS.) HORTICUL-TURAL SOCIETY.

At the monthly meeting of the Medford (Mass.) Horticultural Society on February 23, Wm. N. Craig of Brooklyn gave a lecture on "The preparations of soils for spring planting; how, when and what to plant. Mr. Craig spoke for about an hour, strongly condemning the slipshod manner in which farm and garden soils are quite often prepared for planting. His remarks on insects and other pests, with remedies for combating them, were especially instructive. His experience with various manures and fertilizers, in the growing of crops and dressing of lawns, was one the members of the society were greatly interested in, as they had discussed the question at previous meetings. Mr. Craig answered questions for nearly an hour after his lecture, on troubles in the garden.

GEORGE F. STEWART.

# OYSTER BAY (N. Y.) HORTICULTURAL SOCIETY,

The monthly meeting of the Oyster Bay (N. Y.) Horticultural Society was held in Fireman's Hall, Oyster Bay, on February 25. President Jos. Robinson called the meeting to order and there was a good attendance. John Sorosick reported for the entertainment committee that ladies' night was a great success. The Rev. Charles J. Canavan was elected to associate membership, and Robert S. Renison, of Westbury, an active member. The exhibition tables were loaded with cut flowers and plants, there being seventeen displays besides the many entries for the monthly prizes. James Duthie won all three of the monthly competition prizes. "For exhibition only," the awards were as follows: Jos. Robinson, one specimen azalea, C. C.; J. Ingram, one vase callas, C. C., three vases cattleyas, II. M.: A. Schoding, two lots lilium formosum, C. C., one vase annual larkspur and collection tulips, II.
M.; F. Kyle, two P. obconica, H. M.; J.
Duthie, P. malacoides improved, C. M., one cyclamen, H. M.; H. Gibson, cucumbers and one vase roses, H. M.: Chas. Mills, string beans, H. M., roses and tulips, V. T.; J. Sorosick, one vase roses, H. M. The judges were Messrs. Proctor, Humphreys and Beaton. The executive committee printed preliminary schedules for the 1915 shows, which were accepted and are now ready for distribution.

ANDREW R. KENNEDY, Secretary.

# CONNECTICUT HORTICULTURAL SOCIETY.

It was a gorgeous sight that met the eye on entering the society's room in the County Building, Hartford, as John F. Huss, of Hartford, and George B. Baker, of New Britain, staged some twenty-four fine specimen cinerarias. The cactus cineraria was particularly attractive. The judges awarded the exhibit of Mr. Huss a first class certificate, and that of Mr. Baker a cultural certificate, which was duly ratified by vote of the members.

We had with us on this occasion Maurice Fuld, of New York, who gave a most interesting and edifying talk on roses. He addressed the amateurs particularly. The meeting did not adjourn until 10:30. The next meeting, March 12, will be "Carnation" night.

\*\*ALTRLD DIXON.\*\*

Se retary.

To state the first term of this three or helically state.

If you compared the proportionate amount of cubic feet of foliage of our large trees with the usual small ones, costing few dollars, ours were always cheaper, even at the old \$60 price.

SMALL TREES

And when it comes to small trees, we have a goodly supply from 6 inches up. Fine full-vigored stock such as this soil of ours produces when combined with Hicks growing and root pruning methods.

The prices on these are just what you

### TUXEDO HORTICULTURAL SOCIETY.

The usual monthly meeting of the Tux odo Horticultural Society was held in the Paris! House on March 5, President Fred-erick Rake in the chan. There was a burge attendance of members present. Two new members were elected, George Towner and Thomas Eastham. It was left in the hands of the executive committee to make arrangements for the ladies' evening, which is to be held early in April. A paper was read on Cmysanthenums by Thos. Wilson. It was Rose and Carnation night, and a fine lot of flowers vice staged, including one vase of new car action. Also and one vase of the new carnation Champion, and exhibits of daffodils, tulips, violets and primula malacoides. The judges made awards as as follows:

Six pink roses—1st, Thos. Wilson; 2nd, David McIntosh.

Six yellow roses—1st, Thos. Wilson; 2nd, Charles Davidson.

Six red roses 1st David McIntosh: 2nd. Charles Davidson.

Six white roses—1st, David McIntosh.

Six any color roses -1st, Charles Davidson: 2nd, David McIntosh.

Twelve red carnations—1-t, David Mc-Intosh.

Twelve dark pink carnations -1st, Willram Hastings; 2nd, James MacMachan.

Twelve light pink carnations-1st, James MacMachan.

Twelve any color carnations -1st, James MacMachan.

Six white carnations-1st. Charles David-

son; 2nd, David McIntosh. Six light pink carnations-1st, Thos. Wil-

son; 2nd, Charles Davidson.

Six dark pink carnations—1st. David Me-Intosh.

Six any color carnations -1st, Charles

Davidson; 2nd, David McIntosh.

Vase of carnation "Alice"—Certificate of merit, Peter Fisher, Ellis, Mass.

Vase of carnation "Champion" - Certificate of merit, Scott Brothers, Elmsford.

Vase of daffodil Glory of Linden -Certificate of culture, Thomas Lyons.

Vase of tulip Pink Beauty Certificate of culture, Thos. Wilson.

Two primula malacoides tertificate of culture, Thos. Wilson.

THOS. WILSON, Secretary.

### NORTHAMPTON, MASS., FLORISTS' AND GARDENERS' CLUB.

The regular monthly meeting of the Holyoke and Northampton Florists' and Gardeners' Club was held in E. J. Canning's office, Prospect Heights, February 16, and was well attended, twenty-two members G. H. Sinclair and George being present. Strugnell, of Holyoke, and F. D. Keyes & Son, of Florence, exhibited some remarkably well grown cyclamen plants. F. D. Keyes & Son also exhibited a vase of that fine new dark crimson carnation. Princess Dagmar. E. H. Downer, of the Smith College Botanic Garden, exhibited some beautiful plants and sprays of flowers of Schizanthus Wisetonensis. He also exhibited some finely grown cinerarias. Each of the exhibitors was awarded a first class certificate of merit. The exhibits provoked much discussion among the members and practically every minute detail of culture was brought one.

Frank Barnard, a former active member, sent a paper which was read by Mr. Sinclair, on the history and the quantity of plants and cut flowers at the A. N. Pierson plants and cut flowers at the A. plant at Cromwell, Conn., where Mr. Barnard is now located.

The March meeting will be held at the new Sinclair greenhouse, Smith's Ferry.

# If You Think Hicks Trees Are High-Priced, This Will Show You Are Mistaken

at a transfer of the state of t

HE first limited number of anything produced, whether it be trees or automobiles, is costly. As output increases, cost decreases. This is a well understood fact. It hardly seems worth mentioning, were it not that some people have failed to apply its principle to Hirks Nuistry.

For example: Twenty years ago we started growing big trees. Those first produced logically came high. But, even as long ago as that, sold freely, because of the novelty it was to successfully move big trees and produce almost overnight, results that it had always taken ten or fifteen years to accomplish by planting the customary small trees.

So great was the lemand for these big trees that for years we had difficulty in producing them fast enough. Very naturally, as with anything else, the cost kept up proportionately.

But now, with our enlarged planting areas and improved methods of growing, we have greatly increased our output of trees and correspondingly lowered the cost of producing them.

For example, a fine big maple that it used to be necessary to ask buy of us for \$40 would expect to pay for trees of their

\$ 60 tor, you can now buy of us for \$ 40 to \$ 50

big maple that it used to be necessary to ask would expect to pay for trees of their quality. And no more.

Especially fine Rhedodendrons we have in abundance; as well as shrubs and hardy flowers in large variety.

Come and see for yourself. Pick out just what you want. If you can't come, sen't for catalcg. We can safely ship, even our big trees, 1,000 miles.

GUARANTEE

Every Hicks tree is guaranteed to live and thrive satisfactorily or cheerfully replaced. Note that word cheerfully. We shall expect to either hear from you or see you here.

# Isaac Hicks & Son Nursery, Westbury, L. I.

# AMERICAN ROSE SOCIETY—SPRING EXHIBITION

Sixteenth Annual Exhibition of the American Rose Society, March 18 to 21, inclusive, in conjunction with the Massachusetts Horticultural Society. The fine half of the society is the place of meeting. There promises to be some choice exhibits. Massachusetts has a local pride in this Country and local people are doing them hest to make a fine showing.

to make a fine showing.

On Thursday the 18th instant by noon time the pots and tubs will be staged, the next day, Friday, the cut blooms.

The Schedule Committee Messis, Louis J. Router, Alexander Montgomery, and Thomas Roland have done good work in fixing prices; the special prizes are liberal. The final list, except for any additional prizes, is now distributed and entry blanks are available. Secretary Rich, of the Massachusetts Horticultural Society, is giving all the aid and attention in his power to serve exhibitors.

The manager of the Rose Society's exhibits is Mr. Eber Holmes, of Montrose, Mass., and the manager of a Rose Show always has a job ahead and so far the men who have acted in this capacity have made all things satisfactory to exhibitors and the interested public. Mr. Holmes will do that.

The annual membership dues are being paid well. There is a free ticket to all members. The election of officers will be an important event, also deciding where the show shall go next year. Philadelphia has spoken for it.

BENJAMIN HAMMOND, Secretary.

# SOUTHAMPTON HORTICULTURAL SOCIETY.

The above society held its regular meeting in the Oddfellows Hall, Southampton, on March 4, when there was a good attendance of members present with the president. Mark McLoughlin, in the chair.

There were several interesting discussions on the following questions: Making of hotbeds, pruning of peach trees and best to plant; also hardy teas and hybrid tea roses and best to plant in Southampton. These informal discussions are of great benefit to the members, as is shown by the way the members take a live interest in them.

One active new member was elected, William A. Frankenbach, of the Frankenbach Nursery Co., of Southampton,

The next meeting will be held on March 18, when horticulturists visiting Southampton will be welcomed.

S. R. CANDLER. Corresponding Secretary

# \$11.75 Buys a 50 Foot Line of the SKINNER SYSTEM RAIN MACHINE

It will pay for itself the first season

WHY stand by and see your garden dry up, or else have to keep everlastingly running around with a hose, when, with a turn of a valve, you can, with one of our Complete Portable Lines, water a space 50 feet wide and 50 feet long. They cost but \$11.75. It includes everything,

except only the posts to carry it. It is equipped with quick - acting couplings, so you can quickly and easily take the entire line down and shift it to other locations.

You can give to your vegetables or flowers a gentle but thorough wetting. It makes you absolutely independent of weather con litions. Light, sandy soils can be turned into garden spots of the best.

Think what it would mean for your strawberries alone. No more drying up of the

fruit or dwindling away of the vines. You can add a third to the biggest yield you ever had, in the best year you ever had. From the results alone, you will come pretty close to getting a line on what the Skinner System Rain Machine will do for you.

If you want to put it on, say, an acre, it will cost about \$125.

Certainly that's reasonable, when you consider what it will do; and that year after year, it will keep right on doing it.

But even if you do put it on an entire acre, you will find the 50-foot Portable Line a mighty handy thing to have. So, why not order that right now, and then we can fix up the acre, or any part of it, just the same?

Send for our Bulletins and Special Complete Portable Line Circular.

is often possible to take advantage of some existing exated feature on the growds to carry the Skinner Sysm Rain Markine, so is will be practically out of  $x_k h t_i$  his pergila on one side, and the grape arbor on the her, does just that thing in this garden. tem Rain

This photo of the general con dition of a menthy lawn was taken the same day. Soil ex-actly the same as on the large lawn above. No humus was used. The grass was totally burned out in spets. The balance was brown and sorry enough looking

# For Quick, Lasting Results On Your Lawn Use ALPHANO HUMUS Dig It Around Your Shrubs Garden with It from Start to Finish

F you would have, with least care and expense, a lawn that will could those marvel us green swards of England--then use M paano Hamus treely. Spread it on the grass and rake it in the soil. Use it as an occasional top dressing throughout the season. Being in powdered form, it can quickly and easily be raked in the soil out of sight. Being odorless, you can, entirely without objection; use it at any time anywhere on your grounds. Being free from weed seeds, no such enemies are introduced. Being nature's own soil builder—no matter how heavily you spread it on, there is no danger of its burning the grass. Absorbing as it does five times its own weight in water and 14 times more than will sand, it stores up mois-ture in the soil and slowly liberates it as needed. In addition, then, to its plant-food values and soil-building properties, it acts as a dry weather protection. This Al phano Humus is the remains of countless years of vegetable and animal life, found in rich deposits at Alphano, N. J. It is practically pure Humus. We concentrate it. further increase its immediately available plant-food value, and pulverize it ready for use. In this ready for use form, its analysis equals both in plant-food values and the properties of giving long enduring fertility to soils that of the humus in the richest soils of our western prairies or the famed black alluvial soils of Russia.

We have too booklets on this Humus subject, either or both of which you are welcome to. The Humus Book tells of Humus in general and Alphano Humus in particular. The Convincement Book is a collection of evidence of what Alphano Humus has done and therefore what is with the state of the s and, therefore, what it will do. If desired, our soil experts will analyze your soil for you and make suggestions for its handling.

# PROTECT PLANT LIFE

from insect pests and the various fungi with which it is afflicted as it is to properly fertilize it. The importance of this to successful cultivation is becoming more and more evident as more is learned about the growth and habits of vegetation.

a concentrated liquid spraying material, readily soluble in water, is used at various strengths, according to directions on cans.

Aphine is equally effective in the house and garden; free from disagreeable odors of most insecticides, and practical for professional and amateur growers.

It is effective against green, black and white fly, red spider, thrips, mealy bug, soft scale, rose, cabbage and currant slugs, and other soft bodied and sap-sucking insects. It can be applied to the tenderest foliage, flowers, fruits and vegetables.

Aphine will keep your plants (sweet pea vines, rose bushes,

etc., etc.) in the garden free from insects.

Aphine is used by prominent growers as a wash for decorative stock.

Gill, 25c.; half pint, 40c.; pint, 65c.; quart, \$1.00; gallon, \$2.50.

# **SCALINE**

is an oil and sulphur composition—three in one, a scalicide, insecticide, and fungicide combined, composed of a high grade of petroleum, and the properties of the well known

fungicide, Fungine. It is a most efficient winter spraying material for San Jose and other scale.

Use one part Scaline to twenty parts water.

As a summer spray for hardy trees, shrubs and plants it is an effective remedy against green, black and white fly, red spider, thrips, woolly aphis, cottony maple scale, tulip scale, mealy bug, and all soft scale. Use one part Scaline to forty to fifty parts water.

The sulphur contained in Scaline makes it an excellent preventive against various fungi at all

seasons of the year.

Scaline will rid your evergreens and shrubs of the red spider pest, which has done so much

havoc to them recently.

For summer spraying, Scaline is recognized as a marked improvement over the old-fashioned kerosene emulsion; more effective and more economical. It mixes readily with water, contains no sediment, and can be applied with the finest spray nozzle.

Quart, 75c.; gallon, \$1.50; 10 gallons, \$10.00.

# **FUNGINE**

is a concentrated sulphur composition, used as a spraying material, readily soluble in water, containing no sediment, and, unlike Bordeaux mixture, and lime and sulphur, does

not stain the foliage, but cleanses it.

It is an infallible remedy for mildew, rust and wilt, affecting flowers, fruits and vegetables, and is used with much success by leading growers on young stock as a preventive against various blights; also against bench fungi.

One gallon makes 50 gallons spraying material.

Half pint, 30c.; pint, 50c.; quart, 75c.; gallon, \$2.00.

# VERMINE

is a soil sterilizer and vermicide. Destroys cut, wire, eel and grub worms, maggots, root lice and ants. Used one part to four hundred parts water, thoroughly soaking the

ground, it will protect your plants and lawns against ravages under the soil.

Gill, 25c.; half pint, 40c.; pints, 65c.; quart, \$1.00; gallon, \$3.00.

These products have the endorsement of leading commercial and private growers, and are generally recognized as standard remedies for the control of the insects and plant diseases for which they are recommended.

For sale by the leading seedsmen throughout the country. If not obtainable in your community, send us your order direct and we will have it shipped to you from our nearest agency.

# STAIGREEN LAWN SEED

It you are doing new seeding or renovating the old Lawn, it will pay you to use only the best.

# 25-Pound versus 14-Pound LAWN SEED

Many low-price Grass Seed mixtures weigh only 14 pounds per bushel. This indicates either a good proportion of chaff or some of the real good varieties in the rough state, not properly cleansed so as to leave only the vital part and less of the chaff or shell. In other words, so many less seeds to the quart or pound that will germinate and grow real grass.

# Why Not Buy the Re-cleaned Kind?

A mixture of grasses weighing 25 pounds per bushel of high germination and purity, perma neut in nature, the varieties carefully proportioned so that they will succeed one another in brightness of foliage, with the result that the lawn, even in its first year, will have a bright, tich green color from early spring until covered by snow.

No. 4.

# The International Flower Show of 1915

The third international flower show, more properly called the New York Spring Flower Show, held in the New Grand Central Palace, New York City, March 17-23, judged from every viewpoint was a success. Chairman Frank R. Pierson, Secretary John Young and the other members of the show committee, and Arthur Herrington, the exhibition manager, are to be congratulated on the favorable outcome of their united efforts. To these gentlemen, to the guarantors of the show, to the donors of cup and cash prizes, to the board of jurors, furthermore to the trade exhibitors, and lastly, but by no means in the least degree to the private and commercial plant and

flower growers, who exhibited their products, the thanks of the florist craft, and of flower and plant lovers in general are extended.

Many of the large commercial growers and some of the private growers, whose exhibits at the former shows were numerous were not in the arena to contend for the prizes this year, but on the other hand new exhibitors appeared. It is well that these flower shows have so soon reached such a magnitude that their success is not

THE TEA GARDEN OF THE AMERICAN RED CROSS SOCIETY, WHICH WAS INSTRU-MENTAL IN MAKING THE INTERNATIONAL FLOWER SHOW NEW YORK'S SOCIETY EVENT OF THE SEASON.

endangered by the failure of a considerable number of growers to participate every year. No doubt these growers, the absence of whose exhibits was noted with regret this spring, will again be contestants at future spring shows. We cannot help but think that dependence upon a large, even if changing number of exhibitors puts these flower shows upon a safer basis than reliance upon a few private and commercial growers, however distinguished they may be, for the greater the number of the exhibitors that participate the more widespread must become the interest towards the show, and with proper interest manifested the success of a show is assured.

THE RED CROSS TEA GARDEN.

The tea garden of the American Red Cross Society, beautifully and artistically decorated and furnished and conducted by the several New York Chapters of this Society, was the most distinctive and praiseworthy new feature of this year's show. This innovation, humanitarian in its aim, was a social and financial success. Undoubtedly it drew many to the general show, who, had it not been for this Tea Room, would not have attended.

ANALYTICAL SUMMARY OF THE SHOW.

A brief, and by no means exhaustive summary of the exhibits, with mention in connecnection with these of the successful exhibitors, may be of interest to those who could not attend the show or made only a hasty visit, and also in a general way as a matter of record for future refer-

DEPARTMENT OF PARKS.

The Park Department of the Borough of Manhattan staged this year a large, noncompetitive group

which from the variety and excellence of material and pleasing arrangement attracted much attention, and elicited much admiration throughout the show period. The center of the group was occupied by Specimen Palms, surrounded by blooming plants of Azalea indica, amoena and mollis, which in turn were surrounded by Spiraeas and Cinerarias, interspersed with Pandanus Veitchii, with Genistas occupying one corner and the whole group edged with pans of blooming Tulips, and Hyacinths. There was also at each corner a rare, large Fern, and at the sides some fine blooming specimens of Jasmi-

num primulinum and an unusually large specimen of Euphorbia splendens. This group well deserved the gold medal bestowed upon it by the judges.

### PRIVATE GROWER EXHIBITS.

The private growers may speak with just pride of the fact that their exhibits made up more than half of the show. They contended in nearly all the classes open to them in the schedule, with the exception of the potted rose, Erica, Boronia and Hydrangea classes in which they made a very weak showing.

### PLANTS IN FLOWER.

Most noteworthy in this section were the Acadias shown by Percy Hicks, gardener to Bertram H. Borden, Oceanic, X. J., and a

specimen of the same by James Stuart, gardener to Mrs. F. A. Constable, Mamaroneck, N. Y.: the Amaryllis, staged by Wm. H. Duckham sup erintendent for Vals. D. Willis James, Madison, N. J., one of the most laturtitul exhibits in the entire show, and the fine group of flowering plants and bulbs by the same exhibitor, the specimen Anthurium shown by Wm. Cordes, gardener, to F. B. Burton, Newburg. N. Y., the Cineraria hybrida shown by F. Honeyman, gardener to Percy Chubb, Glen Cove, N. Y.; the Cineraria Stellata Cyclamen, Primula malacondes, and Shizambaof John (anning, gar-dener to Adolph Lewi solm, Ardsley, N. Y., the Primula and Cyclamen being esperally good; the Spiraeas of A. W. Golding, superintendent tor D. G. Reid, fivington. N. Y.: the specimen (hor izema of J. W. Smith gardener, to F. E. Lewis, Ridgefield, Conn.: the specimen Genista of J. H. Dodd, gardener to John Wanamaker, Jenkintown. Pa.; the Lilacs of P. W. Popp, gardener to Mr. H. Darlington, Mamaro neck, N. Y.; the finest specimens of any one kind of forced shrubs in the show; the very perfect specimen Marguerite Daisy of William II. Fischer, New Canaan, Conn., and the Primula ob omca a very un exhibit of F. High-man, gardener to Rulob Pulitzer, Mamass , N, Y,

OUTNIEST OF THE DEPARTMENT OF PARKS, NEW YORK CHY STAGED UNDER THE DIRECTION SUPERINTENDENT OF PARKS JOHN H. BEATTIE.

### Palms, Foliage and Miscellaneous Plants.

Conspicuous in this class were the Crotons and group of Ioliage plants of R. M. Johnston, superintendent for W. B. Thompson, Yonkers, N. Y.; the Kentia Palms of C. Weber, gardener to Mrs. J. Hood Wright, New York City, and of James Stuart: Wm. II. Duckham's group of foliage plants, and the specimen Bay trees of Rudolph Heidkamp, Riverdale, N. Y.

### FERNS.

The most noteworthy exhibits in this section were the Adiantum Farleyense of Mrs. H. McK. Twombly, Madison, N. J.: the Adiantum Cuneatum of R. M. Johnston, the rare Davallia and Goniophlebium of Charles Weber, the Stag Horn of J. W. Smith, and the Cabotium of J. H. Dodd.

#### BULBOUS PLANTS.

The classes of this section were well filled and the exhibits were one of the brightest features of the show, especially notable were the Hyacinths of William H. Duckham, and of R. Hughes, gardener to James McDonald, Flushing, L. I.; the Lilies of C. W. Knight, gardener to the Westbrook Gardens, Oakdale, N. Y.; the Narcissus and Tulips of E. Fardel, gardener to Mrs. A. M. Booth, Great Neck, L. I.; and group of yellow Callas, Elliottiana of Jos. Mills, superinterdent to George Gould; the Lily of the Valley, Narcissus and Tulips of Payne Whitney, and the Narcissus and Tulips of J. W. Everitt, gardener to John T. Pratt, Glen Cove, N. Y.

#### ORCHID PLANTS AND CUT BLOOMS.

There was a fine group shown by S. G. Milosy, superintendent for

George Schlegel, Bay Ridge, N. Y., and specimens of Cattleya Cyprideiums, etc., by the same collection of Sophro-Cattleyas, Sophro-Laelias, etc., shown by J. P. Mossman, gardener to Clement Moore, Hackensack, N. J., and fine specimen plants by the same exhibitor, and by Louis Strauss, Pay Ridge, N. Y. There were well arranged table displays of cut orchids by Arthur N. Cooley, Pittsfield, Mass, and James MacMackan, superintendent to George F. Paker, Tuxedo Park, N. Y.

#### CUT BLOOMS-ROSES.

The American Beautes and the vises of twenty-five roses of Wm. Kleinheinz, gardener to P. A. B. Widener, Ogontz, Pa.; the Milady, Itadley, Kilarney Queen, and Mrs. Aaron Ward, of W. R. Fowkes, gardener to Mrs. Howard tole, Madison, N. J.; the Sunburst of James Stuart; the white Kilarneys of Benjamin Distey, gardener to Mrs. J. H. H. gleit, Green wich, tonn., and the Mrs. George Shawyer of David S. Miller, gardener, to George G. Mason, Tuxedo Park, N. Y., were the main features of this section.

### CARNATIONS.

The classes of this section were very well filled. Most conspicuous of the exhibits were the vases of 150 blooms of William Kleinheinz and A. W. Golding, su-

perintendent to D. G. Reid, the vases of 25 blooms of Joseph Tansey, superintendent to H. M. Tilford, R. M. Johnston, Max Schneider, gardener to Peter Hauck, East Orange, N. J.; J. W. Smith, and T. L. Wall, Hartsdale, N. Y.

#### SWEET PEAS.

A. W. Golding with his display of blooms covering twenty-five square feet and collection of six varieties, and Alex. Geddes, Stamford, Conn. with his exhibit of 100 sprays were the whole show in this section.

### MISCELLANEOUS CUT FLOWERS

P. W. Popp's basket of cut flowers was one of the prettiest exhibits in this class. John Canning's yellow Antirrhinum was

very fine, and there were also excellent pink blooms of this flower shown by A. Feurnier, Gardener to H. L. Harkness, Glen Cove, N. Y., and white blooms by J. Loveless, gardener to W. E. Griswold, Lenox, Mass., and assorted blooms by T. Honeyman.

The mignonette of Robert Allen, gardener to E. C. Benedict, Greenwich, Conn.; the white stocks of W. Wynne, gardener to W. W. He roy, Stamford, Conn., and the colored blooms of this flower of Joseph Tansey, the Wallflower of Charles Ruthven, gardener to Eugene Meyer, Mt. Kisco, N. Y., and the pansey displays of A. W. Golding and John Canning were good features of this very interesting and practical section.

#### VIOLETS.

In this section only one of the two classes of which was filled the lest exhibit was the 200 blooms of Singles shown by Max Schneider.

#### TABLE DECORATIONS.

The table decorations were beyond argument one of the prettiest, most artistic and instructive teatures of the show. They were indeed as thing of beauty? and were universally admired. Competition was very close. On Trickay the silver cop of the New York Horticultural Society competed for by horels only was won by the Holland House with a de oration with Yeara pulcisens, and white Spacesweet peas, winning out against the more elaborate decorations of the Ritz-Carlton, which carried off the second proc. The followers was hattain. St. Regis and Delmonaco all control well deserved special prizes, their discretions were so tear in excellence or lessed, and execution to the winners. In the decorations of Saturday in which Sweet Peas orly were allowed, the adaptability of this flower to this

use was well demonstrated in the beautiful decorations of David Francis, gardener to Mrs. Fallantine, or Convent Station, N. J., and Thos. At hisomegardere to Mrs. Nathan State Management, N. Y. The demarks of Monday when sacked great

diversity of material and arrangement, were the most leautiful of all. That of John Canning, who used Acacia pubescens, Hillingdon Roses, and Dendrobium Wardianum, and by R. M. Johnston, with Phalaenopsis Schillerianum, Dendrobium nobile, and

ROSE SHOW ARRANGED BY A WEPERS OF WHICH WAS AWARD OF HIS POPUL

Schizanthus were exquisite winning first and second, and in very close competition with the winners were P. W. Popp, W. Brock, a idence to technic Delaceld. Tuxedo Park, N. Y., Martin J. Fitzgerald, gardener to Samuel Untermyer, Yonkers, N. Y., and Thes. Are uson.

### TRADE EXHIBITS.

These exhibits, numbering about sixty, were very diverse in character, among the largest and most attractive being the plants and cut Towe set A. N. Pierse, The land L. R. Poson Company, the bulb and spring plants of J. 10 1. H 15 latter exhibiting many new and rare varieties of Narcissi, splendidly grown tulips, especially the Darwin varieties and several magnificent plants of Lilium Formosum. Besides these there were the exhibits of the retail florists. who exemplified in their daily changed exhibits the artistic arrangement of flowers and plants houses of the several greenhouse building firms, including Hitchings & Co.; Lord & Burn ham Co.; the Metropolitan Material Co., and Wm. H. Lutton & Co.

#### CLUB AND SOCIETY QUARTERS.

The handsomely decorated and well furnished quarters of the New York Florists' Club, and the Horticultural Society of New York on the first floor were freely used by the members of this club and society, and by visitors as rest rooms, and were greatly approached

### COMMERCIAL GROWERS.

The more noteworthy exhibits in the several classes of the sections open to commercial growers were: The Erica, Epacris, Boromas and Acacias of Knight & Struck Co., New York (ity: the Azaleas, Adiantum Farleyense, Rose Garden, Climbing Pot Roses and Cut Rose Plooms of A. N. Pierson, Inc., Cromwell, Conn.; the Azaleas, Hydrangeas, Lilaes, group of flowering and Ioliage plant and of forced shrubs and herbaceous plants, Palms, Bay Trees, Lily of the Valley and Orchids of Julius Rochrs Co., Rutherford, N. J.; Rhododendrois, Iilies, Conifers, Nephrolepsis, Ferns, Rose Garden, and cut Rose Blooms of F. R. Pierson Co., Tarrytown, N. Y.; the Spiracas, Rho lo lendrois, Dracaenas, Palms, Boxwoods and Pay

ROSE GARDEN ARRANGED BY F. R. PIERSON GENERAL VIIIW OF SHOW TO SIDE AND BACKGROUND.

Trees and torced shrubs and herbaceous plants of Bobbink & Atkins, Rutherford, N. J.; the Orchids of Lager & Hurrell, Summit, N. J.; the cut Rose Blooms of Gude Brothers, Washington, D. C., and the cut Carnation Blooms of the Cottage Gardens, Queens, N. Y.

THE "GARDENERS" CHRONICLE" AT THE INTERNATIONAL FLOWER SHOW.

### LESSONS FROM THE FLOWER SHOW.

By An Observer.

Perhaps we ought to go to the flower shows with a pocketbook in our left hand and a Johnson's "Gardeners' Dictionary" in the other. There are so many subjects the names of which we want to know, and not only to know, but to learn their meaning, and to find out from what part of the world the plants come. We cannot call ourselves good gardeners, certainly not intelligent gardeners, until we have studied geographical botany, something of etymology, have dived into the history of plant genera, and know quite a bit about hybridization and crossbreeding.

Yet even if much of all this is largely unknown to us, the flower show can still be made interesting from its exhibits of cultured and artistic skill. Sometimes we find both combined in one place, one group. Take, for example, the plant combinations in the "groups for expert" staged by Mrs. Willis James through her superintendent, Wm. H. Duckham, Madison, N. J.; or of F. E. Lewis (gardener, J. W. Smith), Ridgefield, Conn.; or Mr. Adolph Lewisohn's (gardener, John Corning), Ardsley, N. Y. There were other almost equally fine group displays, as from Mrs. Darlington (gardener, P. W. Popp), Mamaroneck, N. Y., and Mrs. A. V. Booth (gardener,

E. Fardel), Great Neck, N. Y. In every one there was the stamp of quality upon the plants themselves, combined with high artistic taste. In some there was just an inclination to crowding, but can we have real richness without actual massing? Perhaps not. Of course, if the prize schedule called for a combined flower and foliage

SPRING FLOWERING GROUP STAGED BY WM. DUCKHAM, SUPERINTENDENT, D. WILLIS JAMES ESTATE, MADISON, N. J. AWARDED FIRST PRIZE.

group that would allow more freedom, but only flowering plants were wanted. The groups were all totally distinct and nothing finer could well be conceived.

As examples of cultural skill there were four things that specially impressed me, namely, the Primulas, the Easter Lilies, the group of Calla Elliottiana, and the Schizanthuses. These latter plants are in great favor now-a-days, and rightly. I remember twenty years back and more when we grew only the old Schizanthus, pinna-

SPRING FLOWERING GROUP STAGED BY J. W. SMITH, GAR-DENER TO F. E. LEWIS, RIDGEFIELD, CONN., AWARDED SECOND PRIZE.

tus and retusus. Now there are varieties in nearly every color except blue. In those days we thought a feathery looking plant in a 5-inch pot quite nice; but since the coming of the dwarfer growing, more freely branching crossbred varieties—derivatives of S. Wisetonensis, big rounded or close growing pyramidal specimens are in

favor. Wisetonensis was introduced to public notice first and most prominently by the English firm of Stuart Low & Co., but both in Germany and France others took to improving these "butterfly flowers." It was reserved for Jos. Veitch & Sons, of London, however, to startle the floricultural world about four years ago when they exhibited a collection of about a dozen varieties in quite distinct colors. Some were white, some pink, one was a

ENHIBIT OF YELLOW CALLA FILLOTTIANA, BY GEO. GOULD (JOS MILLS, SUPERINTENDENT), LAKEWOOD, N. J. AWARDED GOLD MEDAL.

rich purple plum, and there were others in carmine, cerise, orange shades and so on.

Schizanthuses are very tractable subjects, highly amenable to careful attention, and they last in bloom many weeks in a greenhouse or conservatory. Like so many other plants they quickly go past or drop their flowers if used for room decoration. Mr. Canning, I believe, raised his fine specimens from seed sown in May. 1914, and grew them on without a check. They branched freely of their own accord and were staked out as growth advanced. Naturally, to induce growth and development they were fed (or "fertilized") liberally.

The Easter lilies (formosum) from Mrs. W. Bayard Cutting, C. W. Knight, superintendent, Oakdale, L. I., were the finest that most of us have ever seen, carrying 14 to 16 flowers each, on tall stems. The beautiful yellow callas from Mr. George Gould, Jos. Mills, superintendent, Lakewood, N. J., were superlative and never drooped an inch during the whole period of the show. This betokened stems of great solidity, as indeed they had, for I felt them to see.

In regard to the primulas, both the obconica and malacoides type were so fine they could scarcely be improved upon. P. obconica is now obtainable in rich lake, glowy crimson, pink, lavender, light blue and white; and I see that in Germany a good salmon has been selected and comes 50 per cent. from seed. All plants raised from seed are apt to vary, and when a variety comes 70 to 80 per cent. true this is considered satisfactory. By and by the salmon "obconica" may come 80 per cent. true also. Primula malacoides, which might well be called the "Feathery Primrose," was introduced to our gardens only a few years ago by George Forrest, the plant collector of the Bees, Ltd., Liverpool, England. Mr. Forrest has introduced several good hardy primulas as well, and some rhododendrons among other things, and traversed parts of Tibet and highland areas south of the re-

gion that E. H. Wilson explored. Wilson is now at the Arnold Arboretum, near Boston, Mass.; and Forrest is just returning from his second or third expedition. He has had some hairbreadth escapes, and about the time of the British Expedition to Lhassa, under Col. Younghusband, he narrowly missed death at the hands of the tribesmen.

This "feathery primrose" is now giving rise to several distinct varieties, a characteristic of many plants when they come into cultivation. Among the new colors now acquired are white, rose and a sort of crimson purple. Probably some one will hybridize this primula with the scarlet flowered Cockburniana. I wonder why this latter has not been shown yet by some of our growers? The whole family of primulas is a very wonderful one, with inflorescences in a variety of forms, and in colors from blue to scarlet, pink and primrose.

Another lesson at the flower show was got from the rose gardens. The best and coziest rose gardens are naturally those set out on a geometrical plan and preferably, I think, having a pergola, and bower and screening fences as features of the composition. The two gardens there shown were quite dissimilar, that of A. N. Pierson, Inc., Cromwell, Conn., being in the form of a rustic rosary; while the F. R. Pierson Co., of Tarrytown, N. Y., planned theirs on a classical basis. Each gave as good ideas for gardens of larger extent, but instead of the white pebbles in F. R. Pierson's I would prefer something of a quiet color in material that would bind and give a smooth surface; while a fault in A. N. Pierson's exhibit, to many minds, was the presence of the small

EXHIBIT OF LILLIUM TONGILLORI M TOR SUME SUMES W. BAYARD CUTTING (C. W. KNIGHT, SUPERINTENDENT).

OAKDALE, N. Y. AWARDED FIRST PRIZE.

corner beds. Roses, when massed in good colors as they were here, are resplendent, but let us always try to have ample freedom and space all about.

How many readers of THE GARDENERS' CHRONICLE of America saw and admired Julius Rochrs Co.'s little rock garden? To me it was full of interest, recalling many, many happy days spent in collecting alpine plants in Europe and enjoying them in the gardens amid surround-

ings that make these tiny gems feel well at home. Of course here in America, with our hot spell from May until September, it becomes a difficult task to keep them in health and vigor. Many will die year by year, especially such as hail from the cool uplands, yet our own native flora furnishes a sufficient selection of bright and interesting kinds. It is to be hoped that the nurserymen and those who specialize in hardy plants will make collections of thoroughly reliable alpines and others suitable for the rock garden. No part of the garden can be made more

THE ROUK GARDLY WHICH BECAME ONE OF THE INTER-SHAG FLATURES OF THE SHOW

completely interesting, especially in the period preceding the full floraison on the herbaceous borders.

In line with the foregoing, and forming an excellent adjunct to it, is the garden of water plants. Here the

water lilies of Dreer and of Tricker, and the other aquatic and bog plans they sell, provide the material. W. Tricker (Arlington, N. J.), had at the show his delightful ever-blooming Nymphæs (water liles) in several shades. One of these is very nearly white, and another has a decided tinge of deep rosy carmine. They are invaluable also for winter flowering in a warm greenhouse in water that is warmed to a temperature of 65 degrees Fahr. Mr. Tricker is to be congratulated on having given us this ever-blooming race in blues and white.

\* \* \*

The several lots of Amaryllis on view from Madison (Mrs. Willis James' place) and from E. S. Greswold's (gardener, Arthur J. Loveless), Lenox, Mass., delighted all those who love these very handsome western South American bulbs. The story of their uprise by cross-breeding must be told another time, but cer-

tainly in the Amaryllis the flower lover has a highly satisfactory class of plants, and the price of an up-to-date collection is well repaid, for they remain always in our possession, and, if well cared for, return an ample crop of their magnificent flowers of a period of several weeks in March, April and May and compensate one for all efforts to cultivate them.

### AN AMATEUR'S IMPRESSIONS OF THE SHOW.

By Mrs. Francis King, Michigan,

Certainly the recent flower show far surpassed in beauty, interest and general attractiveness both of its predecessors. The show of 1914 I did not see, only that of 1913, and my first impression as I walked about the Grand Central Palace on Wednesday, March 17, was that of a tremendous advance in taste in the exhibits, both in color planning, arrangement of flowers and in general

design and effectiveness of exhibits. I rejoiced to see the little rose gardens. Here, thought I, we do well indeed to imitate the example of exhibitors at all London shows, where for some years now small gardens have furnished beautiful and educational features. The contrast in these rose gardens of F. R. Pierson and A. N. Pierson, Inc., was very interesting. The styles of the gardens were totally different, F. R. Pierson's a sophisticated garden, if we might so characterize it; A. N. Pierson's more naive; yet each garden in its way a perfect object lesson to the would-be rose gardener. The public's delight in these gardens was pretty to see. I heard many expressions of pleasure from visitors and indeed it was touching, too, to see the occasional wistful gaze as those who saw and rejoiced in them reflected that these were not theirs to reproduce.

The little spring garden to the left of the grand staircase on the main floor, shown by A. Lewisohn, gardener John

shown by A. Lewisohn, gardener John Canning, was a pretty sight. It recalled at once to my mind the pictures in that excellent book, "Spring Gardening at Belvoir Castle." The variety of subjects used in this exhibit was amazing. Forced heuchera, both the type and the hybrids, dicentra spectabilis, white Bud-

VIEW OF THE ORCHID DISPLAY, WITH THE ROEHR COLLECTION IN THE FRAME SEEN AT THE RIGHT.

dleias, annual gypsophila and others, showed the greatest ingenuity upon the part of the gardener. Primula malacoides alba made an enchanting "ground-work," to use an ugly English word, for Darwin tulips, daffodils and heucheras, all very delicately disposed. The whole composition was full of charming suggestion for a spring garden in the open.

In the fine exhibit of Mrs. A. Booth, gardener, on the main floor, what a pleasure to see a species tulip, Clusiana, which I have grown for many years in my own garden, but which I had never seen exhibited in this country before. Here were fritillarias, too, and scillas and muscari—all little strangers to our shows I think. The Stumpp & Walter Company showed tulip Clusiana amid a wealth of very fine bulbous flowers and the exhibits of Julius Roehrs Company of rock and spring gardens in the balcony merited great praise.

The color masses of the show were remarkable. Glorious Darwin tulips, very fine hyacinths, huge sweet peas, carnations and roses of noble size and color, made sheets of bloom along the aisles and seemed to me to be dis-

played with wonderful success.

Bobbink & Atkins' conifers made effective groups and their arrangement of spring flowering subjects, shrubs and flowers, was particularly lovely and artistic. In fact, the show as a whole was a notable one, a show calculated to foster the ever-growing American enthusiasm for fine flower growing. I congratulate all who exhibited upon their successful efforts and thank them one and all for the keen personal pleasure given me by the high beauty and perfection of their flowers.

### A PROFESSIONAL'S VIEW OF THE SHOW.

By A. B. MACGREGOR, NEW YORK.

The first impression that I gleamed on visiting the International Flower Show in New York in March was that the quality of exhibits was fully up to the standard found at the first-class shows abroad. My opinion is that the staging was a marked improvement on last year's show, which was the first I ever attended in this country, having arrived here from England during the opening day of that show and my first American act was to view an American show, of which I had heard and read much, but never witnessed before.

I was especially impressed with the spring flowering groups, the arrangement of which and color effect were superb. The rose gardens were fine and compared most favorably with those seen at the exhibits on the other side. The cut roses were the finest I have ever seen, both in size of bloom and length of stem. They were wonderful, and, I must confess, superior to those produced abroad. The crowds reminded me of the crowds usually seen at Chelsea Gardens. The orchids, while an excellent exhibit, did not compare in quantity with those seen at the big shows on the other side. The foliage plants were grand. The bulbous stock was certainly on a par with that abroad.

As to the general appearance of the entire show, I would suggest that there is some room for improvement as far as the hall is concerned. The massive white pillars stood out too prominently. If this could be relieved by a little decoration of smilax or other grasses the effect would be marked.

### OUR COVER ILLUSTRATION.

The Sign of Spring is the subject of our cover illustration. It is a reproduction of a photograph of Miss Irene Kilmer, a great lover of outdoor sports, a clever rider and driver, at Oakdale Farm, Dutchess County, N. Y., with the famous Scottish Deerhound, "Coquette," a winner of the two blue ribbons at the recent Dog Show at Madison Square Garden, New York.

### HYACINTHS FOR EARLY FORCING.

For several years past Dutch bulb-growers have been devoting a considerable amount of attention to the prep-

aration of Hyacinths for early forcing, by submitting them to treatment which will bring them into bloom at or before Christmas. The bulbs are lifted very early, before the leaves have died off, and are then kept for two or three weeks in a temperature of about 80 degs. F. The treatment varies for the different varieties; some of the early-flowering sorts are best suited by a rather lower temperature, and do not need quite so long a period of treatment; the late varieties, as a rule, require a high temperature, and a protracted stay in the hot room. In fact, each variety has to be made the subject of special study, and to be treated in exact accordance with its requirements. The kind of soil in which the bulbs have been grown, the temperature in which they were growing immediately before special treatment began, the exact temperature maintained during that treatment—all these and many other details must be carefully and accurately recorded. The least inaccuracy of observation might lead to failure, which partly explains why the treatment is not yet of general application. After the expiration of the warm period the bulbs are removed to a cool place, where they remain until the end of August or beginning of September, when the bulbs are potted.—Gardeners' Chronicle (English).

### THE BOSTON SPRING FLOWER SHOW.

By W. N. CRAIG, MASSACHUSLIES.

The Boston Spring Show, held in Horticultural Hall, Boston, March 18-21, was the finest the Massachusetts Horticultural Society has ever held, the several halls being well packed with splendid exhibits. It was too bad that more space could not be had, as some plants could not be accommodated at all. The arrangement was admirable and the plants all seemed as fresh when the show closed as at the opening. Climatic conditions were perfect and the attendance a record one. The one disappointing thing was the painfully slow judging which should have been completed the first exening and the general criticism of the judges' tardiness will undoubtedly bring about a change at future shows.

As one who was privileged to see both the Boston and New York Shows it gave me much pleasure to see how successful both were. The fact that there were but a few Bostonians showing at New York and no New Yorkers showing in Boston, did not affect the shows. New York suffered more in this respect than Boston, which secured the exhibits of such noted growers as Thomas Roland and M. H. Walsh. There were some \$15,000 in premiums at New York, and one-sixth of that amount in Boston. The New York show was naturally much larger than the one in Boston, as the schedule was a much more extensive one. The Boston show was a much more pleasing picture than the Grand Central Palace show, due to the numerous massive pillars breaking up the latter so much.

The "Midway" on the mezzanine floor in New York had no duplicate in Boston where no spaces are rented. It helped the treasury no doubt, but I hope the day will come when New York can run a successful show without these side attractions, some of which were interesting and attractive, others very decidedly the reverse.

As to the quality of the exhibits: New York excelled in orchid groups, Boston in specimens such as Cattleyas and dendrobiums; Dutch bulbous plants were equally good in each city. New York had better Schizanthus and hydrangeas; Boston was far in the lead with Cyclamens and Cinerarias. New York had the best groups of flowering plants and the rose gar-

dens were unique and beautiful. Boston had much finer specimen rambler roses and Dutch garden, which outclassed any other exhibit in either city. New York had the better azaleas and rhododendrons—although these latter were much below last year's quality, but Boston was in the lead with Acacias and Ericas.

Cut roses were more numerous in New York than Boston, but the quality did not average higher. Carnations were on about a par in both cities, as were Antirrhinums. New York had more sweet peas, but they were not equal in quality to those in Boston, neither were pansies. In palms, bay trees, fine foliage plants and ferns New York held a big lead, as Boston gives no classes except to palms at the Spring show.

Table decorations such as I saw were certainly no better than at Boston; one or two retailers in New York made splendid shows; in Boston eight retailers competed for table decorations, mantles, etc.

Boston is fortunate in having its own home exhibitors, and does not need to worry much about attendance. Some day I hope New York will be able to have a splendid horticultural hall worthy of the first city of the land. Meantime she is doing splendidly, and we in Boston, which ran the first

Ararm Sumvan, Alex. McKay,

FARQUHAR'S DUTCH GARDEN AT BOSTON'S SPRING FLOWER SHOW.
AWARDED A GOLD MEDAL.

real big show and made a financial success, are glad of it. The two cities can learn from each other, and I feel sure that in 1916 each will surpass their present year's record.

But to return to the Boston show—the exhibition of the American Rose Society filled a part of one hall and helped to make the exhibition more attractive. The orchid groups of Mrs. C. G. Weld (W. C. Rust, gardener) which won first prize; F. J. Dolansky and J. T. Butterworth were splendid. Donald McKenzie (gardener to E. B. Dana) had the six best specimen orchids. For a single specimen, Henry Stewart, (gardener to Miss Cornelia Warren), led with Dendrobium nobile carrying over 800 flowers. He showed a pair of other Dendrobes of equal quality.

For the best 300 foot group of flowering and foliage plants Duncan Finlayson (gardener to Larz Anderson) beat A. M. Davenport and W. W. Edgar Company, Martin Sullivan (gardener to William Whitman) had the best pair of specimen azaleas, and Henry Stewart the best single specimen. George Page (gardener to Mrs. Frederick Ayer) won both first and second for group of acacias covering 100 feet, with a beautiful lot of plants. Duncan Finlayson and Geo. Page had the best single specimens.

The leading exhibitors of roses in pots, or tubs, were M. H. Walsh, who had a carload of big plants; F. E. Palmer, W. W. Edgar Co., Thomas Roland and Henry Stewart. The Cinerarias were of grand quality.

Prizes in the first classes were divided between Alex. McKay (gardener of E. A. Clark), William Thatcher (gardener to Mrs. J. L. Gardener), W. C. Rust and Martin Sullivan. Cyclamens made a noteworthy showing, those from E. H. Wetterlow (gardener to Mrs. Lester Leland) William Thatcher, Alex. McKay and W. C. Rust being in the lead. Henry Stewart had the best Ericas. A magnificent lot of big specimens from T. O. Hatfield (gardener to Walter Hunnick) received a silver medal.

Bulbous plants were of grand quality and competition was keen. Prizes were divided between J. L. Smith (gardener to A. W. Preston), William Thatcher, Martin Sullivan, Alex. McKay, Duncan Finlayson,

Miss M. I. Rand, H. L. Rand, J. T. Butterworth, Geo. Barton (gardener to A. F. Estabrook) and W. T. Walke. Walter Angus (gardener to A. T. Lyman) and Ernest Townsend (gardener to Miss. Lathrop Brown's howed the best Camelias.

In carnations, roses, sweet peas and violets the commercial growers had things pretty much their own way. William Sim's grand collection of sweat peas and pansies, each well merited the silver medal awarded. Thomas Roland received a silver medal for

his beautiful collection of hard wooded plants. R. & J. Farquhar for their beautiful Dutch garden with windmill, received the highest award—a gold medal.

Among the numerous miscellaneous exhibits, T. Hatfield received a silver medal for his new Dendrobium Wellesley. J. L. Smith received a silver medal for a fine specimen of Brasso Cattleya Veitchii. W. N. Craig had a fine group of hard wooded and other flowering plants, also one of Dendrobes and Odontoglossums. A grand display of Darwin tulips from Mrs. A. Brech received a bronze medal. None of these were staked, as I noted many were in New York. Staking makes them simply hideous. The table decorations had ten entries each day. There were half that number of mantel decorations. Song birds dotted about the hall with a splendid ladies' orchestra helped to make the scene a typical spring one.

#### THE LIFE OF THE TREE.

The heartwood of tree is dead wood. It serves as a support for the live sap wood and the growing top, but otherwise is useless save for lumber. So far as the life of the tree is concerned, the heart of the tree might all be removed without loss. Many hollow trees have been filled with concrete for the purpose of strength and support and are growing with vigor. The living portion of the tree is just inside the bark, and is known as the Cambium. Injury to this is serious. To kill a tree all you have to do is to "girdle" it by cutting through the bark and Cambium layer. Trees in Winter.

### SEASONABLE NOTES ON THE GARDEN.

Springtime brings with it more important duties in the garden than any other season of the year; furthermore, it is the season at which many of the things essential to the future success of the garden should be done—things which either cannot be done at all or are accomplished at a disadvantage later in the season. Too frequently the early spring days pass before it is realized that plants are growing, that seeds are sprouting, and that the proper time for starting a garden has already passed; a garden should be made before, not after, the leaves are on the trees.

Lawns.—The lawn undoubtedly should receive the first attention in the spring. After the frost is out of the ground and as soon as the lawn is in such condition that it can be comfortably walked upon, it should be thoroughly raked with an iron rake in order to remove all dead grass and other material, such as stones, sticks and leaves. Thorough raking further tends to loosen the soil, thereby rendering the latter a good growing place for grass seed, which should be applied after the raking. On established lawns, reseeding is not always necessary, though it is not a bad practice to reseed all lawns lightly whether they seem to need it or not. After the seed has been sown, the lawn should be very lightly covered with either good rich soil, prepared humus, or thoroughly decomposed cow or horse manure. The purpose of this application is obviously to cover the seed and to give it a good rich medium in which to grow. Where soil or prepared humus is used, it is desirable to add some fertilizer, such as sheep manure; but where, on the other hand, the application is one of cow or horse manure and soil, the addition of sheep manure is unnecessary. It is difficult, however, to get cow or horse manure in a sufficiently decomposed state to use as a dressing for lawns in the spring.

After the lawn has been treated as above, it should be rolled with a heavy roller, or if this is not possible it should be well tamped. The winter frosts have tended to loosen the sod and have made the surface very uneven. Raking, dressing and rolling usually suffice to again put it into good condition.

Too much stress cannot be laid upon the importance of completing this spring treatment of the lawn as early as possible—surely before the grass becomes green. The seed must germinate and the young grass plantlets must become well established early in the season in order that the heavy spring rains may not be able to dislodge them, and, furthermore, that they may be sufficiently advanced in their development to endure the hot dry weather of the early summer. Depending upon conditions, the following amounts indicate in a general way what may be necessary to bring a lawn into proper condition: Grass seed, 25-50 pounds per acre; humus, manure, or soil, 3-10 tons per acre; sheep manure, 200 pounds per acre.

Trees and Shrubbery.—All pruning of trees and shrubbery should certainly be done before the starting of the buds in the spring. Trees should be pruned of all dead limbs and water sprouts, or suckers. Dead limbs are readily distinguished from living ones by the absence in the former of a green layer directly underneath the outermost layer of bark, a condition which, at least in young shoots, can readily be ascertained by the use of the thumb nail. Water sprouts, or suckers, are the small shoots almost invariably produced on the larger limbs of trees and frequently also on the trunk near the point at which the latter emerges from the soil. All of these should be removed. Aside from these general suggestions, it is

almost impossible to give directions which will enable one unfamiliar with the general subject of pruning to properly prune a tree. Where trees have been properly cared for in the past, however, it is very seldom necessary to remove limbs over  $2\frac{1}{2}$  to 3 inches in diameter. If there is any doubt in regard to the pruning of large trees, it is desirable to call in a known expert for advice.

Shrubs, while just as amenable to good and proper care, suffer less from neglect than do trees. A general rule applicable to the pruning of shrubs is that earlyflowering shrubs are preferably pruned after blooming, and late-flowering ones in winter or early spring. Earlyblooming shrubs usually produce their flowers on wood developed the previous season, while the later-flowering ones produce them on new wood. The golden bell, or Forsythia, for instance, blooms in the very early spring on the woody growth made the previous summer. If this were pruned away in the spring all the "flower wood" would be destroyed. On the other hand, hydrangeas bloom late in the season on the ends of shoots produced that year from buds on the old wood. It is usually customary to prune hydrangeas (in the spring) back to two or three buds, as the flower crop is thereby not endangered. If good results are to be obtained from the pruning of shrubs, therefore, the time and habit of their blooming must be carefully taken into account.-Missouri Botanical Garden Bulletin.

### COELOGYNE CRISTATA.

The accompanying illustration of the beautiful specimen Coelogyne Cristata is one of a group of fifty similar specimens grown by George Jacques, head gardener on the W. G. Mather estate, one of the most attractive estates in the vicinity of Cleveland, Ohio, and widely known for the wonderful displays of flowers and fruits grown out of doors and under glass throughout the year under the direction of Mr. Jacques.

The plant was grown in a nine-inch pan, had forty-three trusses and carries two hundred and fifteen flowers when photographed.

SPECIMEN PLANT COELOGYNE CRISTATA.

# Growing Exhibition Dahlias

By P. W. Popp, New York.

June first is early enough to plant dahlias in the vicinity of New York. A dressing of cow manure should be applied to the ground in the spring, dug in, and the ground allowed to settle and warm up. Mark off the location of the rows and drive in the stakes; the stakes with square corners are preferred, as the corners offer more resistance, and are not so apt to lean over when the ground is wet, the wind blowing, and a heavy plant tied to them. Stakes are placed 3½ feet apart in the row; the rows 4 feet apart. If space is limited, early flowering asters, or other early flowering plants may be planted between the stakes; there is a great difference of opinion among dahlia growers as to the choice between the dormant tubers and the "green plants." While the "green plants" if kept growing right along without a check until planting time, undoubtedly give good results, yet it very often happens that in the rush of other work, or unfavorable

taining the tubers, the bottom side up, the drainage holes giving sufficient ventilation to prevent heating, this being a better method than storing in sand. If the sand should be moist it has a tendency to start the growth, while if the sand is dry enough to be safe, it absorbs the natural moisture of the tubers, which become weak and useless. When planting time arrives, dig holes a foot or more square and 8 inches or 9 inches deep, planning to have all the holes the same side of the stake the whole length of the row. This has a two-fold purpose, it saves damaging the tubers when cultivating between the rows, also acts as a guide for safe digging of the tubers in the fall. When the holes are all dug they are treated to a double handful of pulverized sheep manure, which is thoroughly mixed with the soil; then a large pailful or potful of water is poured in. When the ground has settled all is in readiness for planting; if tubers are planted plan to

P. W. POPP IN THIS GARDLY OF DAHLIAS. THE NEW GIANT NEWPORT SINGLES AND GERMAN CACTUS DAHLIA, "VATER RHEIN" IN TOREGROUND.

planting conditions, the pot plants do not get the necessary shift and become pot-bound, dry out a couple of times, then become hard and stunted. A stunted dahlia plant is absolutely useless, and if planted only invites disappointment and failure. For those reasons I prefer and usually plant tubers, selecting medium sized, plump clean tubers. Only one tuber is necessary, but if there is any danger of cutting too near the "eye" the second one is allowed to remain, the fresh cut is immediately dipped in a saucer of flowers of sulphur and any that sticks is allowed to remain, but the sulphur is not rubbed in; any bruises or abrasions are sprinkled with the sulphur also; this work is usually done about April 1 when the dormant clumps are removed from the cellar. Each variety is labeled and placed in flats, and stored in a cool dry cellar until wanted. If there is any danger of the tubers shrivelling, a second flat may be placed over the one con-

have the tubers 5 to 6 inches below the soil when finally levelled up, place the neck of the tuber as close as possible to the stake, cover with just enough soil to barely cover the tuber. The filling of the holes with water I consider very important, as it supplies the necessary moisture to promote quick root action, the drier covering offering less resistance to the young growth when penetrating the ground. In a few days after planting growth will start—and so does the cut worm—the black fellow with the tough hide. He is quickly taken care of by mixing a quantity of corn meal, with just enough Paris green to slightly color it a pale green; a pinch of this mixture is placed near each plant just before nightfall, when there is no danger of rain falling; a second dose is rarely needed, and the dahlia has gotten rid of the first enemy. It is always well to have a few plants in reserve, to replace cripples or fill in blank spaces. For this

10 x 5 x 3 inches deep, placing the tubers cross-cornerwise, the tip of the tuber close up to the corner to assure close planting to the stake. Ordinary potting soil is used, with the addition of a small quantity of sifted coal ashes, about 1 part ashes to 5 or 6 soil; this forms a good porous mixture to which the roots will cling when removed from the basket. These started, plants grow right along without a check. Cultivating must be done regularly to keep down the weeds, this cultivating gradually fills up the depressions in which the dahlias have been planted and in the meantime some of the tubers have developed two or more shoots; the most promising one being selected, while the others are carefully twisted off instead of being cut. A single stem plant is preferred, branches are not allowed to form nearer than 12 or 15 inches from the ground. This allows free circulation of air, freedom in cultivating, and enables one to see the slickers as they appear. Buds will sometimes appear early in July; these should be removed at once, as the blooms are usually inferior and if allowed to remain the plants generally become stunted afterwards and never fully recover until too late—the idea is to keep the plants growing. We use sheep manure alternately, with any other kind of fertilizer that promotes rapid growth; an application of potato fertilizer is very beneficial, a sprinkling of "Bon Arbor" is applied around the plants about every ten days, until about August 1. Ten days later a good dressing of air-slaked lime is applied and raked in. This corrects any acidity in the soil and also releases the latent properties in the fertilizers that have been used; in the latter part of August a sprinkling of bone meal is scattered around. This is pointed in with a spading fork, thereby breaking up the surface feeding roots, checking the rampant growth and inducing the plants to set buds. For long stems and large flowers disbudding is resorted to, removing all side growths from the branches excepting the two most promising ones next the main stem; these are allowed to remain for future blooms. When the buds are well set, an application of soot or wood ashes is applied to the ground; this keeps the foliage green and lustrous and intensifies the colors; in very dry weather the plants are watered, giving enough for a thorough soaking each time. Spraying the plants overhead at sundown after a very hot day is very beneficial. Insecticides are used as a precautionary measure throughout the growing season. Aphine is a sterling remedy for thrips and White Fly is used with regularity and applied to the underside of the leaves. Gishurst's compound and sulpho tobacco soap may also be used to good advantage. If the garden is equipped with hydrants and a force of water is available, a quick and convenient method of applying these hard substances is to use a contrivance termed the Universal soap mixer, consisting of a brass cylinder with a screw cap, fitted with a coupling attachment to fit a 34-inch tap. The chamber is filled with the soap or compound, the cap screwed on and the hose attached to the lower end of the "mixer." In cutting blooms stems are cut just above a joint, the ends of the cut stems are then split through the first joint and placed in cold water in a cool place free from draughts. When it is desired to hold the blooms for several days it is best to place the freshly cut stems an inch of their length in hot water and allowed to remain until the water has cooled and are then placed in cold water. A lump of charcoal added to the water keeps the water pure, but the use of iced water is to be discouraged as the flowers quickly droop when removed to a warm room. The exquisite colors and beautiful forms found among the newer types of dahlias are well worth all the care and attention that we can bestow on them, coming

purpose we use small fruit baskets measuring about

in at their best when nearly everything in the garden is sere and yellow. The accompanying photograph was taken October 1, 1914; over 1,500 dahlia blooms were cut during the 10 days before that date, 5 to 10 inch blooms, according to variety, on stems 2 to 5 feet long. In the immediate foreground is a block of the new Giant Newport Singles; between the center and extreme right hand corner may be seen a group of the Giant German Cactus Dahlia, "Vater Rhein." These were all 11 feet high and profusely covered with 7-inch blooms on stems  $3\frac{1}{2}$  to 5 feet long.

#### A PLEA FOR ROCK GARDENS.

By Luke O'Reilly, New Jersey.

While visiting the recent show held at the Grand Central Palace, New York, the Rock Garden exhibit attracted my special attention and I observed that it also attracted the attention of many other visitors. Rockery plantings are suited to our climatic conditions hereabouts and we should see more of them. For many years I was connected with some of the large estates in Ireland where immense rockeries are to be found on nearly all estates, some probably a hundred years old. While serving for some years on the engineer corps the opportunity came to me to visit the principal sections of England, Ireland and Scotland, and having been born on a nursery I always had the inclination to visit the herbaceous gardens and rockeries of note during my traveling. It seems to me that this is a branch of gardening that has been sally neglected in this country and which should receive more consideration as rockeries furnish one of the most pleasing phases of a garden, large or small.

It is no difficult task to construct a rockery. The old stumps about the place can be utilized together with the small boulders for foundation work. Some of the most attractive rockeries are formed after miniature mountain ranges flanked by shrubbery. Water is essential in a dry climate to produce an effective rockery and should be provided for and freely applied in dry season.

Native ferns in shaded spots of the rock garden are most attractive. Some of the most effective rockery plantings are found among the following-named alpine plants: Abronia; Campanula carpatica; Dianthus Deltoides, Dentosus, superbus; Eschscholtzia caespitosa; Gentiana acaluis; Gypsophila muralis, repens; Leptosiphon auraus; Linaria alpina; Mesembryanthemum album; Papaver alpinum; Primula Rosea; Saponaria ocymoides; Saxifraga; Sedum; Veronica.

## FAVORITE PLANTS FOR ROCKERIES.

Few genera of plants provide a larger number of species adapted for the decoration of the Rock Garden than the Harebells, or Campanulas. Among these we have great diversity of character and wide distinctions as regards height, for while some species trail so closely to the ground as scarcely to lay claim to height, there are others with flower spikes which rise to 6 or 7 feet.

Wherever rock gardens are planned alpine Campanulas have become indispensable. Campanulas are easily managed, and thrive best in a rather light and fairly rich soil.

It is a boon to the lover of alpine flowers to be able to maintain the beauty of his rock garden or simple rockery after the gents of the early spring have passed away, and, now that rock gardening is so popular, there is more need than ever to urge the claims of the later flowering subjects. One of these is Gypsophila repens, a valuable plant, which for months at a time gives an abundance of small flowers reminding one of those of its ever-popular

sister flower, G. paniculata, but borne on a prostrate instead of an erect plant.

G, repens is a valuable plant for hanging over large rockwork, making trailing growths some feet in length, above which, at the extremities of the branches, are borne clouds of small, white flowers, which may be em-

This gypsophila is easily grown on any rockwork, or even on the level, in light soil, and will thrive either in

ployed in room of those of G. paniculata.

sun or partial shade.

In almost amazing variety exists among the Sedums, or Stonecrops, and anyone owning a large collection of these useful flowers will derive much enjoyment from a study of their beauties and the numerous points of interest they reveal. They comprise plants of very different habit, some forming rosettes of Houseleek-like growth; others creeping close to the ground and covering it with a dense carpet of small leaves, smothered, when in bloom, with flowers; others, again, are of more erect growth, often with flat leaves, and crowned with heads of bloom; while another section consists of plants of trailing growth, either with flattish leaves or with thickish branches clad with pointed leaves. It is, indeed, possible to form a collection of rare beauty in many features, not the least of the charms some of these plants exhibit being the tints of the foliage or the downy atpearance caused by the down or tiny hairs on the leaves.

Sedum pilosum belongs to the class first named, with foliage arranged in rosettes like those of a Sempervivum, and covered with a fine down. Above the leaves are borne the pink flowers, which open about June and July, and combine with the foliage to form a satisfying feature

of the rock garden.

The mossy saxifrages are exceedingly numerous, and deserve a share of the attention now devoted to their allies of other sections. They present charming cushions of moss-like growth, and often of the most exquisite shades of green, sometimes charmingly tinted with red or brown at different seasons. They vary considerably in size of foliage and in color of flowers, but none are more attractive than the species with small, closely-set leaves, truly moss-like in their appearance. In autumn, winter and early spring they are generally masses of the most vivid green, and are thus beautiful at a time when the rock garden stands in need of all the attractions it can present.

This saxifrage and all its forms delight in a somewhat shady place, yet not under the drip of trees. A north, northeast or northwest exposure suits it best. In a sunny position it often suffers in dry weather, and is disfigured by brown patches appearing in the centre. In continued dry weather it appreciates a good soaking of water.—

Extracts from Gardening Magazine (English).

#### HOW TO GROW HOLLYHOCKS.

There are many who are deterred from growing these grand plants by the prevalence of the disease, or, more properly, the fungoid pest, that is likely to infest them, the same pest attacking more or less all the members of the Mallow family, of which the Hollyhocks are the most important of the garden representatives. But one may say that Hollyhocks are indispensable in the late summer and autumn, and they cannot be let go lightly. In strong soils they are nearly always healthy, a plant lasting for several years, throwing up several grand spikes and being well clothed with foliage to the ground. The difficulty arises in the lighter soils, for the Hollyhock is what gardeners call a gross feeder, rejoicing in a soil either of loam or lime, in any case rich and deep and also well matured. There can hardly be a place whose con-

ditions are worse for Hollyhocks than the present writer's garden—on a sandy upland. Here all flower-borders have to be artificially made; but where Hollyhocks are to grow it is made deeper still, the sand taken out to a depth of 3 feet and the place filled with the best stuff we can get together, with the ashes of the fire-heap plentifully admixed and some good manure from 1 foot to 18 inches down.

For flowering the same year, Hollyhock seed may be sown in heat as early as the first days of January; but it may be sown a month or six weeks later if the plants are pushed on as quickly as may be. There is a good deal in getting a strain of seed that will give the right-shaped flower. The best kind has a distinct guard petal or outer petticoat, and the rising centre is only moderately filled. In this case the color also is much enhanced by the play and transmitted glow of light and tint within and between the inner petals. All this is lost in the round, tight flower, where the light can only play upon the outer surface.

There is much beauty of tender coloring among some of the single Hollyhocks, but of these the ones that are easiest to grow and are the most generally useful are the varieties of Althaca ficifolia, the fig-like shape of the leaf accounting for the specific name. The best are those of sulphur and white colorings, which should be secured if possible, or there will probably be a preponderance of

THE UNDERGARDENEPS LODGE, TEVEDON HALL, SUFFOLK, ENGLAND,

flowers of a poor, washy, purplish pink. But if mixed seed is sown, some will be sure to be yellow and white, and seed for further use can be kept from these.—*The Garden*.

#### AN UNDERGARDENER'S LODGE

The picture accompanying these notes represents a bothy or undergardeners' lodge in one of the best of the gardens of England, that of Elvedon Hall, Suffolk. This is a thoroughly modern structure, as well fitted in its interior as it is handsome and attractive in its exterior, and furnishes accommodation for a staff of eight or nine assistants, including the foreman. Each man has his own dormitory, while there is a main mess room, a recreation room and baths. A woman is engaged to keep the rooms clean and in order, and to cook the meals, as is general in such bothies.

# Work for the Month of May

By Henry Gibson.

The planting of trees, shrubs and herbaceous perennials should be pushed ahead with all possible speed, so that they may become established before the hot weather overtakes us.

Plants that haven't got a thorough hold on the soil soon suffer from drought, which if prolonged for any length of time means the finish of many of them. True, losses may be prevented by thorough and timely watering, but at this busy season when each department on an estate demands its quota of attention, there is little time for extra care once the planting operations are completed. Where help is limited as is the case on many estates, and this year more so than ever, the gardener often finds it difficult to give much more than passing attention to many things, hence the importance of pushing ahead and doing good work at the proper time.

#### THE VEGETABLE GARDEN.

Work in this department calls for a good deal of caution during the month. Everyone plans not to be behind in planting out the tender stock, but care should be taken not to rush the season and get caught by a late frost. Ailsa Craig onions, Leeks and Globe artichokes should be planted out on the first favorable occasion, selecting if possible a cloudy day. The land for these should now be in a mellow condition if it has been previously prepared. Onions may be planted in rows eighteen inches apart and one foot between each plant. Leeks we prefer to plant in single rows in a trench and one foot between each plant. For Globe artichokes, four feet between the rows and three feet from plant to plant is a fair allowance; on soils that dry out rapidly each of these crops would be benefited by a light mulch of well decayed manure soon after planting to conserve the moisture.

## EARLY CELERY.

This crop should be put into its permanent quarters during the month. A double row in a trench is the most popular method practiced. If possible have the trenches where water is convenient; celery is a moisture-loving plant, and while it resents a sour, stagnant soil, it likes plenty of moisture about its roots.

Seed for the main winter crop of celery should be sown now. Sown with the object of transplanting once or twice before setting out permanently is more conducive to satisfactory results than when transplanting is not practiced. Transplanting checks the development of a long tap-root and encourages the growth of a system of fine fibrous rootlets which every celery grower admires.

Tomatoes, melons, egg-plants, pepper, cucumbers, etc., should all be where they can be exposed to full air night and day for a couple of weeks before being planted out. With such treatment the plants will undoubtedly lose the rich green appearance which a warm moist greenhouse gives them, but they will ultimately be the better for it, inasmuch as there will be little or no check when they are set out.

Melons and cucumbers, together with summer squash and pumpkins, should be planted on small mounds, with some manure beneath. Egg-plants and pepper require a light rich soil. A sheltered position where the sun will not fail to reach them is preferable, and a distance of two feet each way between the plants will be about right.

Tomatoes may be trained to a trellis or supported by good stakes five or six feet long driven firmly into the ground previous to planting. The rows should be at least four feet apart and three feet between the plants.

In planting out any of these plants care should be taken

that they are thoroughly watered on the morning of the planting out day. Nothing spells failure sooner than setting out a plant with a dry root-bound ball.

#### THE GREENHOUSES. (Roses.)

Generally speaking, the month of May is looked upon as the time to replant the rose-house. In preparing for another season supply of roses there are three essentials that should not be overlooked, viz.: clean bench, good soil, and strong, vigorous plants. If one has these the battle is half won, and should the results not come up to expectations with these requirements, it will be evident that it is often the culture that is at fault. Many notes and observations will have been made concerning the culture of different varieties of roses during the past year, and it is these observations reduced to practice that are the really important factors in rose growing. Personal experience and observation of the vagaries of different roses, and methods of culture are far more conducive to success than a whole book of arbitrarily written notes.

#### CARNATIONS.

The old plants are still blooming freely, and with a top dressing of some good concentrated fertilizer they will continue to be first-class blooms for some time yet. Bone-meal or a mixture of loam and sheep manure in equal parts makes a very good top dressing.

Where field culture is adopted during the summer months the young plants should be set out as soon as the weather is settled. For some time before being planted out, however, they should be well hardened off, so as to avoid any danger of giving the plants a check. Two or three weeks in a cold frame will accustom them to outside conditions. Fifteen inches apart each way is a good planting distance, insomuch as the cultivation can be run both lengthwise and crosswise, thus saving much hand weeding. Pinching the growths should be regularly and carefully attended to so as to get nice bushy plants.

In many localities indoor culture is the only method practiced, which undoubtedly tends to produce early blooms, but for growing plants that are to provide a constant supply of blooms all through the winter we believe the field culture is second to none.

# ANTIRRITATIONS FOR WINTER FLOWERING

Where these subjects are wanted to provide a supply of flowers throughout the winter the cuttings should be got into the sand about the end of the month. Make a careful selection of those that have given a good account of themselves in the past, see that the cuttings are protected from the sun, and use every effort to prevent wilting. Seedling raised at this time will prove equally as satisfactory as cutting; in fact, we think that they make more vigorous plants. As soon as they are large enough to handle they should be picked off into flats about inches apart, and subsequently potted into three-inch pots. About the first week in August they will be ready to be planted in the bench, where with good culture they will produce fine spikes of flowers from the early part of December on through the winter months.

#### STOCKS.

Stocks also provide fine material for cutting during the winter months. A batch started during the present month will come in early, and if other sowings are made at intervals of a month a continual supply can be maintained. Plenty of sand should be used in the soil when the seed is sown, as the seedlings have a tendency to damp off;

(Continued on page 201.)

# Cultural Notes on Amaryllis Hippeastrum

By John Scheepers, New York.

It is very gratifying to notice the interest that has been shown in recent years, by owners of private estates in this country, in the collecting of rare varieties of this magnificent plant, Amaryllis Hippeastrum, of which one can see such marvelous collections in European countries.

After carefully canvassing some of the few growers in this country, I find about as many different ways of handling these bulbs as there are collections existing; after studying eminent data, I have compiled a short treatise which, if followed up, will insure success to the careful grower.

Purchase the highest quality bulbs obtainable and, if you are willing to spend substantial sums, you can procure bulbs of types that will produce immediate fine results; but in case you are desirous of working up a beau-

tiful collection, and you cannot afford to invest a large amount of money, it is advisable to purchase a certain quantity of unnamed seedlings, in which sometimes one may find a very rare and unusual color. Every private place should have a small batch of these beautiful plants, discarding from year to year the common colors and saving only that which is best, adding from year to year a few unusually fine varieties, hybridizing from those.

Owners of rare varieties in Europe hold their finest colors at very high prices; in fact, one is but rarely able to induce a sale at any price; this is the reason why I consider it of great importance that we raise and improve our own varieties in this country.

After you get your bulbs, keep them dry and protect them from the frost; keep them fairly warm; plant them in pots when the frost is over, about March. Do not plant the bulbs too far into the pots (see Fig. 1) and put them, pot and all, under a good deal of earth, in other words, plunging them.

In England the pots are plunged in tan bark on the benches, and this is a very good way of growing them, but one must see to it that the tan bark is carefully levelled off, and we must also caution our friends that the tan bark in England may contain different properties than the article does in this country.

Amaryllis Hippeastrum wants to make roots over the top of the pot and likes to be placed on top of the pot.

Immediately when put into the greenhouse one should take care to give them bottom heat, having the space underneath the bench boarded up, doing so, at least, until growing has fully begun; it is still better doing so a few weeks longer.

This type flowers first and makes leaves thereafter, and they scarcely need any water until the bud has fairly come out (see Fig. 2). Then watering should take place with very slightly heated water, in order not to cool the soil.

When summer is over do not water them any more, but allow them to dry off until October.

Take the pot out, cut the leaves and make the bulb half-way bare. (See Fig. 4.)

The roots keep much longer in this way. Bring them

to their winter quarters, but do not plant the pots into the earth; better put them on boards and heat them (stove heat from above) to dry roots quickly and keep them warm (not hot) throughout the winter. When the frost is over, take them from their pots and put them in others with fresh earth; but take care not to use pots that are too large, they like a pot which they can fill in one year's growing; they must be thoroughly and firmly established.

As to forcing, one may follow the same directions, only plant them as early as possible and do not water them until the bud is fairly half way up. (Fig. 3.) Give them enough heat to grow quickly, but mind to give them fresh air (but not too cold) in order to have strong flowers and sufficiently strong stalks.

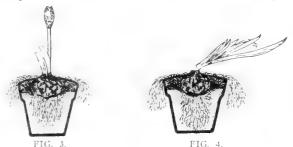

When the flowers are gone, do the same as if they were planted in March, not cutting the leaves before October, and you will have strong bulbs as the result.

Pot growing is to be preferred above open ground growing, as the bulbs are of a better substance and give more plentiful flowers.

The deciding point is this, that when grown in pots the roots are kept alive and bulbs start growing on these, while open ground bulbs always lose their roots and have to make others first, which makes a difference as to early flowering and growing, which is easy to understand.

#### HYBRIDIZING. .

Select the best varieties and cross the flowers the latter part of February, taking care only to work with those plants, which in your judgment produce the best flowers and what you consider the finest colors. Perform the pollinating on a bright sunny day, when you will usually get very large capsules of fine seeds and several hundred to a capsule. Plant the seeds on benches in rows ½ inch

apart and 2 inches between rows, in 2 inches of rich soil, about the middle of May. They germinate in about 2 weeks.

As soon as three leaves are perfected put them into three-inch pots, using soil not quite so light in texture as the seed bed, to which is added thoroughly decomposed cow manure.

In November the seedling plants are shifted into 5-inch pots.

In the spring they are again shifted into their flowering pots, six or seven inches, and grown on in a temperature of from 65 to 70 degrees. With this treatment nearly half of the bulbs will flower in 20 months.

To get a number of bulbs into flower at the same time, a good plan is to store the plants in fall, after the first flowering, under a bench in a cool greenhouse, the pots lying on their sides, and leaving them that way until the following January, when they can be placed on benches in a light greenhouse and started into growth in a tem-

# Flowers for the Hardy Garden

By Bertrand H. Farr, Pennsylvania.

The thought of a garden instantly suggests to us a place of quiet seclusion, away from the stress of the outer world, a retreat in which the cares of everyday life fade away into forgetfulness. If it is an old, old garden that comes to my mind, we picture it filled with the old-fashioned garden perennials that still flourish, though so far back as we can remember they have always existed there; and that is why the hardy plants have always appealed to me. They are permanent features of the garden, and there seems to be a sort of personality about them that makes them seem like old friends as season after season we see that they are safely tucked away for their long sleep under their snowy blanket.

With the first mild days of spring how eagerly we watch for their awakening, how it thrills us as we discover the first to appear, the dainty snowdrops, chionodoxas, and the little dwarf irises, followed in quick succession by the tulips and daffodils, their golden cups standing out in bold relief against those sluggards, the pæonies, which are just awakening and beginning to push up their long crimson stems.

Everywhere the garden teems with new life, and our perennial companions have begun another cycle of their existence which will hold us entranced again until the last of the pompons succumb to the killing November frost.

This description could be broadened to describe the average hardy garden by saying that it is made up of but little more than a dozen standard species varied by the odds and ends that each individual adds according to their own taste and fancy. The principal motifs of this cycle of the hardy garden, then, are almost entirely made up of the following:

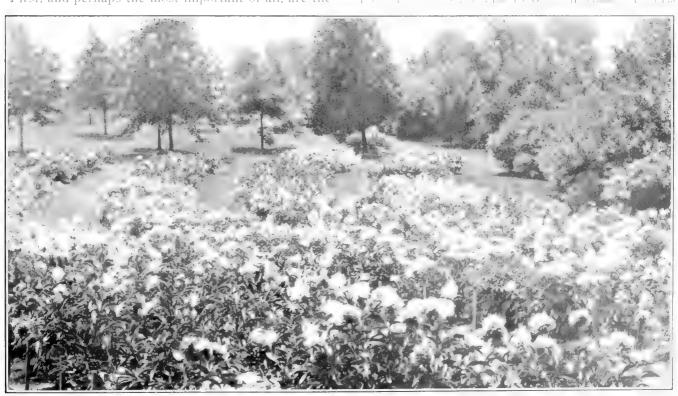

First, and perhaps the most important of all, are the

irises, the passing of which through the spring and summer months is like that of a grand procession, the first glimpse of which may be had when, in the sheltered places in February, such gems as Iris Reticulata and Sindarensis first appear. Then come the dainty Pumilas in March, followed by the various dwarf forms in April and May in ever-increasing boldness of form and color, until June ushers in the great Germanica family, the bearded irises with their broad masses of color.

In quick succession come the tall Sibericas and the still taller Spuria varieties of Aurea, Monniere, and Gigantea, until with a great burst of splendor, comes Iris Kaempferi, the crowning glory of all with its great blooms a foot in diameter, rising on tall stems to a height of five feet—the royal family, arrayed in richest blue, and purple and gold—and the pageant comes to an end, under the blazing August sun.

Again in November, the Crimean Irises, yielding to the allurements of the mild summer days, put forth their blooms here and there as if to remind us of their existence and their impatience in awaiting the coming of the spring

The charm of the iris appeals irresistibly to those whose taste for the refined and delicately beautiful leads them to seek a close acquaintance with it. The ethereal beauty of its soft irridescent coloring and its frail, orchid-like formation is likely to pass unnoticed by the casual observer. But to the enthusiast there is opened a field where he may have full scope for his wildest fancies. For there are irises for every conceivable situation, for nearly every month in the year—there being about one hundred and seventy distinct species, with the varieties running into the thousands.

AN ATTRACTIVE DISPLAY OF PAEONIES AT HIGHLAND PARK, ROCHESTER, N. Y.

While the German or Bearded Irises are still in the height of their glory, the pæonies appear, and for the time being overshadow everything else. Throughout the month of June their gorgeous blooms, rich with the warmth of their glowing colors and intoxicating in their delightful fragrance, make a universal appeal to all human interest.

Here again is a field broad enough in its scope to captivate and occupy the undivided attention of anyone who has a tendency to confine himself to some special hobby. I have been giving the pæonies my undivided attention for twelve successive Junes, and am just be-

ginning to feel that I know them.

In striking contrast to the pæonies are the stately delphiniums, with their tall spikes of bloom rising to a height of five and six feet, supplying our gardens with a wealth of blue that would be sadly lacking were it not for these magnificent plants, combining the soft azure of the forget-me-not, the rich blue of the Gentian, the sapphire and royal purples, all suffused with a beautiful rose iridescence impossible to describe. Beginning in June with the pæonies, they remain with us throughout the summer, sending up a succession of their tall spikes until the end of the season.

The golden trumpets of the Hemerocallis are an important feature of the garden at this time, forming a pleasing contrast to the blue of the Delphiniums, beginning in May with Middendorfii, through June with Florham, Gold Dust and Flava, into July with Thunbergii and Luteola, and ending with Ochroleuca and

Citrina the last of July.

Here and there standing out in bold relief against a background of shrubs the Oriental poppies flaunt their dazzling, barbaric colors, commanding instant attention and bidding defiance to everything else in the

garden.

Next to the irises and pæonies in importance are the hardy phloxes, which fill in the gap during the late summer and early autumn season, without which our garden would be bare of color. For bold color effects in large masses, they have no equal in their season of bloom, covering almost every shade from delicate white, flesh and soft pinks, through salmon, orange, and fiery scarlet, to deep blood-red and crimson dark maroon, purple and amaranthe. There are pale mauves and lilacs, soft blue and lavender, deep lavender, and the dark metallic blue of "Lord Raleigh," as seen in the morning and evening light, which changes in bright sunlight to the darkest purple.

In the autumn there are hardy asters, or Michaelmas Daisies as they are called in Europe, which along with the Golden Rod form the color scheme of our glorious American autumn, their solid sheets of blue of every shade and their rich purples contrasting harmoniously with the bright yellow sunflowers and with the golden and bronze of the Heleniums. Following these are the Anemone Japonicas, their masses of white and rose yielding at last to the first hard frost of the autumn.

Were it not for the hardy chrysanthemums, the pageant would now come to an end, but in the dull November days when every flower in the garden has succumbed to the frost, it holds full sway with a wealth of rich, Oriental colors unaffected by ordinary freezing, the shades of yellow, mahogany, bronzy red and brown, harmonizing with the autumn tints of the woodlands.

There are other things without which no hardy garden is complete: The Funkias and Trollius in early spring, primroses and Pyrethrums in May, Gaillardias and Shasta daisies which keep up a mass of bloom all summer, the Rudbeckias and Salvias and Veronicas, and hundreds of other plants which may be included,

but the main display falls upon the class of plants I have enumerated. The other plants could be dispensed with, but no hardy garden could be thought of without having a representative from the list I have given.

There are bi-ennials which are indispensable in the hardy gardens; the tall hollyhocks, foxgloves, and Canterbury Bells, but the bi-ennials are transient like the annuals which give us but a short season of bloom and die, and can never gain the same hold on us as the constant perennials that may still exist in the old garden where we spent our childhood, planted perhaps by other hands, breathing the spirit of the past into the living present.

AN EFFECTIVE PLANTING OF PALONIES ON PRIVATE GROUNDS.

I never dreamed when I first became interested in the paony to what extent my admiration would lead me. Fifteen years ago, I only knew the old-fashioned varieties, commonly seen in every garden. I thought they were beautiful and I determined to have more of them, and if possible to have a complete collection. No one could be more surprised than I to find that the list of varieties ran into the thousands, or that there existed any such wonderful creations as the varieties I now possess.

# NOTES ON AMARYLLIS HIPPEASTRUM.

(Continued from page 186.)

perature of 60 degrees. For the purpose of getting a number of these bulbs into flower, it is necessary to move them into a higher or lower temperature, according to the development of their spikes. For such purpose the plants may be grown during the summer in frames on the open ground without sash.

Do you contemplate attending the convention of the Society of American Florists and American Association of Park Superintendents or summer meeting of the National Association of Gardeners in San Francisco? If so, you should study the itinerary of an interesting trip to California in August on page 193, decide on your plans and make your reservations now.

Vol. XIX.

APRIL, 1915.

No. 4.

In commenting editorially on the success of the 1914 International Flower Show in these columns a year ago, we remarked: "We have always been firm believers that a flower show in New York City can be made as popular among society folk as the horse show is, but whenever expressing such an opinion we are usually told to 'wake up.' We are not given to prophesying, but we venture the prediction that 1915 will see our dream realized.'

The 1915 International Flower Show held in New York last month has fulfilled our prophecy, and now even those who have been most doubtful in the past of ever seeing a flower show made popular in our great cosmopolitan city are looking forward to see things accomplished a year hence that have never before been contemplated at a flower show in this country.

In the arrangement, color effect, grouping and quality of exhibits of the show just concluded, the critics were practically unanimous in their opinion that they were the finest ever produced on this side of the Atlantic. There was but one criticism heard, and that was on some of the

"trade" displays found at the show. We are sure, however, that the features objected to will be eliminated in future shows and that hereafter nothing will be tolerated among trade exhibits except genuine horticultural requisites. It must not be overlooked that an enormous monetary outlay enters into a flower show of the magnitude of the New York show and from the showman's viewpoint it is regarded as good business policy to dispose of all available space and so the fakir occasionally gets entry where he does not fit in. This happened in New York this year, but the experience has taught that the standard of exhibits for which trade space is sold must be of the very highest if they are to harmonize with the entire show, and judging by the reservations made for the 1916 flower show in New York before that of 1915 was terminated, it seems doubtful if all the legitimate trade exhibits can be provided for in another year.

The entire management of this flower show is to be congratulated on its great success, artistically, financially

and otherwise.

The personal sacrifices made by some of those of our wealthy classes to aid suffering humanity in the countries at war was daily evident at the New York Flower Show, where a tea garden was maintained for the benefit of the American Red Cross Society. The two most active workers were Mrs. Belmont Tiffany and Mrs. Wm. Kinnicutt Draper, who were to be found at the flower show morning, noon and night during its entire existence-yes, and many days before, planning and superintending the costruction of their garden—and directing the many details as chairman of their respective committees.

They were compensated, however, by the great success of their efforts, which also materially accrued to the success of the flower show. A permanent benevolence conducted annually under the auspices of these ladies in conjunction with the New York spring flower show, which has beyond all doubt become a fixed event, would prove a

valuable adjunct to it.

Attention is directed to the professional gardeners' section of the schedule of the Fourth National Flower Show, to be held in Philadelphia, under the auspices of the Society of American Florists and Ornamental Horticulturists, in March, 1916. Liberal provision has been made for the private grower and his co-operation is heartily sought at this national show. The Eastern States are to have three important spring shows next year in the following cities: Philadelphia, New York and Boston—a boon to horticulture—and it is to be hoped that the dates of the several shows will be so arranged that they may not clash with each other and will give opportunity for exhibitors to be represented at all three shows. It is none too soon to prepare for the Eastern horticultural festival of the spring of 1916.

Beginning with the May number we will establish a department which will disseminate reports and suggestions each month on the preservation of our native birds, under the direction of the Committee on Bird Protection of the National Association of Gardeners. Mr. L. P. Jensen, chairman, advises that his committee already has the assurance of co-operation from Dr. H. W. Henshaw, Chief of the U. S. Bureau of Biological Survey. The committee invites contributions to these columns from all bird lovers on their experiences on bird preservation.

# NATIONAL ASSOCIATION OF GARDENERS

JOHN W. EVERITT, President, Glen Cove, N. Y.

OFFICIAL COMMUNICATIONS

M. C. EBEL, Secretary, Madison, N. J.

The executive meeting of the trustees and directors of the National Association of Gardeners was held at the Murray Hill Hotel on Friday, March 19. The following members being present: John W. Everitt, Glen Cove, N. Y.: John F. Huss, Hartford, Conn.; William Kleinheinz, Ogontz, Pa.; James Stuart, Mamaroneck, N. Y.; Ant. Bauer, Deal Beach, N. J.; John F. Johnston, Glen Cove, N. Y.; Peter Duff, Orange, N. J.; William Turner, Bernardsville, N. J.; M. C. Ebel, Madison, N. J.

President Everitt occupied the chair. Mr. Kleinheinz, as chairman of the committee to secure private growers' exhibits for the Fourth National Flower Show to be held in Philadelphia, Pa., in March next, under the auspices of the Society of American Florists, extended an invitation to the members of the National

Association of Gardeners to participate in this show.

A motion was duly carried to accept the invitation of Mr. Kleinheinz with thanks, with the assurance that the National Association of Gardeners will co-operate in every way possible with the National Flower Show next year.

A discussion followed on the advisability of the N. A. G. providing medals which might be offered at shows when opportunity presents itself, which resulted in a motion that the association

have suitable dies made for medals.

A motion was next made to offer a silver medal at the chrysanthemum show of the American Chrysanthemum Society, to be held in Cleveland and at the special show in San Francisco this fall for the best display of six varieties, one of each variety, made by a professional gardener.

An invitation was received from the American Association of Park Superintendents to have the members of the National Association of Gardeners join the park superintendents on their trip to California in August to attend the summer meeting.

The matter of exploiting the Service Bureau on a more extensive scale to acquaint estate owners and others of its facilities was thoroughly discussed and some of the members of the board present were in favor of beginning an advertising campaign at once to accomplish the point in view. After more deliberate consideration it was deemed advisable to postpone action until the organization is in a stronger financial position as it was shown that a considerable expenditure would be required to carry out the plan to properly advertise the Service Burcau.

The Co-operative Committee reported that it would have a statement ready to issue in the next number of the official organ on the work it has done in connection with the educational course.

The meeting then adjourned to meet again at the call of the president some time during the month of July, and previous to the summer meeting to be held in San Francisco in August.

After an exhaustive effort to provide a study course on various horticultural subjects, through co-operation with one of the agricultural institutions, for members of the national association, not in position to avail themselves of a regular college course, the Co-operative Committee must report that it has not been able to approve any of the propositions placed before it, as of sufficient value to recommend them to the members. While some of the correspondent courses were found to possess considerable merit they lacked the qualifications, however, to furnish the knowledge that is not already gained through practical experience. The conclusion reached by the Co-operative Committee, as a result of its investigation, is that it will be impracticable to provide any really scientific, and at the same time practical education course, through any outside sources, which would not be entirely within the control of the national association itself. To provide this would require the services of some able instructors, which the association is not yet in a financially strong enough position to support. The Co-operative Committee will have some further recommendations to make on this subject, which it will submit to the members of the association for consideration at the next convention.

The Essay Committee has selected the following subjects for the essay competition for President Everitt's prize of \$100 in gold. The subjects have been arranged in four classes, as follows: CLASS I—Prize \$35 gold.

Subject Horticulture as a Profession, From the Standpoint of a Gardener, CLASS 2 Prize \$25 gold.

Subject—The Proper Grouping and Culture of Trees, Shrubs, Percannials and Annual Bedding Plants in the Ornamentation of Private Grounds.

CLASS 3 Prize 820 gold.

Subject-Preparation of Ground for and General Treatment of Hardy Herbacious Perennials. Naming a list of species (limited to one hundred) providing a succession of flowers throughout the entire season.

CLASS 4-Prize 820 gold.

Subject-How to Secure a Year's Vegetable Supply With the Aid of Cold Frames or Hotbeds (but no Greenhouses), Including Soil Preparation.

This essay competition is open to professional gardeners who are engaged in the capacity of superintendents, head gardeners or assistant gardeners

A competitor is entitled to enter in one class only.

The broadest latitude will be allowed in dealing with each subject.

The essays are limited to 3,000 words each.

The contest will close on October 1, the judges to report their decision at the next convention of the association, to occur the first week of December.

The Essay Committee will appoint five judges, consisting of three gardeners and two representatives of the horticultural press. Contestants will address William H. Waite, Chairman of Essay Committee, National Association of Gardeners, P. O. Box 290,

Madison, N. J., for further particulars.

These contemplating attending the summer meeting of the national association at San Francisco in August next, will be interested in the itinerary of the American Association of Park Superintendents (printed on page 193), which association has extended an invitation to the National Association of Gardeners, and the Society of American Florists, and their friends, to accompany it on its trip to San Francisco. Traveling in a body provides comfort and facilities not obtainable in traveling alone or in a small party, besides other enjoyments and good fellowship not obtainable otherwise. In addition to the invitation received from the Menlo Park, Cal., Horticultural Society, announced in the Chronicle last month, comes an invitation from L. P. Jensen, superintendent of the Busch estates, to visit the private parks of the late Adolphus Busch at Pasadena, Cal., where a royal welcome and reception is promised.

# AMONG THE GARDENERS

Frank Brunton has secured the position of head gardener to Mrs. James Brown, "Villa Vera," Locust Valley, N. Y.

Paul Dinkelacker, formerly of Cold Spring, N. Y., has secured the position as gardener in charge of the greenhouses on the George W. Perkins Estate, Riverside, N. Y., under Albert Milliard

Charles Millburn has secured the position of gardener on the A. N. White estate, Oyster Bay, N. Y.

# Of Interest to Estate Owners

The National Association of Gardeners maintains a Service Bureau which is at the disposal of all who may require the services of efficient gardeners in their various capacities.

The association seeks the co-operation of estate owners in its efforts to secure opportunities for those engaged in the profession of gardening who are seeking to advance themselves. It makes no charge for services rendered. It endeavors to supply men qualified to assume the responsibilities the position may call for.

Make your requirements known to

M. C. EBEL, Sec'y, National Association of Gardeners, Madison, N. J.

אור אורונות משמעות מווימים באור אורונים באורים 
#### BOSTON HORTICULTURAL CIRCLES.

Harry Stewart, gardener to Miss Cornelia Warren, Waltham, Mass., is an excellent plantsman whose exhibits won many prizes at the Boston Show. Ericas are particularly well grown here; there are also some splendid specimen azaleas. I doubt if there are any other grounds that can produce such magnificent plants of dendrobium nobile in a few years. Here are to be seen plants with beautiful dark green foliage and carrying 600 and 800 flowers each. The old oneidium flexuosum grows with a reckless abandon; large specimens carry 50 to 75 spikes each, and are an eyeopener to many. There is a fine maze of American arborvitae here, patterned after the one at Hampton Court Palace, England.

At the estate of Arthur T. Syman, Waltham, Mass., where Walter Angus is head gardener, a house of camellias, 85 feet long, is an interesting sight. The plants are in tubs and average from 8 to 12 feet in height. When seen early in March they carried thousands of flowers. There is a row of brick wall on this estate some 400 feet long, covered with trained peaches of all the best European varieties, one-half the length being enclosed in glass casing. These trees annually yield a big crop of handsome fruit. Some grand beds of rhododendron are on the north side of the mansion, while dotted about the grounds are grand old specimens of English elms, purple beech, white pines, etc. One of the white pines girths 18 feet.

The estate of Mrs. Samuel C. Lawrence, Medford, Mass., is always worthy of a visit, as many plants not often met with are well grown here by the skillful gardener, George F. Stewart. Dipladenias are grown to perfection here, so are clerodendrons, allamandas, rondeletias, ixoras and crotons. The glory pea of Australia-Clianthus Dampieri-was flowering beautifully. In the way of orchids, cattleyas which have been here for years, and in some cases not disturbed for half a dozen years, are in most luxuriant health. A row of C. Schroederiana hanging along the ridge of an old carnation house was the picture of perfection. The night temperature often falls to 45 degrees, little shading is given and the plants are fed freely as are other orchids. In the large store house are some grand specimen rhododendrons in tubs 10 to 12 feet high, also quantities of mammoth hydrangeas which annually carry hundreds of flower heads each. well-known Calceolaria Stewarti was raised here. Mr. Stewart now has three other colors of this type.

#### PITTSBURGH HORTICULTURAL CIRCLES.

The Garden Home Country Club, composed of residents of Ross Township, has the distinction of being the initiative or-Pennsylvania. An application for a charter was filed on the morning of March 30 in Common Pleas Court, the directors being G. F. Seif, Edward Grossman, Charles Kurt and A. G.

Although no definite steps have yet been taken, a number of the private gardeners of Pittsburgh and Sewickley Heights (numbering in all about one hundred) are agitating an organization of their own. While some are affiliated with the Florists' Club, many feel a distinct organization will be more satisfactory.

E. J. Derry, for eighteen years in the employ of Mrs. William Thaw, is the most enthusiastic of the older men for a gardeners' He supervised the building of the greenhouse, notable for its fine foliage plants, adjoining Mrs. Thaw's present home in Beechwood Boulevard in 1906, and a few years previous looked after the landscaping of her beautiful summer home "Elmhurst," at Cresson on the topmost range of the Allegheny Mountains. Nearby the town place of Mrs. Thaw is the old Mountains. Nearby the town place of Mrs. may as one of Thaw estate, "Lyndhurst," now leased to J. J. Fisher, with Neil Forsyth as head gardener. He has a range of five houses, hot Forsyth, who is a young Scotchman, received his early training at Andrew Carnegie's Skibo Castle.

In this same Point Breeze neighborhood is the Charles D. Armstrong place, which is in charge of Thomas Edward Tyler, who came from England four years ago. Mr. Armstrong is devoted to orchids, five of his seven houses being devoted to this flower. There are many calanthe in variety, and between two and three hundred hybrid cattleya, brassia, laelia, and some splendid specimens of dendrobium.

C. Philipps, who for several years had charge of the H. J. Heinz East End estate, and later of Mrs. Sarah B. Cochran's "St. James Place," at Dawson, has opened an attractive flower shop with a landscape department on the corner of Forbes and Dallas avenues, Squirrel Hill.

H. C. Frick has decided to gradually dispose of the flowers and foliage plants in his conservatories at "Clayton," his Pittsburgh home, and close the houses permanently. Until the Phipps conservatories in Schenley Park claimed the public attention, the Frick place was the shrine of the lovers of flowers and flowering plants, but the visitors have gradually dropped off. It is owing to this fact that the owner has decided to dispose of this feature of his splendid property. The estate as whole will continue under the regime of David Frazer, who has been in charge of it about eighteen years.

"Solitude," the Pittsburgh estate of the late George Westinghouse in Homewood, is now occupied by J. Gerry Curtis. He and his family are the first occupants of "Solitude" since the death of Mr. Westinghouse, the place having been closed at that time. Mr. Curtis came to Pittsburgh from Boston a few years ago as assistant chairman of the Shade Tree Commission, which was abolished last year by council. Mr. Curtis has offices in the Farmers' Bank Building, and in addition to his private work is borough forester of Sewickley, Wilkingburg and Dormont, he was recently appointed chairman of a sub-committee of the Civic Committee of Allegheny County.

Superintendent William Allen, of the Homewood Cemetery, has been appointed chairman of the Vacant Lot Committee of the Civic Committee, which is contemplating a campaign in the interest of these "eyesores" of the city during the spring and summer. To this end a luncheon will be given at the Fort Pitt Hotel next Wednesday (April 14) to interest the public. Mr. Allen is beginning to convalesce from an accident of six weeks ago, when he slipped on a step, fracturing his right ankle.

#### OBITUARIES.

Thomas Emerson, for the past 45 years head gardener to the W. B. Dinsmore family, Staatsburg, N. Y., died at his home on the 3rd inst., in his 76th year.

He served under three generations of the Dinsmore family, a

record which we believe is unbroken in this country.

Thomas Emerson was born in Thornbill, Scotland, December 25, 1839. Worked in the gardens at Blair Drummond, Eglington Castle and Rozelle, then came to this country and shortly afterwards entered the employ of W. B. Dinsmore as gardener, which position he held until his death. He was well known to the gardening fraternity, and many gardeners now holding prominent positions have passed under his tutorage.

He is survived by his widow, two daughters and two step-daughters. He was an uncle of W. E. Marshall of New York.

The friends of John B. Thomson will regret to learn of the fatal accident which occurred to him on February 19 last, the news of which came to us too late to publish in our last issue. He was kicked by a horse which resulted in his death. He leaves a widow and three small children without kin in this country, his widow's family all being located in Scotland.

The rather sudden death of Alexander Proctor, superintendent on the estate of Mrs. H. J. Burrill, Hicksville, N. Y., was a shock to the garden fraternity in which he was well and popularly known. His demise occurred on March 20. He is survived by his brother, Thomas Proctor, of Lenox, Mass.

Editor Gardeners' Chronicle:

The article entitled "Traditions of the Fathers," appearing in the last month's issue of the Gardeners' CHRONICLE deserves more thoughtful consideration than was given it by the author. I do not think that there are many of our gardeners who were brought up in the old school but are aware of the fact that a good many of the hard and soft wooded plants can be propagated from cuttings cut between joints as when cut at the base of a joint, or in other words with a heel. If this article was backed up with an experiment showing the advantage of this method in a larger percentage of cuttings, striking and stronger plants resulting therefrom, over cuttings made with a heel, it would have some value as a horticultural article.

I have read Peter Henderson's books and cannot say that he made many radical changes in the system of propagation, but he did open up the eyes of the people to the fact that there was no secret about it. It would be very interesting to have an expression of opinion through your columns from some of the progressive gardeners of today on this subject.

WM. GRAY. today on this subject.

# AMERICAN ASSOCIATION OF PARK SUPERINTENDENTS

OFFICIAL COMMUNICATIONS.

G. X. AMRHYN, Pres., New Haven, Conn.

R. W. COTTERILL, Sec.-Treas., Seattle, Washington.

#### ASSOCIATION NOTES.

President Amrhyn announces the following committees in connection with the 1915 convention to be held in San Francisco in August:

Committee on Transportation.

Herman W. Merkel (Chairman), Forester and Constructor, Zoological Park, New York City.

James B. Shea, Deputy Commissioner of Parks, Boston, Mass. John Henderson, Superintendent of Mt. Royal Park, Montreal Canada.

William S. Manning, Superintendent of Parks, Baltimore, Md. J. H. Prost, Superintendent and Forester, Special Park Commission, Chicago, Ill.

Committee on Convention.

John McLaren (Chairman), Superintendent of Parks, Golden Gate Park, San Francisco, Cal.

Roland W. Cotterill, Secretary of Park Commission, Seattle, Wash.

Theodore Wirth, Superintendent of Parks, Minneapolis, Minn. John W. Duncan, Superintendent of Parks, Spokane, Wash. H. A. Alspach, Superintendent of Parks, Sacramento, Cal.

Plans for the 1915 annual convention at San Francisco, August 18, are now well under way. The itinerary of the special train will be found elsewhere in this issue and it is to be hoped that this feature will be successful and that our members and their friends and relatives will be of sufficient number to carry it through. The special train will be a great advertisement for the association and will afford conveniences in travel which would otherwise be impossible.

Bulletin No. 12 "Concessions and Privileges in Public Parks" is just off the press and will be in the hands of the members shortly. It contains comments from twenty-five cities of over 100,000 population of their experience with these features and should be of assistance to those who are wrestling with this problem. The officers had feared that the publication of a bulletin this year would have to be omitted for financial reasons, as we are determined that there shall be no old debts turned over to the new administration; however, there will be a bulletin this year as usual.

Owing to delay on the part of correspondents there was no article last month for the series "Park Systems of Pacific Coast Cities." At this time the data is on hand from Tacoma, Los Angeles and Portland and will be published in order. These articles are intended to set forth what those who attend the San Francisco convention may see if they tour the coast by the special train.

Following the convention a series of similar articles from Middle West and Eastern cities will be published.

The secretary has on file applications from twelve capable men seeking positions in connection with park work. The financial depression of the last year or two, combined with the retrenchment spirit which has prevailed all over the country, has resulted in many competent men being displaced, with but few new openings, hence the association employment bureau has not been of much service. Should any member know of a possible opening, the secretary will be glad to supply a list of eligibles.

Someone has suggested that the president and secretary were somewhat egotistical in having full page portraits of themselves in the 1914 proceedings so we hasten to explain that these are days of economy. The editor of the Chronicle had these cuts in stock and their use saved the association the expense of having cuts made, also all other cuts used with the exception of the vice-presidents, did not cost the association a cent, being stock cuts of this magazine, which under ordinary circumstances would have been a considerable item of expense to the association.

Members who can and will prepare papers on special subjects to be read at the August convention are requested to notify the president or secretary as soon as possible. It is the intention to have more papers and discussions this year than has been the custom for a year or two and members are urged to volunteer. Select your own subject, but make it something of general interest, not a local descriptive review. Your experience or knowledge of certain phases of Park work may be invaluable to others and the purpose of our convention is the dissemination of such knowledge.

# PARK DEPARTMENT PERSONALS

John Henderson, superintendent of Mt. Royal Park, at Montreal, and one of our vice-presidents, had the misfortune to break his leg in three places on January 21 and was confined to his home for over two months as a result.

Charles A. Whittett, formerly superintendent at Lowell, Mass., has turned up at Los Angeles, Cal., and will endeavor to secure a berth in park work at one of the Pacific Coast cities.

Adam Kohankie, assistant superintendent at Denver, writes that the prospects are good for a full half-mile levy for the Denver Mountain park system, separate and distinct from the regular city levy. Those who attended the Denver convention of 1913 will never forget the tour of the wonderful mountain parks, which are an asset which no other city in the country posses. Denver will make no mistake in providing liberal appropriations for this unique feature.

Wm. R. Adams, superintendent at Omaba, Neb., writes that he is still on the job, although the commission form of government has rather upset the old order of things. Mr. Adams has rendered many years of faithful and efficient service to the city of Omaha and it is regrettable that men of his type should be handicapped by having to adjust their work to meet the ideas of politicians who have little or no experience along park lines, as is the case in a number of American cities which are working under new forms of government.

J. Howard Stine, for the past seven years director of playgrounds at Seattle, has resigned to accept a similar position at El Paso, Texas. Mr. Stine has been in charge of the Seattle playground system from its infancy to the present time when it consists of twenty-five playgrounds and four social centers, hence has had a wide range of experience which will be helpful in building up a system from the very beginning, which will be the case of El Paso. Mr. Stine's work at Seattle has been taken over by Assistant Superintendent Frank L. Fuller.

Calvin C. Laney, superintendent, and John Dunbar, assistant superintendent of Rochester, N. Y., are given very high praise for their work in a historical review of park work in Rochester published recently. The Rochester Park Board has just rounded out a quarter of a century of service, but has been legislated out of existence, being superseded by a Commissioner of Parks, under a new form of government. The change, however, will not affect Messrs. Laney and Dunbar who have been with the department since 1890 and have had much to do with making the Rochester Park system one of the best in the country.

L. H. Weir, field secretary of the Playground Association of America, known to many of our members by reason of his periodical visits to various cities, is sojourning at Albuquerque, N. M., where Mrs. Weir is taking treatment for tubercular trouble at a sanitarium in that city.

Wm. A. Gorman, formerly superintendent at Brooklyn, but temporarily out of public service, has been improving the time by inventing a lawn scarifier and tamper, on which he has received patents and has recently put the implement on the market.

It goes without saying that the device has merit, because Mr. Gorman's years of experience in park work has given him an opportunity to learn the practical essentials of an implement of this kind.

The following news item from Long Beach California is an illustration of frenzied financeering in connection with park work:

"Park Superintendent Arthur Falkenhayn is in imminent dauger of losing his job as a result of confessions made to members of the City Council that men employed as laborers in the parks were laid off for a portion of the month, but shown on the pay roll for full time, the extra money being expended for tools and equipment. Although the councilmen are satisfied that Mr. Falkenhayn did not profit personally by the peculiar financeering, they are in favor of asking for his resignation."

# ITINERARY OF CALIFORNIA TRIP OF THE AMERICAN ASSOCIATION OF PARK SUPERINTENDENTS.

En route to the respective conventions, to be held in San Francisco during the week of August 16, 1915, and return.

This is a tentative itinerary of our trip to San Francisco, and may be subject to some slight change.

We cordially extend an invitation to the members of Society of American Florists, National Association of Gardeners and local horticultural and florists clubs and societies to join our party. The railroad fare, including lower Pullman berth, will be approximately \$168. The advantages of travelling in a party are many, an important one being the comfort of your own car en-route. doing away with handling of baggage at every stop over point.

Make your reservations now with M. C. Ebel, editor of the Gardeners' Chronicle, or with the undersigned. HERMAN MERKEL,

Chairman Committee on Transportation.

Zoolo C. Park, Bronn, New York City.

Saturday August 7 Leave New York by morning train.

Sunday August 8 Arrive in Chicago 9 a, in, Sunday, August 8 Leave Chicago at 6:30 p. in,

Monday, August 9 Arrive Minneapolis 8 a. m. Full day and evening it Minneapolis. Leave by Great Northern Railroad at 10:45 p. m.

Wednesday, August II. Arrive at Glacier National Park at 8 a.m. Fill day auto tour of Glacier Park. Leave at 8 p. m.

Thursday, August 12 Arrive at Spokane 8 a. m. midnight.

Friday, August 13 Arrive Seattle, 12 noon, Saturday August 14 Leave Seattle 11 a. m. via Puget Sound steamer. Due at Tacoma 12:45 p. m. Leave Tacoma at midnight.

Sunday, August 15 Arrive Portland 7 a. m. Leave via the Southern Pacific at 3:50 p. m.

Monday August 16 Airiye San Francisco 6:50 p. m.

Monday, August 16, to Sunday, August 22 In San Francisco. Sunday, August 22-Leave San Francisco via the Southern Pacific at 7:45 a. m. Due at Del Monte 11:44 a. m. Leave in evening for Los Angeles.

Monday, August 23 - Arrive in Los Angeles 9:45 a.m. Tuesday, August 24 - At Los Angeles, While here Pasadena

may be conveniently taken as a side trip by electric train of the Pacific Electric Railway. Service every half hour, Ride consumes 30 minutes.

Wednesday, August 25 -Leave Los Angeles via the Santa Fe at 9:10 a. m. Due San Diego 1:10 p. m.

Thursday, August 26 Leave San Diego 12:50 noon via Fullerton. Due at Riverside 6 p. m. Visiting the famous "Mission Inn" and seem, the famous Magnolia avenue. Friday, August 27 Leave Riverside via the Salt Lake Route at

2:40 p. m. for Salt Lake City.

Saturday, August 28 Arrive at Salt Lake City 2 p. m. mobile sight-seeing trip may be taken through the city, returning to the Denver & Rio Grande Station and leaving at 4:50 p. m. in through cars for Colorado Springs. After leaving Salt Lake City this train passes through the beautiful Utah Valley and the most highly developed orchards in the world.

Saturday, August 28 At 6:30 a. m. (next morning) the train will pass Glenwood Springs, the queen of health resorts; thence through the Canyons of Eagle and Grand Rivers, Tennessee Pass, the Continental Pass, the Black Canyon of the Gunnison, Marshall Pass and the Royal Gorge, the mightiest chasm in the world

traversed by steel rails.

Sunday, August 29 Arrive at Colorado Springs 5:40 p. m. Monday, August 30 At Colorado Springs. While here an auto-

mobile trip may be taken to Maniton and the Garden of the Gods, or by train to Pike's Peak.

Tuesday, August 31 Leave Colorado Springs 9:25 a.m. Due at Denver 12.01 noon. Leave Denver via the Burlington Route at 9 p. m. in through cars for St. Louis.

Thursday, September 2 Arrive in St. Louis 7:19 a.m. Leave St. Louis at 11:50 p. m. for New York. Saturday, September 1 Due at New York 6:51 a. m.

#### BEST SOIL FOR VEGETABLES.

While the ideal truck soil is a mellow, well-drained loam, vegetables can be grown successfully on almost any type of soil, if the land is well prepared and supplied with a sufficient amount of available plant food. There is much advantage in having the land level or nearly so, as cultivation is more easily carried on and there is less loss of fertility through leaching and surface washing during heavy rains. The light clay-loam ridges, level sand flats, and black peaty bottoms which are found in the coast plains area of the South Atlantic states offer a variety of soil for the successful production of most vegetable crops. There are, however, areas of fine trucking land in the Piedmont and mountain sections where vegetables requiring cool, moist soil conditions can be grown more readily than they can further east and south.

It is not so much a question of soil types as it is careful preparation and thorough cultivation, that makes the growing of vegetable crops profitable. It is true that each vegetable requires cultural treatment particularly suited to its individuality, but there are some requirements that apply to the growing of almost all truck crops. An ample supply of moisture and a liberal supply of readily available plant food must be present in order to promote the rapid growth necessary to make cultivation of these crops profitable. Deep plowing, the application of plenty of humus, either in the form of stable manure or some soiling crop, and thorough tillage, will improve the physical condition and increase the amount of fertility of almost all soils. This is particularly true of clay and sandy lands. Black peaty bottom land usually contains plenty of vegetable matter. In addition to deep plowing and careful tillage, soils of this character can best be improved by draining and the application of lime. As a rule, the more care and attention given to the preparation of land for truck crops, the more easily can cultivation be carried

#### WORK FOR THE MONTH OF MAY.

(Continued from page 185.)

when they are large enough to handle they should be potted off and placed in coldframes. Pot on as required and keep them in frames until late fall. There are a number of special forcing varieties on the market, but the best we have found among these are Princess Alice and Beauty of Nice. The double ones can readily be distinguished by the stubby shape of the buds, whilst those that are single are of slender form. One authority claims that by germinating stock seed upon white blotting paper in a warm place he can select the doubles from the singles. The seeds which first put forth roots, it is claimed, produce double flowering plants.

#### CHRYSANTHEMUM.

The chief aim should be to keep these subjects as sturdy and vigorous as possible. They demand a lot of attention in the way of watering at this time. Dry winds, hot sun, small pots, and strong growth all tending to make the chrysanthemum demand a let of water. Evaporation is also rapid and a good syringing on bright days will be of great benefit to the plants.

During May is a good time to make sowings of annuals such as sweet alyssum, ageratum, lupines, delphiniums, candytuft, Shirley poppies, gypsophila, mignonette, etc. Have the soil in a good mellow condition before sowing, and when the seedlings are large enough to handle thin them out to avoid crowding.

# Tacoma and Its Parks

By George A. Hill,\* Washington.

Sir Henry Irving, a man of judgment and one who had travelled the world over, said: "Tacoma has the most beautiful situation and environment I have ever seen."

Tacoma, a beautiful city of more than 100,000 inhabitants, is on the shores of Puget Sound. It is the gateway to Mount Tacoma, the wonderful mountain of changing moods, nearly 15,000 feet in altitude, about whose feet lies Rainier National Park.

This grandest of America's mountains may easily be climbed, and its lower reaches are accessible to the poorest traveler. Starting from Tacoma, the tourist can go to a living glacier in an automobile, a trip of 70 miles. This ride is without parallel in the world. No matter where the tourist may go, nowhere else can be enter an automobile and find himself at the line of eternal snow after a ride of only four hours, over an almost perfect

that one may enjoy all this without great effort or hardship and with the greatest economy of time and expense.

Long years before Tacoma was known by any other title, it was far famed as "The City of Homes." The people of Tacoma are a home-loving and home-owning people. The life of the city is in its homes; there throbs the real heart of the city. Tacoma is proud of all those institutions which are connected with the home—schools, churches and libraries.

Puget Sound is especially favored in having long, cool summers and mild winters, which make it possible to grow a great variety of trees, shrubs and flowers, including some that are semi-tropical in their habits.

Rose culture is very popular, and beautiful hedges and heds of roses are seen everywhere, blooming the greater part of the year. English holly and many plants not grown in the East are common in Tacoma gardens.

ON THE SLOPES OF MCKINIEY PARK

road, many miles of which are paved with concrete. Mile after mile the road passes through the solitude of giant forests, the trees 6, 8 and 10 feet in diameter, their lofty heads towering 150 feet and more toward the sky. One especially thrilling part of the ride is the long ascent up the Nisqually canyon, where the road winds about a precipitous wall, while hundreds of feet below the Nisqually river roars through its rocky channel. At the entrance to Rainier National Park is a huge gateway of mammoth logs and a rustic lodge where visitors are registered.

Within a radius of 70 miles of Tacoma, nature presents a great variety of delightful and wonderful aspects. It would seem that the forces of nature had spent themselves in creating this land of magnificent mountains, glaciers, cataracts and canyons, together with the inexhaustible delights of Puget Sound, and the beauty of it all is

Superintendent of Parks, Tacoma, Wash,

Tacoma's great Stadium, built by popular subscription at a cost of \$135,000, is a unique amphitheatre with 29 miles of concrete seats, in tiers, with a comfortable seating capacity of 35,000. Theodore Roosevelt, when speaking in the Stadium in April, 1911, said: "I know of nothing like it—nothing on this side of the water and nothing abroad. In building it, Tacoma has done something that must have a marked effect upon all the other cities in the Union."

Within the City of Tacoma are 1,030 acres of public "breathing places," separated into twenty parks, ranging in size from a small triangle to one of 638 acres in area.

With the aim of keeping the parks out of the hands of politicians, the citizens of Tacoma, by vote, created the Metropolitan Park District, controlled by a board of five commissioners, one to be elected each year for a term of five years. The City Council, by ordinance, turned over all the park property to the sole control of this district,

for maintenance and improvement. The board has power to levy a tax of 1½ mills on all the property within the city limits for this purpose. This levy has brought to the district about \$100,000 per amum, and from which must come the maintenance and all improvements made in the parks.

It has been the ambition of the park commissioners to keep the district free from debt. Therefore only such improvements as could be paid for have been undertaken. This has not meant undue retrenchment, but year by year a steady advancement has been made, until Tacoma now can show parks equal, if not superior, to those of any city of its size in the country, and that without a bonded indebted-

BLACH ALPOINT DELLANCE PARK

All the small squares and triangles are plots of ground with green grass, trees, shrubs and flowers.

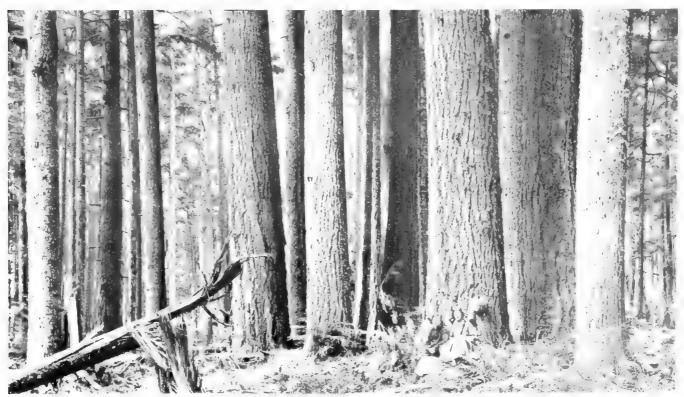

Situated between the residence and business section of the city is Wright Park, consisting of 27 acres, one of the most artistic artificial parks in any country. It is notable for the extensive variety of trees and shrubs it contains, there being 350 varieties of trees and shrubs, or about 3,000 in all, giving pleasure and profit to the lover and student of botany and dendrology. Velvety green-lawn areas interspersed by walks and drives make a beautiful landscape effect, and bring to the people who frequent it great pleasure. The conservatory in Wright Park is filled with flowers, palms and many rare plants.

McKinley, Lincoln and South, in the southern part of the city, are local parks filled with native trees and shrubs, such as fir, oak, dogwood, maple, hemlock and varieties of spirea.

No city in the country has a park so unique in situation, so varied in scenery and rich in beauty and possibilities, as Point Defiance Park. This park occupies the point of land jutting into Puget Sound north of Tacoma. It is 638 acres in extent, has about 312

miles of coast line on Puget Sound, and has an altitude of from 100 to 300 feet above tide level. The natural scenery within, and the view from the park are almost unexcelled. Within the park are many beautiful scenes, magnificent trees, fine masses of native shrubbery, flowers and ferns, forming at places an almost impenetrable wilderness.

A driveway 5 miles in length winds in and out around

GIAZI "DOUGLAS TIRS" AS SITY IN POINT DELIANCE PARI.

the edge of the park, giving beautiful vistas of the Sound and the islands beyond, but the traveler instinctively turns to the many scenes of stately trees and the ever-changing panorama around him as he travels this driveway, or he is filled with awe as he stands at the extreme point looking down 150 feet to the surging waters below, where the tides clash in the deep Narrows.

Among the many specimens of native trees in the park is the largest yew tree in the state.

At the entrance to the park about 100 acres have been improved by lawns, buildings, etc., including a very well-equipped Zoo that is worth seeing. The buffalo, elk and deer are in large pens in their natural surroundings. A small animal house cages lions, cougars, wild cats, etc., and a well-built modern pheasantry contains a fine display of rare pheasants and other birds and animals.

In the rose garden there are 66 varieties of roses in beds, containing from 12 to 24 bushes each. Each variety is plainly labeled with the name of the rose, the introducer and the date of introduction. Four large arbors covered with climbing roses of the best varieties attract universal attention.

The remainder of the park will be left in its natural beauty, but interspersed by drives and walks and picnic grounds.

A comprehensive plan of this park was made by Hare & Hare, of Kansas City, Mo., in 1911, and all improvements since have been in the direction of carrying out these plans. The plans give in detail the planting scheme, and the water, light and sewer systems, so that the superintendent can carry them out at any time when "Livin' in Tacoma, where the dreams come true, Mountain always callin' to the heart o' you; People so content-like, never want to move, Lots o' time for friendship, lot's o' time for love; Roses in December, cool and nice in June, Just the place for strollin' neath the silvery moon; Real estate a-boomin', merchants feelin' fine, No need here for kickin', fish on every line—Livin' in Tacoma, where the dreams come true, No place like Tacoma for the soul o' you."

#### MR. TOTTY GOING TO THE EXPOSITION.

Mr. and Mrs. Charles H. Hotty will leave Madison on Monday, April 26, for San Francisco. Mr. Totty has

SUPERINTENDENTS HOME AT POINT DEFIANCE PARK.

been appointed on the International Board of Jurors, at the Panama-Pacific Exposition and expects to be gone about six weeks. He has been chairman of the advisory board in the horticultural section of the exposition for the past year, and the appointment as a juror comes as a reward for his services on the advisory board.

#### HARRY A. BUNYARD CO., INC.

Harry A. Bunyard, well known in the seed trade, and commercial and private growers throughout the country, has recently embarked in business for himself under the name of Harry A. Bunyard Co., Inc. Actively associated with Mr. Bunyard is Frank A. Duggan, for many years connected with the seed trade in New York City.

The company is established in an up-to-date store at 40 West 28th street, in the wholesale cut flower district. An attractive catalogue has been issued

chairman tural section and the approximation of the properties of the provided and the approximation of the approximation

CFDAR SILMP IN WRIGHT PARK USED AS BAND STAND,

funds are available. It is our aim to complete each unit as we advance, and to do the work in a permanent way.

Spanaway Park is 8 miles south from the center of the city on a beautiful lake of the same name. It is 300 acres in extent, covered with many fine fir, maple and oak trees. No improvements have been made in this park. The ground is quite level and there is much natural beauty. It is a portion of the great 30 or 40-mile prairie adjoining Tacoma, across which the wonderful mountain road runs, and which is the paradise of the automobilist.

Ornamental Fowl for Gardens and Parks is the title of a series of articles which will begin in the May number on the breeding and habits of these fowls, the pleasure of cultivation, and aviaries suitable for the moderate garden or extensive estate.

# AMERICAN ACADEMY OF ARBORISTS.

A new organization was recently launched to place and maintain practical arboriculture and landscape forestry in this country on a high professional basis. It has long been recognized that the practice of forestry as relating to that of the general forester and that of the landscape forester or arboriculturist is quite distinct, and that the demand is constantly increasing for efficient men to take up the forestry work of parks and private estates.

To better provide this demand, the American Academy of Arborists has been organized with the following charter members: Herman W. Merkel, chief forester, New York Zoological Park, Bronx, New York City; William W. Colton, forest commissioner, West Newton, Mass.; Prof. J. W. Toumey, director, Yale University Forest School; J. J. Levison, arboriculturist, Park Department, Brooklyn, N. Y.; Harold J. Neal, city forester, Worcester, Mass.; R. B. Maxwell, city forester, Baltimore, Md.; George A. Cromie, city forester, New Haven, Conn.; James H. Walker, city forester, Newark, N. J.; H. B. Filer, city forester, Buffalo, N. Y.; A. T. Hastings, Jr., city forester, Jersey City, N. J.

The officers elected for the first year are: President, Herman W. Merkel; secretary, J. J. Levison; vice-presidents, William W. Colton, R. B. Maxwell; board of directors, James H. Walker, George A. Cromie, Harold J.

Neal.

The following constitution was adopted at the first meeting of the organization, held at the Zoological Park, Bronx, New York City, January 2, 1915:

#### CONSTITUTION.

Article 1. Name and Object.

Section 1. The name of this Association shall be the Ameri-

can Academy of Arborists.

Section 2. The object of the Academy shall be the advancement of arboriculture and landscape forestry, and the maintenance of the highest professional standard among its members.

#### Article 2. Members.

Section 1. The members of this Association shall be designated as

(a) Fellows.

(b) Honorary Members

Section 2. A Fellow shall be at the time of his admission to membership not less than twenty-five (25) years of age, and shall have been actively engaged in the practice of his profession for 10 years. Graduation from a school specializing in Arboriculture or the arts and sciences closely connected with Arboriculture shall be accepted by the Academy and credited with a proportionate number of years of active practice.

Section 3. An Honorary Member shall be a person of broadly acknowledged eminence in Arboriculture or landscape forestry, or one whose services to the objects of the Academy shall entitle

him to this position.

Section 4. Honorary Members shall not be entitled to a vote in the Academy.

# ARTICLE 3. Meetings.

Section 1. Regular meetings shall be annual meetings, and shall be held on the second Saturday of January.

Section 2. The place of meetings shall be decided by the Board of Directors

Section 3. Special meetings will be held upon the order of the Board of Directors or upon the written request of one-third of the Fellows

At any meeting a quorum shall consist of not less Section 4. than seven (7) Fellows.

#### ARTICLE 4. Officers.

Section 1. The officers of this Academy shall be a President. two Vice-Presidents and a Secretary-Treasurer, and a Board of Directors

Section 2. The terms of all offices shall be for one (1) year. Section 3. The duties of the President, Vice-Presidents, Secretary-Treasurer shall be those usually incumbent upon such

Section 4. The Board of Directors shall consist of the President (Chairman ex-officio), Vice-Presidents, Secretary-Treasurer, and three (3) Fellows of the Academy chosen by the President

The Board shall manage and conduct all business of the Academy. Section 5. The Board of Directors shall act as a Committee on Publication, compiling and editing once each year a report which shall be the official organ of the  $\Lambda$ eademy. This report

shall contain a statement of the status of the Academy, proceedings of each annual meeting, and such technical or professional articles as may be of value to the Fellows. The Secretary Treasurer of the Academy shall act as the Secretary to the Board of Directors.

#### Alther 5. Nominations and Elections

Section 1. At each annual meeting the Academy shall elect President, two (2) Vice-Presidents, a Secretary-Treasurer. Officers shall assume their duties upon receiving notice of their election, and shall hold office until their successors have been duly elected. The President shall appoint three (3) Fellows to serve with the officers as the Board of Directors.

Section 2. The officers and members of the Academy shall be elected by ballot. The officers shall be elected annually and any officer shall be eligible for re-election. Candidates for offices shall be elected upon receiving a plurality of all votes cast. Candidates for membership shall be declared elected provided not

more than two (2) negative votes are cast.

Section 3. Application for Fellowship must be made in writing and signed by a Fellow of the Academy to whom the applicant is personally known. The Secretary shall present the applications to the President, who in turn will refer them to his Investigating Committee, and only those reported favorably by this Committee shall be placed before the Academy for vote.

Section 4. A nominee for Honorary membership shall be proposed by the Board of Directors who shall state his qualifications

in writing. He shall be elected by the Academy.

#### ARTICLE G. Dues.

Section 1. An applicant for Fellowship shall pay an initiation fee of \$5.00 with application. This shall be returned it applicant

is not elected.

Section 2. The annual dues of Fellows shall be \$2.00.

Section 3. Honorary Members shall not be subject to initiation fees or annual dues

Section 4. Any member whose dues remain unpaid for six (6) months shall be declared in arrears. The Board of Directors may then remove him if he fails to pay his delinquent dues within thirty (30) days after notification by the Treasurer.

Section 5. Resignation must be submitted in writing, and may be accepted by the Board of Directors, provided all indebtedness

to the Academy has been discharged.

Section 6. The Academy shall issue to Fellows on entrance to membership a certificate of membership and an emblem which shall be the property of the Academy; the Fellow making a deposit on receipt of same. In case of expulsion or resignation this shall be returned to the Academy and deposit refunded.

# VALUE OF AMERICAN HORTICULTURAL LITERATURE.

In your last issue, Mr. G. H. Engleheart complains of the number of Notes from American literature appearing in the Journal of the Royal Horticultural Society, affects certain suggestions concerning them, and says they are "very dull padding," "quite valueless to the It is very unlikely that a discussion on home reader." alleged demerits in these Notes can be of interest to your readers, but in the interest of accuracy I should be glad if you would insert this letter. Mr. Engleheart has been at the trouble of counting the abstracts (wrongly, indeed all his figures are inaccurate), and has singled out seven of them (quoting the title of only one of the seven correctly) as failing to provide him with either amusement or instruction. It would be superfluous to most British readers to state that in no other country has scientific investigation been applied to the problems of plant cultivation to such an extent as in the United States of America; none has so highly organized a system of experiment stations, so many men, or such large grants from public funds, and in none is the output of literature so enormous. Nor need I discuss the value of a knowledge of the results of experimental work to those engaged in cultivation. That they gave him no amusement I can well believe; they were not intended to be amusing. -Pred J. (Inttenden in Gardeners' (Intent le Lin, lish).

# **QUERIES and ANSWERS**

We believe the greatest good can be accomplished for the greatest number, by instituting a query column; or an exchange of experiences, on practical propositions, by our readers.

You are invited to contribute questions, and answer others.
Each question as received will be given a number, the questioner's name will not be published, but the source of the answer will be given unless otherwise requested.

We all have something we would like to know more about. Here is your opportunity to ascertain somebody's experience in just that matter.

atter. Nothing will tend to better fellowship than helping each other. Take advantage of this "Question Box."

What other shrubs than Barberry and Privet, and what other vines than honeysuckle and ivy can you recommend for city gardens? Which of those named do you consider the most hardy? New York.

In addition to the Barberry and Privet, Spirous Van Houttei and Thunbergi, the Dentzias, Weigelas, Libaes and Syringas, or Philadelphus, are all absolutely hardy and suited tor city gardens. Regarding times other than honeysuckle and try, I strongly recommend Ampelopsis Englemani, Arostolochia Sipho, Akebia quinita, Actimava arguta, Wistaria in variety, with Euonymus radicars the most dependable hardy evergreen climber.

ARTHUR HERRINGTON.

Will you advise on the proper treatment of azalea plants after blooms drop to bring them through the summer in good condition for blossom around Christmas time? Also in regard to the socalled Holly Bush after the berries and the leaves drop? New leaves are appearing now in great numbers on the plants, and yet the berries are not all gone. These plants are also wanted in full foliage and with berries by Christmas.

H. W. C. New York.

Replying to the above inquiry would recommend that after the azalers have dropped their blooms that the plants be placed in an early vinery or heated structure maintaining 55 to 60 degrees at night to induce growth for next year's flowering. Feed the plants liberally with liquid cow manure and syringe with clear and soot water twice daily to keep them clean and healthy. On completion of growth, remove to cool house or frame and in June they may be placed in holes outdoors dug to depth of pots with a layer of ashes placed in holes to prevent worms entering the pots. The situation most suitable would be where plants may be partially shaded from afternoon sun. Keep syringing and watering and feeding occasionally. Before frost occurs bring plants into cool house and top dress any requiring it, using peat and sand, or leaf soil will do, potting very firmly. Bring into heat 60 degrees night temperature in November to get bloom for Christin, s. keep feeding and applying syringe well, and as buds develop a good soaking in tub or bucket will help to plump them up. Place in cool house as flowers open.

For holly the treatment advised is that if berries are still on bush in April they may be pulled off and stood outdoors as frosts are over and weather grows warmer. Later they should be placed into ground as recommended for azaleas to prevent drying out. It flowering in autumn and brought into cool house berries should tipen by Christmas. Keep as cool as possible without permitting frost to get at them. "GROWER.

Having had my peach crop ruined the last two seasons by late spring frosts, I have decided to experiment by burying 25 pounds of ice about the roots of my trees, in the expectation that this will retard budding until the danger of frost is over. If any of your readers have ever attempted a similar experiment I would appreciate hearing of their results, or of any other method that might hold the trees from budding until after all danger of frost is past. A. C. S.

Ôklahoma,

A matter that might prove of interest to many of your readers would be a discussion, through the columns of the "Gardeners' Chronicle," as to the comparative hardiness, and general worth otherwise, of Dutch-grown and English-grown hybrid rhododendrons transplanted in this country, say around Boston, New York and vicinity. There are also some other questions in regard to rhododendrons, which I will refer to later, that might be of interest, and on all of which I am seeking information myself.

Is, for instance, rhododendron album elegans, propagated and grown for a number of years in Holland, as hardy or otherwise, as the same variety, propagated and grown for a number of years in England, and then planted out in this country?

My own opinion, based, to be sure, on rather insufficient observation and experience, is that two plants of the same variety, one grown in Holland and one grown in England, are equally hardy and of equal vigor of growth, floral productiveness, etc. While, as I have stated, my observations have not been as broad as might be desired, I may say that I have had considerable experience in the matter, extending over a period of ten years or more. From time to time I have procured hybrid rhododendrons from nurseries in the vicinity of New York, Philadelphia and Boston. Some of these were freshly imported from the other side, and others had been established here some time; others still were of varying degrees of naturalization between these two extremes. Now, while I am not sure, I surmise the most of them were originally Dutch-grown; a very few I know to have been English-grown. As far as I have been able to follow up the various plantations in which these rhododendrons were used, they seem to be doing finely, proving as hardy and satisfactory as rhododendrons ever are; the few definitely known, however, to have come from England showing no superiority over those which probably came from Holland.

However, a number of nurserymen and growers are quite sure of the superior value of English-grown hybrid rhododendrons, stating it as a fact beyond dispute, some accounting for it merely by climatic differences, others by soil differences, others by differences in the stocks used for grafting and others by a combination of two or more of these circumstances.

It is said that in England R. catawbiense is largely used as a stock, and that in Holland R. ponticum, and occasionally the form known as Cunningham's white-a variety or hybrids of R. caucasicum—are used, the implication often being that the supposedly tenderer R. Ponticum would necessarily not produce as hardy a plant as when R. catawbiense is used for a stock.

The question suggests itself, What form of R. catawbiense is used as a stock? A form of so-called R. catawbiense frequently imported from the other side seems to be quite a different plant that the true R. catawbiense offered by collectors of native plants in this country, and not as hardy, perhaps not much hardier than R. ponticum. Is this the form used as a stock? If so, how much better is it than R. ponticum?

In the spring of 1904, which had been preceded by an unusually severe winter, I saw on Long Island, N. Y., a fairly large hybrid rhododendron (I have no record of the variety), say, five to six feet high, from the base of which suckers, evidently R. ponticum, had grown to a height of two or three feet. These suckers had grown to a height of two or three feet. These suckers were very much "scorched," but the rest of the plant, the hybrid part, had emerged from the winter's test about as green and fresh looking as it was the fall before. This occurrence suggests that, possibly, where rhododendrons are grafted down low, so that the stock has some protection from the winter's severity, R. ponticum does not have that unfavorable influences on the scion it is sometimes said to have.

One nurseryman of this country has said that he imported rhododendrons from Holland quite small, and grew them for a number of years in his nursery "to get the water out of them." Another nurseryman has said that Dutch-grown rhododendrons seem more susceptible to drought, the first year or so, than those from England, but that thereafter there is no difference in this connection. The question is pertinent: Are not hybrid rhododendrons obtained from England sometimes really of Dutchgrowth?

Another question: Are own root hybrid rhododendrons obtainable, and have they any advantages or disadvantages as compared with grafted plants? Suckering in the case of rhododendrons seldom, if ever, proves as much a nuisance as in the case of roses, etc.

Following is a recapitulation of the chief points to be brought out in the discussion:

- The comparative hardiness in this country of Dutch and English-grown hybrid rhododendrons of the same kinds.
  - b. The causes of the difference, if any.
- c. The comparative vigor (aside from hardiness), floral productiveness, quality of foliage, etc., of Dutch and English-grown hybrid rhododendrons.
- d. The cause of the difference if any.
- e. The availability and merit of rhododendrons on their own

The opinions advanced in the foregoing as my own are, most of them, only tentative. I wish to approach the matter with an open mind, and I am ready to change my views upon the submission of experiences which may prove my position in the matter wrong.

HANS J. KOEHLER.

Mass.

Can any of your readers advise me of the value of spent hops from breweries as a fertilizer? What is the best method to use for mixing and applying them to the soil?

#### OYSTER BAY HORTICULTURAL SOCIETY

The regular monthly meeting of the Oyster Bay Horticultural Society held on Wednesday evening, March 24, was most blooms and pot plants. The judges were Messis, Alired Walker, John L. Chapman, Messis, Afficial volumer, norm of the experiment of the extra transfer in the experiment of the extra transfer in the experiment of schilzanthus, Jas. Duthie first prize; for experiment of the hibition only, group of plants by James Duthic, special prize of \$5; specimen of Azalea by Jos. Robinson, C. C.: forced blac by Jos. Robinson, C. C.: amaryllis scedling by Jos. Robinson, honorable mention; vase of mixed flowers by John Sorosick, honorable mention; vase of Darwin tulips by Chas. Mills, thanks of society; vase of Cottage talips by Jos. Robinson, honorable 3 pots of Lilium Longitlorum by Clas. Mills, henorable mention; 3 heads cauliflower by Chas, Mills, honorable mention; vase of Cottage tulips by Arthur Pat-Frank Kyle, thanks of society; vase of carration, Enchantress, Jas. Duckham, honor-Alle mention; vase of antirchinum by Frank Kyle, thanks of society: vase of antirrhimim. Jas. Duckham, hoporable mention.

Mr. John Everitt, President of the National Association of Gardeners, and Mr. C Ebel spoke on the benefits of the National Association of Gardeners to the local society and the individual gardener. Mr. Everett's remarks were brief and to the point. Mr. Ebel handled his subject very well and enlightened all who cared to ask questions. The questions were asked and freely discussed by a large number of members and their friends who were present.

Mr. Jas. Duthie donated his prize received for group of plants to the society, to be used at the next show, as the society saw fit

Mr. Herbert Oliver and Mr. Donald Rossi were elected to active membership, and eight petitions for membership were received.

The exhibits for next meeting will be 1 pot campanula, 1 pot lilies and 2 heads lettuce.

ANDREW R. KENNEDY, Secretary.

#### PITTSBURGH FLORISTS AND GARDEN-ERS' CLUB.

The regular meeting of the club was held on the 2nd inst, in Parlors A and B of the Fort Pitt Hotel.

Mr. Carl Becheret, gardener at Dixmont Hospital, showed cyclamen in different colors and terms. Many of the flowe's were waved and fluted after the manner of the Spencer sweet peas, but more pronounced. In some cases the blooms opened out nearly flat. All the cyclamen he showed were either units ofly floriterous, or revel in the shape and size of their blooms. He also showed tulips, hyacinths and some good carnation seedlings. He was awarded a cultural certificate for cyclamen.

Mi. I. Tyler, Lardence for C. D. Armstrong, Pittsburgh, showed seedling cypripediums, Dendrobium Nobile Virginale, a good white suitable for commercial work, and Odonfioda Bradshawae. He was awarded a cultural certificate for the cypripediums.

foreman, showed hyacinths La Victoire; foreman, showed hyacinths La Victoire; Correggio, a white with very large bells; Prince of Austria, his favorite single tulip; daffodils and Matador, a dark red, very fine Cineraria.

An interesting discussion took place better (M. Tresson M. Becher (Mr. Jones daining that toba co-stems in a greenhouse, especially when wet, were of no value as at insection, and M. Becher (S. M. Jones daining that to all the pt. for a strend of a virond tree, when them, When a loss disagree, etc., etc.

A talk was given on the "Cities of Germany," illustrated by colored lantern slides, by Dr. Emil Krapf, who gave the interesting talk on "Eathe Active Earth" to the February meeting.

We don't shoved two plants of adviaone grown in radio-active earth, the other not. They were passed around among the members that the difference might be noted, which was in favor of the one grown in the earth treated with the radio-active fertilizer.

At the April meeting it is expected that some of the professors from Pitt University will to be a some late discoveries in chemistry as applicable to plant growner.

H. P. JOSLIN Secretary

# NEW LONDON HORTICULTURAL SOCIETY.

The New London Horticultural Society held its March meeting in its new home, located in the Municipal Building in State street. The speaker for the evening was Mr. W. J. Schoonman of the New London County Nurseries, Subject, "Trees for Pleasure and Profit," discussing how to preserve the trees for timber and beauty,

Mr. Chas, Schrier, of Boston, who has charge of Mr. Schoonman's spraying and care of trees, gave a few helpful remarks when and how to spray, showing specimens of twigs, etc., that where affected by scale and those which had been given care and attention.

The above speakers opened up quite a varied discussion among the members of the society, and a very pleasant evening fol-

Cyclamen and stocks were exhibited in fine condition by Ernest Robinson, Plant Estate; Darwin tulips, schizanthus and narcissus from the Harkness Estate.

Some very fine spikes of snap-dragon came from Mr. Neumann of the Mitchell place; carnations and Forsythia were shown from the treasurer's garden, "S. L. Ewald," and the president's Alfred flowers, the lat-

ter being in charge of the G. Palmer Estate, Pequid avenue. The schedule for 1915 exhibitions were on hand for the members.

Professor Jenkins, of New Haven Experiment Station, is expected to address the April meeting of the society

STANLEY JORDAN.

Harkness Estate, New London.

#### CONNECTICUT HORTICULTURAL SOCIETY.

The first March meeting of this society was held in the County Building, Hartford, on the evening of March 12. President Warren S. Mason presiding. It was voted to hold a show on Thursday, June 10, the proceeds above expenses to go to the Red Cross Society. As announced, this was "Carnation" night, and Mr. William A. Dawson, of Willimantic, exhibited his new seedling carnation "Red Wing," registered under No. 565 by the Carnation Society of America. Mr. Alfred Cebelius exhibited the following roses: Ophelia, Sunburst, Killarney and Mrs. Aaron Ward, also carnations White Enchantress, Enchantress and Beacon. A. N. Pierson, Inc., of Cromwell, displayed a vase of Arawana, a very dark red carnation. President Mason had on exhibition a vase of Spirea Philadelphia, also carnations Matchless, Princess Dagmar, Philadelphia, J. H. Gray and Mrs. C. W. Ward. John F. Huss, G. H. Hollister and George B. Baker were appointed judges, and, after much deliberation, decided as follows:

William A. Dawson, first-class certificate. A. N. Pierson, Inc., first-class certificate. Alfred Cebelius, cultural certificate.

Warren S. Mason, honorable mention.

The following committee of three was appointed to make final arrangements for the June Flower Show: G. H. Hollister, chairman; Ed. A. Brassill and J. M. Adams.

At the next meeting there will be a demonstration of the art of pruning fruit trees by G. H. Hollister, C. H. Sierman and John F. Huss, W. W. Hunt to furnish the stock. This will also be rose night, and we expect to have our lady members with us.

ALFRED DIXON, Secretary.

# "The Typewriter of Perfect Presswork"

THE flawless presswork of the new Royal Master-Model 10 carries the high-grade business message in as fine form as your thoughts themselves! Royal presswork reinforces the resultgetting power of your business-letters—for it adds the forceful stamp of quality to every letter you sign.

Heretofore, you have been obliged to accept a standard of typewriting inferior to high-class printing, yet you would not accept poor printing. But with the new standard of "typewriter presswork" created by the new Royal "10," it is no longer necessary to accept inferior typing in your office.

Pick up the letters you have signed to-day. Examine them—then see a sample of the faultless presswork of the Royal! On which kind of typing will you send your signature to represent YOURSELF?

Which one will you trust to convey unmistakably to the world the character of your house?

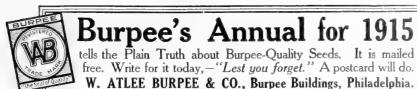

# Get the Facts!

Send for the "Royal man" and ask for a DEMONSTRATION. Investigate the new *master-machine* that takes the "grind" out of type-writing. Or write us direct for our new brochure, "BETTER SERVICE," and book of facts on Touch-Typing—with a handsome Color-Photograph of the new ROYAL MODEL 10—all sent free to typewriter users. "Write now—right now!"

ROYAL TYPEWRITER COMPANY, Inc. Royal Typewriter Building, 364 Broadway New York

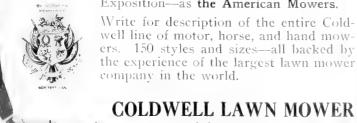

# Coldwell Walk-Type Rotor Mowers

THESE latest additions to the Coldwell line are real labor savers for small parks and estates. All have the Coldwell patented demountable cutters—the cutters that make long delays impossible.

The Walk Type Line is partially described below:

Model.	Weight on Drive Roller.	Width of Cut.	Capacity Per Hour,	Price.
F	1,100	40	1 acre	\$475
G	600	35	31 4	\$325
Н	500	30	1/2 44	\$250

Coldwell mowers are used exclusively at the Panama-Pacific Exposition—as the American Mowers.

# LAKE GENEVA GARDENERS' ASSOCIATION.

The first regular meeting of the above association, under the new board of directors, was held Tueslay, March 16 in Hortz cultural hall. The routine business being disposed of, the reports showing the association in good financial condition, the following new members were proposed and elected by acclamation: R. P. Montgomery, S. Gotter, P. Peterson, H. West and F. Brady.

It is the plan of the new board of directors to make the meetings more interesting and instructive, and it is hoped that in the future, one or more interesting papers on seasonable subjects will be read and discussed at the meetings. A. Martini read a paper on "Vegetable Culture in Frames" and Alex, Johnson gave a short talk on "Seasonable Work." Both papers were well discussed and a very interesting and instructive evening was enjoyed by those present. For the next regular meeting, April 6, T. Sampson will talk on "Sweet Pea Cultivation" and T. Blackwood on "Roses Under Glass."

"Roses Under Glass.

The board of directors for 1915 are as follows: A. J. Smith, president; W. P. Longland, vice-president; T. Niles, secretary; A. Johnson, treasurer; A. Martini, F. Sampson, T. Blackwood, M. Barrett, W. Wahlstelf.

# RAILWAY GARDENING ASSOCIATION.

A special nection of the mittee of the Railway Gardening Association was held in Philadelphia, Pa., on March 25, for the purpose of perfecting arrangements for the 1915 convention to be held on August 17 to 20, in Detroit, Mich. The following members were present: President Paul Huebner, Philadelphia, Pa.: Vice-Presidents John Gipner, Niles, Mich.: J. E. Smith, Ridley Park, Pa.: J. E. Byrnes, Ref. M. J. F. and Sagastony W. E. Hut big.

## WOMEN'S NATIONAL HORTICULTURAL AND AGRICULTURAL ASSOCIATION.

Under the auspices of the New York Horticultural Society the Women's National Agricultural and Horticultural Association will hold a conference at the Bronx Botanical Garden on May 7 and well known authorities on agriculture and horticulture will deliver addresses.

Although the association is a comparatively recent organization, it has grown with such rapidity and vigor that today its members are drawn from 30 states and represent widely varied interests.

Any one who believes in the objects of the association and wishes to further them is eligible to membership. This means that the membership includes women of many professions, all having a common interest in some phase of agriculture or horticulture. City dwellers with small back yards, flat dwellers with only window boxes, successful women farmers and commercial growers, women deeply interested in agriculture or horticulture but hesitant about making a start, the owner of the large estate and notable garden, landscape gardeners and amateurs, social and settlement workers. school garden and playground enthusiasts between and writers on horticulture all find a welcome in the association. Men are not excluded from membership.

Through the association a greater interest is being created among women in all phases of gardening and soil production. In fact, one of the definite aims of the or ganization is the bringing together of producer and consumer, employer and employee, gardener and land, individuals who

might form a partnership.

The formation of local branches is an other object. These branches are independent in their working, but affiliated with the parent society; they will hold local con-ferences and exhibitions, and encourage and facilitate the direct sale of produce from men and women on farms to people in town.

The work to be undertaken by the clubs will vary greatly in different regions. Some communities of producers will be largely and practically interested in marketing, mutual co-operation and the improvement of country life, esthetically as well as practically. In town and villages there is the work of school and vacant lot gardens; in suburbs there are garden clubs, and everywhere practical interest in the economic relation between the farmer and the towndweller. In every community there is opportunity for a club to undertake some

activity which very properly comes within the W. N. A. & H. A.

Officers of the association are, besides six vice-presidents: President, Mrs. Francis King, Alma, Mich.; recording secretary, Miss Hilda Loines, Brooklyn; treasurer. Miss Louisa G. Davis, Ambler, Pa., and general secretary, Miss Margaret Jackson. Englewood, N. J.

# THE GARDENERS' CHRONICLE

Is a Journal of Useful Technical Knowledge for the Advanced Amateur

SUBSCRIPTION, \$1.50 A YEAR ... 6., 10c 6/2 P.3 DOUBLUBERREE, DESHERBERGERREET 150 RS...

#### HERE'S HOPIN'!

Last year wasn't the very best -Purty hard by trouble pressed; But the rough way leads to rest-Here's hopin'!

Maybe crops waz short; the rills Couldn't turn the silent mills; But the light's behind the hills-Here's hopin'!

Where we plant roses sweet Thorns come up an' prick the feet; But this old world's hard to beat-Here's hopin'!

P'r'aps the buildin' that we planned 'Gainst the cyclone couldn't stand; But, thank God, we've got the land-Here's hopin'!

Maybe flowers we hoped to save Have been scattered on a grave; But the heart's still beatin' brave-Here's hopin'!

That we'll see the mornin' light; That the very darkest night Can't hide Heaven from our sight-Here's hopin'! -Selected.

This perfect lawn is at Harrisburg, Pa. We will gladly send you this plate and another one of it before. Appliant Hum is was used. The contrast is most convining.

Rhedodenchons in their native state are found with roots buried in rich leaf Humus. It's nature's way. Follow nature. Use Alphano Humus for

# For Your Lawn and Shrubs Follow Nature's Way of Soil Enriching

THE only difference between highly fertile soils and barren, unproductive one

is the difference in the Humus they contain. It is apparent, then, that Humus is the backbone of all soil fertility.

Nature makes her Humus from decayed vegetable matter. Six feet of leaves, for example, will make three inches of high value Humus in 250 years of so.

Down at Alphano, N. J., is a rich deposit of Humus, centuries old. This we concenpare it in powdered form, all leady for your use.

Mixed with soil, it gives an immediate and lasting fertility.

Being **odorless** and free from weed seeds, it is ideal for either new or old lawns. For gardening it can't be beat.

Reing nature's balanced ration, it is, in fact, good for every thing that grows in the ground.

For further facts and direc-

tions for use, send for the Humus Book. Let us know

amount ground you want to enrich, and we will advise quantity needed.

# WHERE WE STAND

New York.

Aplaine Mann'acturing Company, Madison, N. J.

Gentlemen:-

I am returning the enclosed bill as you have not allowed me my usual professional discount of 20% or 25%, which the other manufacturers of agricultwal chemicals allow me. Is I am acting as a purchasing agent for a great many places in this cicinty and as a large number of orders pass through my office every year, it is only just that I should be allowed the usual agency commission. Will you kindly let me hear from you in this matter? Yours truly,

Dear Sir:-

Your favor of the 28th ult. at hand, in which you ask us to allow you a discount on the enclosed bill.

We have only two prices one a wholesale or dealers price, and the other a retail price. The wholesale prices are quoted and allowed only to dealers who actually handle our products and carry them in stock.

It has always been our policy not to allow any discount to landscape gardeners or to purchasing agents of private estates, as we understand it is the custom of the estate owners to pay these buyers for

the services they render.

the services they render.

We are very much opposed to the practice of some of these buying agents who return the discounts, when they are allowed them, to their clients. This has created a false impression and one that we believe has been decidedly detrimental to the interest of horticulture and no doubt in some instances has served to discredit the loyalty of some of our best gardeners to their employers. A gardener would not be able to obtain these discounts from us and we certainly would not be justified in granting them to any other representative of the estate owners. any other representative of the estate owners.

Yours truly,
Aphine Manufacturing Company,
M. C. Ebel, Treasurer.

FUNGINE For mildew, rust and other blights. It is perfectly safe to apply to fruits and vegetables, as it is non-poisonous.

VERMINE For eel, cut and wire worms working in the soil. It can be applied to all vegetation.

NIKOTIANA A 12% Nicotine solution properly diluted for vaporizing, fumigating and spraying.

**SCALINE** For San Jose, Oyster Shell and all scale on trees and hardy stock.

If you cannot obtain our products from your local dealer, send us your order with remittance, and we will ship immediately through our nearest agent.

WITH TO

## Langley Park, Buckinghamshire, England

The impression which Langley Park gives the visitor is that of gardens within a garden, and although these are complete in themselves and of different styles, yet each has that family likeness which is necessary to make a homogeneous and satisfying whole. Although they are enclosed and separate, each garden—the Bamboo garden, the hardy flower garden, the Pinetum, as examples—is characterized by breadth and openness. Of the main garden features, says the Gardeners' Chronicle (London), it is difficult to say which is the most pleasing. For quiet promenade and meditation, the long grassbordered walk enclosed by formal clipped hedges from which one may pass through delightful old iron gates to the Pinetum at one end, or to the sundial garden, which contains wonderful clumps of Bamboos set boldly apart in a smooth green lawn, would undoubtedly be chosen.

The collection of Bamboos is noteworthy more for the

luxuriance of the individual clumps than for variety. Here are to be seen Arundinaria nitida, A. Simonsii, A. Hindsii, Bambusa Metaké, B. aurea striata, Phyllostachys Henonis, and P. aurea as dense, isolated masses of impenetrable greenery, fully 25 feet across, rising from cool, green, closely mown turf, contrasting with the swordlike leaves of Phormiums, and with a background of the luxuriant trees which give "Leafy Bucks" its name. From this sequestered retreat the way leads to borders of hardy and half-hardy shrubs-Camellias, Rhododendrons, Magnolias, Deutzias, Hydrangea paniculata, and many other genera—to the Japanese garden where a pool of magnificent Water Lilies is bordered by the graceful, arching plumes of Arundinaria nitida, by the mammoth leaves of Gunneras and stately Palms, amid which the purple foliage of Prunus Pissartii contrasts vividly. Standards of Magnolia grandiflora are studded

By Courtey of Girlener's Ctronicle, London.

THE LILY POND IN JAPANESE GARDEN, AT LANGLEY PARK, PUCKINGHAMSHIR - UNGLAND, THE R-SHOLNCE OF SIR ROBERT HARVEY, BART.

with large fragrant blossoms, which perfume the air throughout the long summer's day, and beside them are equally large examples of such spring-flowering species as Magnolia obovata and M. conspicua. Here is to be seen the original Davidia involucrata, which Messrs. James Veitch received from China, growing in a native This specimen, when it opened a solitary flower in 1911 at the Coombe Wood Nursery, was the first to flower in this country. Purchased by Sir Robert at the sale last autumn, it was planted out in the Japanese garden, where it flowered during last spring, and now appears to be thoroughly established. During the early summer, from an immense specimen of Wistaria multijuga hang racemes of lilac flowers well over two feet long. On another wall Wistaria brachybotrys bears many pods of Runner-Beanline fruits. In another enclosure Crinodendron Hookerianum was fruiting, and the flower buds, already prominent and tipped with red, promise a good display for next year. The upper growths of Solanum jasminoides were hidden by the clusters of white flowers, and a large and very old example of Tecoma (Bignonia) radicans bore many trusses of rich reddish-orange trumpet-shaped flowers. Pomegranates, Magnolias, both grandiflora and conspicua, and many other climbing shrubs, clothed the outer walls of the museum. Beside numbers of the hybrid Rhododendrons many of the species and varieties which are associated with the mildest districts of our islands seem to be perfectly happy in the warm and sheltered enclosures. Of these Rhododendrons Falconeri, Griffithianum, Thompsonianum, Gill's Triumph, and Gill's Goliath may be mentioned.

The herbaceous borders are a comparatively new feature, and have been greatly extended under the supervision of the young and enthusiastic gardener, Mr. W. Willcocks, who has had charge of the fine gardens during the past few years.

#### INDIVIDUALITY IN GARDEN MAKING.

In general, garden making may be classed as either formal or informal. In the formal design of gardens, nature is made to fit some plan as conceived by man; in informal arrangements the plan is made to fit into the existing natural features. With this simple distinction *Billerica* reviews gardens as they have been built.

It says the formal gardens of the past have become models for the larger gardens of today. They first reached a high state in Italy and are known as Italian gardens, although as famous ones are found in France, England, and other European countries, and there are not a few in America. The gardens of Versailles in particular show the most costly and extensive development of this style of gardening. . . .

The old-fashioned gardens of our grandmothers were essentially formal in character, whether on the scale of that at Mt. Vernon, or the little front yards in old Salem or elsewhere. They were of a simple geometrical arrangement, with walks for easy access, from which to view attractive parterres full of flowers, with seats and shelters for comfort and convenience. Something of the spirit of simplicity of these old gardens is entering again into the smaller gardens of today, along with an appreciation of the simple types of flowers that were there grown.

Some of America's gardens have been designed by architects in close connection with the home structures. In such gardens architectural features often dominate, the vegetation being merely an ornamental accessory. The topiary garden, in which the principal features are trees cut to formal or erratic shades, as shown at Levens Hall in England, is also represented at the Hunnewell

estate at Wellesley, Mass. The area so treated varies from a small enclosed court to some large area near buildings, enclosed by walls and hedges. Here the strictly formal and the more informal may meet, as many American gardens witness.

Another style of gardening known as "carpet bedding," a geometrical arrangement of plants, at one time exceedingly popular, is now confined to a few public parks and

to a very limited number of private estates.

The natural or informal style of gardening began as a revolt against excessive formality. Today the greater part of our garden operation is the result of modern modifications of the principles of gardening as first inaugurated in the great private parks of England.

From a desire to allow the works of nature to predominate in garden operations, the next stage was an ambition to imitate in planting the arrangements of nature so that even the hand of man would be concealed. This idea of "wild gardening" was often carried to extremes, particularly in England, where this kind of gardening first found wide favor.

In England, too, was evolved the idea of the "hardy border," the grouping of hardy perennials in a natural way, modified by the conditions about our homes. A great many estates of large size, as well as small lots, have found this method, adapted to our ways of living, the best solution for the arrangement of their gardens.

Gardens that are particularly influenced by the existing features of the ground surface, as rock gardens, water gardens, etc., are more recent phases of natural gardening. They depend upon their fidelity to nature in fitness to their site, and in the details of their arrangement, for their beauty. . . .

The gardens of Japan are not natural gardens in the usual sense; nor are they formal gardens as usually defined. They differ from all western gardens in that they represent by certain symbolic type forms the natural landscape features of Japan. By their very nature they are not suited to be boldly copied in other countries, but the principles by which they are builded are of universal application, and are finding their way into the American gardens of today.

Special gardens, that may be either formally or informally treated, are now common. We have many seasonal gardens, as a spring or early fall garden, gardens devoted to special colors, and gardens for particular kinds of plants, as rose or iris gardens. These are destined to be seen more and more as the garden art becomes more intensive.

There need be no monotony of arrangement in the gardens of any region. Examples enough have we of what is truly artistic and expressive that no one need copy his neighbor, . . .

#### THE YEWS.

Yews are propagated by seeds which do not germinate until the second year, but seedlings invariably grow faster than plants raised from cuttings.

Cuttings can be rooted very readily in a cool green-house or frame, but do not have the same freedom of growth and so do not develop into as fine specimens, their growth is more likely to be low and spreading. Varieties grafted on seedlings even make better headway than cuttings.

As the seeds take so long to germinate it is better to gather them when ripe and put them in a heap when the fleshy covering will rot away, then mix them with fine sifted sand and bury them in the ground about 6 inches deep, where they may remain until the time for sowing.

The Yew is a very ancient form of vegetation and really belongs to past geological ages. The present forms are very broadly dispersed over the north temperate zone.

Taxus baccata, English Yew, is indigenous through Europe to northern India. There are numerous garden varieties, including the well-known Irish Yew.

Taxus canadensis, Canadian Yew, is the American representative of this family.

Taxus Cuspidata, the Japanese.

In addition to these there is a Florida one, Taxus floridana and one from Mexico, Taxus globosa.

Botanists are of the opinion they are all geographical

varieties of one species that through the ages have adapted themselves to the conditions under which they are growing.

The yews thrive in almost any soil and are wonderfully tenacious of life when once established, endure shade well and so make admirable plants for small city yards.

Unfortunately, they are not particularly hardy and suffor from dry frosty winds in winter, especially when exposed to the winter sun, so that it is better to protect them in much the same way as the Rhododendrons require; in fact, Rhododendrons and vews thrive under about the same conditions. As far as hardiness is concerned, the Canadian Yew is considered the hardiest, but a writer in National Nurseryman says he has seen them winter kill when the Japanese and English came through unharmed.

#### MAKING A ROCK GARDEN.

The pleasure of building a rock garden is interestingly described by a contributor to the Gardeners' Magazine (British). The many varieties of plants, with their wide-Iv different habits, make the work a most fascinating one. Careful study of the suitable environments of the various rockery plants is necessary for success. Some of them thrive best behind sheltered boulders out of the reach of the sun's scorching rays; some where they can flaunt themselves on the driest and warmest slope, while others must be planted nearly perpendicularly in order to prevent the moisture lodging in their hearts and rotting the plants. He says it is possible in a rock garden, or a rockery, to produce something in bloom from Januarywhen Saxifraga Burseriana uplifts its brave little head to face the wintry blast-to mid-December, when a stray bloom of Primula capitata may glow deeply purple, its stem and calvx white powdered, like the snowflakes falling softly around it.

But May, June and July are the heyday of alpines: then color and scent are alike rampant, and the rock garden a dream of fairy-like beauty. Campanulas tumble over the gray stones like shimmering waterfalls, and Dianthuses give off their warm, luscious fragrance. Aubrietias, mauve and purple serve as a background to show up the golden stars of the St. John's Wort, while the silvery edelweiss, and sky-blue Gentians and Primulas, myriad-hued, from every clime, complete a group whose

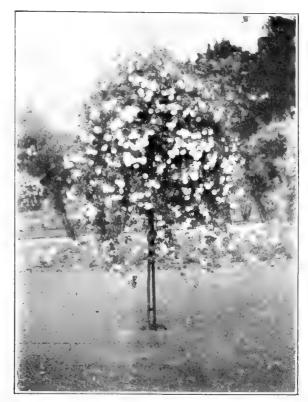

brilliance is well-nigh dazzling.

One of the greatest arguments in favor of a rock garden is its wonderful faculty for "coming up smiling" under the most untoward circumstances. A night of rain and storm has laid low the herbaceous border, but no sooner does the sun shine out again than rock Primulas, creeping Antirrhinums, and Avens and Mimulus, St. John's Worts, Sedums and Saxifrages, Androsaces and Lithospermums are glowing and scintillating in all their prismatic colors, unruffled and unharmed. Other advantages are that alpines need no tedious tying up, no ugly sticks to support them, and for anyone who has only a small garden, and not much time to work in it, rock plants yield the best return in point of effect and interest.

Another thing to be remarked is that alpines are not naturally delicate, although it is worth while to humor, even to pamper them, until the tiny plants are firmly established. A pane of glass is often very efficacious in a damp winter, and we always dress the plants with some leaf-mold in autumn, and put sand round their crowns. Under this treatment, more as a preventive than a necessity, even Primula Winteri, accustomed to the rare, clear atmosphere of the high Himalavas, flourishes and blooms in profusion.

#### A WEEPING STANDARD ROSE.

Such perfect specimens of weeping standard roses as the one here figured are not, we venture to say, of very frequent occurrence. This particular plant is the wellknown Dorothy Perkins, budded upon a brier stock at a height of 6 feet from the ground. The total height of the

SPECIMEN WEEPING STANDARD ROSE, DOROTHY PURKINS,

specimen was 9 feet, and the diameter 4 feet 6 inches, so that it forms a beautifully symmetrical oval. When photographed there were several growths 12 feet long. Such vigor is only possible when the tree has all that its nature demands. Every chance was given it from the first, for before planting took place, a hole was dug 3 feet by 5 feet, 9 inches of broken bricks were placed at the bottom and fresh turfs, with the grass side downward, were laid over these. A good mixture of clayey loam was then filled in, chopped up roughly with decayed cow and horse manure, also a fair proportion of burned earth and vegetable matter.

#### THE BUTTERFLY BUSH.

It is doubtful whether any new shrub ever distributed in this country offered so much to all classes of garden makers as *Buddleia variabilis*, writes E. I. Farrington, in *Country Gentleman*. It is coming to be generally known as the butterfly bush, because of the remarkable attraction which it has for butterflies of all kinds and colors. Not only is it very hardy and extremely easy to grow, but if set out the last of April or the first of May it will be blooming early in August of the same year, even in New England, and it will not cease to bloom until cut down by the frost.

The plant was discovered in the wilds of Western China, but it thrives in the soil and climate of the United States. Sometimes it is called the summer lilac, for the flowers somewhat resemble those of the lilac in form. They are borne closely on long spikes or stems and are mostly a light heliotrope in color. Every branch bears a flower spike, and if the blossoms are cut constantly with as long stems as possible new branches will continue to appear, with new spikes of bloom, as long as the season lasts.

Then, if the whole plant is cut down to within 8 or 10 inches of the ground in the spring, a host of new branches will grow in a very short time and there will be a wealth of flowers—and of butterflies. Quite apart from its own merits as a flowering shrub, buddleia is worth growing for the great number of these beautiful creatures that it woos to the garden. Sometimes scores may be counted on a single bush at one time.

In spite of their rather peculiar shape the flowers of the butterfly bush lend themselves well to house decoration, particularly by daylight. They keep several days in water if they are put in a fairly cool place and are not crowded in a vase.

Though buddleias are an attractive addition to the border planting, they are most effective when massed in beds. They grow from 4 to 6 feet high, like sun for at least half the day, and need an abundance of water if they are to give the best results.

Flowering as freely as they do, too, they prefer rather rich soil. In the Northern States it is a wise precaution to heap up soil round the lower part of the plants in the fall, in the same manner that roses are protected from the severity of winter cold.

#### WINTER DAMAGE TO EVERGREENS.

Many reports are coming to hand of considerable damage done to evergreens, especially rhododendrons and other broad-leaved varieties, during the past winter, which has resulted in the killing of many of these plants. E. H. Wilson, writing in Horticulture, says: the winter has been an extraordinary mild one, it cannot reasonably be claimed that low temperature has been the cause. The bright sunshine during the closing days of February and through March combined with the total absence of precipitation, must, I am convinced, be held responsible. . . This applies forcibly to broad-leaved evergreens. The bright sunlight in March causes This applies forcibly to broadrapid transpiration (i. e., loss of water from the leaves) and the ground being still frozen the roots are perforce inactive and cannot make good this loss and the cells of the leaves collapse. The effect is the same as if the plants had been submitted to a fierce scorching blast.'

In the same publication W. N. Craig says: The summer and fall of 1914 were abnormally dry. The roots of all plants, unless they had been watered or mulched, were dry when the ground froze up. We got copious rains in February, but this did not reach the roots of plants which were not well mulched. The bright and

arid conditions in March and a large part of April would not have been so serious had the roots of evergreens been moist.

While it will probably be admitted that the foreging reasons will account for the heavy losses, why is it that some half-hardy sorts are not harmed at all, and that while plants of one particular sort are dead, others side by side under precisely similar conditions are harmed little if at all? No doubt we must look back further than 1914 for "the beginning of the end."

I have in mind at this moment a collection of splendid rhododendrons, some fifteen feet high, located at Pawtucket, R. l., which came through the winter in perfect condition; also beds of these noble specimens at Waltham, Mass., which never looked better. At Faulkner Farm, amongst some hundreds of rhododendrons we had not a single death, and merely occasional small branches killed. On all these estates the plants were kept well mulched and were well soaked last fall.

I believe there is less in the location than in providing these broad-leaved evergreens plenty of mulch and moisture. Windbreaks for these and the newly planted evergreens are also I believe more necessary and important than overhead covering. The latter is more harmful than helpful.

T. D. Hatfield expresses his views on the subject, saying: The past winter has not been severe as regards cold. We have had winters with much lower temperature, with less damage to report. I have no doubt, as Mr. G. H. Wilson says, that "winter damage to rhododendrons" is due to excessive sunlight during the late winter months. Plants in the full sun suffered most, and the damage was greatest in front of windbreaks and least where the wind had full sweep—as if the wind had tempered the sun's rays.

We do not like to say we neglect any of our rhododendrons in the matter of water in summer and covering in winter, but we have to admit that our neglected beds suffered least. One bed, "high and dry," on a bank, with little water and hardly any leaf covering, came through in first rate condition, and it has always.

Some notable gardeners of my acquaintance declare that winter covering is a "delusion and a snare." In some respects our experience during this later winter seems to support this contention. Certain it is that our young stock rhododendrons and kalmias in the vegetable garden were badly hit. I can't believe they could have suffered more if no protection at all had been given. About fifty per cent, are dead or badly injured, but when one sees among these half a dozen plants together as bright as if there had been no winter at all and all around them plants dead, one is hard put to for an explanation, or even a theory. This sort of thing we find throughout all our beds-plants standing, so to say, alone untouched. All these plants were well watered right up to the time they were covered for the winter, so as to make sure they did not go into the winter dry.

I am convinced, however, that evergreens which go into the winter dry do suffer in just such weather as we had this past March. It is almost an axiom that evergreens must be root active in winter.

A gardener joining the police force, received instructions, on going out on his beat, to bring in any "porch climbers" he may find. The following morning the station presented the appearance of a nursery shed, for the neighborhood had been stripped of its vines.

#### VIEWS OF LONDON PARKS.

We have been able to procure views of two features in the London (Eng.) parks-one showing an avenue in Regent's Park, on either side of which, though not shown in the photograph, there are broad open spaces of lawn with flower beds. Large vases on tall pedestals are another notable addition here. These are filled with Geraniums, Fuchsias, Salvias and such like in conical masses. Placed as they are they are very effective.

The other scene is typical of a bright day in Hyde Park, London, beneath the umbrageous Elm trees of Rotten Row. Though laboring under such a curious name, said to be a corruption of route du roi or king's way, this avenue is one of London's most fashionable. Great banks of Rhododendrons are massed on either side a little way back, while the flower bedding, the water

gardens, the dingle where the wild rabbits disport in peace and quietness, yet in view of the people, together with the smooth lawns, the bandstand and other amenities combine to make this one of the most frequented and beautiful park resorts of the great English metropolis.

#### A BEAUTIFUL WATER GARDEN.

The picture accompanying these notes is of the water garden at the Pleasaunce, Overstrand, one of the finest and best kept of the gardens of England. The situation is a choice one, embosomed amid trees on the windward sides but open to the south and southwest. A great diversity of trees, shrubs, Roses and climbing vines are used around the sinuous pools of water and a fine selection of Water Lilies, Irises, Juncus, Senecio, Clivorum, Ly-

#### PHEASANTS REARING AND HATCHING.

By JNO. W. Talbot, Indiana.

Any one who can raise chickens can raise pheasants. The one is no more difficult than the other. General information as to the beauty of plumage, delicacy of flesh, history, etc., of Chinese pheasants can be found in encyclopaedias and books without number. Therefore, I will devote this article to a practical statement of the actual procedure that I believe best for the hatching and rearing of these birds. In captivity the Chinese pheasant does not usually set or nest. It lays wherever it may happen to be, usually about sundown and consequently at that time it is best to avoid disturbing the pheasant hen unnecessarily. The eggs should be gathered frequently and not permitted to lay around the pheasant yard, because this bird at times is tempted to eat its own eggs if they remain before it too long.

For hatching the eggs the best results are obtained by using Bantam hens. Set your hens on the ground. Make a small depression in the ground and use sod or cut straw or hay for nesting material. When possible place the nest under bushes, under brush or other cover. The eggs of different pheasants require different lengths of time for hatching. For instances the Ring-neck 24 days, Silver 27. Golden 21, Reeves 25 and Amherst 22. The eggs should be moistened from time to time just as one

would moisten the eggs of chickens.

Do not disturb the young chicks for 24 hours after they are hatched and unless the weather is very warm, do not give them any water until they are a week old. The first food for young pheasants may be hard boiled eggs and they should not be fed until they are 24 hours old, after which the boiled eggs can be grated for them through a piece of wire window screen and they should be fed four times a day, or every three hours, being careful to only feed them as much as they will clean up. Too much care cannot be taken to prevent over-feeding. It must always be kept in mind that the pheasant is a light eater and naturally a wild bird and requires only from one-tenth to one-twentieth part the amount of feed that a chicken should be fed. Instead of boiled eggs the first food of the young may be made up of hard boiled eggs and potatoes, both being thoroughly boiled in the same kettle until the potatoes are soft, when the volk of the egg will crumble. It is well to use only the volk. Pare the potatoes and mash them, using two parts of potatoes to ione of egg. Use the same food the next day and the day after. You may then add a few leaves of lettuce, onion tops or millet. Keep plenty of green food before them. Feed in this manner for a few days until strong enough to run about. You may still continue feeding them in the same way if you wish, but after they are ready to run about, if it suits your convenience, you may scald thick sour milk until the whey and curd separate, then strain and use the dry curd, mixed with equal parts of ground hemp and canary seed, about four parts of curd to one of seed with a very little pepper added. should be staple food until they are six weeks old. Another good food is wheat bred moistened with sweet milk and mixed with baked potatoes. Scalded corn-meal, cracked wheat or corn, hemp and canary seed whole, ripe tomatoes, or any food used for little chicks will answer as they grow older. Never give pepper grass (sorrel) to pheasants. It is unhealthy for them.

The pheasant naturally is very strong in flight. Con-

fining pheasants was first accomplished by covering the pens or yards with wire netting, but the expense of that method was so great, that pheasant raisers have abandoned it and instead of doing that many simply clipped one wing of its feathers to prevent flying, but the best and most successful raisers of these birds take a very sharp shears when the bird is about four days old, prepare a good sized saucer filled with boracic acid or powdered calomel or even wood ashes, and take each chick when between four days and a week old and clip off one wing at the first joint, immediately dipping the raw end of the wing into the powder and turning the bird loose. This is called pinioning. It has no injurious effect on the birds, they recover at once and it prevents their flying thereafter more than three or four feet in height and permits them to be confined in a garden or yard surrounded by a wire netting fence. Birds raised to be turned loose for stocking purposes should not be pinioned for it prevents them escaping from their natural enemies.

During the breeding season the male pheasants are very jealous and inclined to fight. With them fighting is no unimportant matter. They frequently fight until one or the other is killed and occasionally until both are so injured that they are thereafter of no value. On that account as the breeding season approaches, the hens should be separated and placed in the pens where they are to lay and the males that are to be kept with any hens should also be separated, not more than one male being permitted in one pen. Those males that are not permitted to run

with hens, may be allowed to be together.

Perhaps the most remarkable thing to the person previously unacquainted with pheasants and their habits is the fact that they will not live indoors as do chickens and other domestic fowl. Therefore, their houses should be made with walls on the east, west and north sides and with a roof, but the south side should be uncovered and open except that if one sees fit, the south side may be covered half way down with old window sash with the glass in them and plenty of perches should be placed in the house. To avoid rains and disagreeable winds, the birds will seek the house in daylight, but it is indeed very rarely that they will be found in the house at night. In the most inclement weather mine have slept out on the tops of snow banks. In the winter season of the year a feeding patch for them, if possible, should be made beneath undergrowth, or should be kept swept clean where they can come for feed.

Great care should be taken to avoid mites and lice with pheasants, whether young or old, and particularly with the young, and where it is deemed necessary they should be greased. The pheasant seems to be fairly free from disease, but occasionally a hard scaly substance like a wart or a corn grown on the legs, making the bird lame. Where that is found a little olive oil rubbed on them will cause them to fall off in a short time. If a pheasant should develop a cold, be very careful not to give it water,

except at long intervals.

These birds are insect exterminators. That constitutes a very large part of their food and as a consequence they are very beneficial in the garden. They do not dig up a garden like hens. Any person contemplating raising these birds should not be fearful that it is a difficult task or that he will not be successful. We have much better results with our pheasants than with any other fowl that we raise. In handling the pheasants, they should be caught with a scap net, for the reason that their legs are

very long and very liable to breakage and the chances are altogether too great of breaking their legs to make it wise to catch them in the hands or in any other way than with such a net.

The Ring Neck pheasant attains its fully plumage during its first year at from five to seven months. The female lays from 50 to 120 eggs per season. The eggs hatch in 24 days. The birds breed the spring following the year in which they are hatched, and one male will mate with from one to six hens. The Amherst attains full plumage in its second year, lays 30 to 40 eggs per season, breeds the first year if the young hen is mated with a two-yearold male. They mate one male with from one to three hens and the eggs hatch in 22 days. The Reeves attains its full plumage the first year, lays 35 to 40 eggs per season, breeds the second year, mates one male to not exceeding three heus and the eggs hatch in 25 days. The Golden gains its full plumage the second year, the eggs hatch in 21 days, it lays 25 to 35 eggs per season, and breeds the first year if an old male is mated with young hens. It mates one male to not exceeding five hens. The Silver attains its full plumage in the second year, lays 45 to 50 eggs per season, breeds the second year and mates in pairs. The eggs hatch in 27 days.

#### INCREASING THE SOIL'S FERTILITY.

Probably no subject connected with the field, farm or garden has been more written about or less definitely settled than that of soil enrichment, or "manuring," writes F. F. Rockwell in The Field. In a broad sense, anything added to the soil to increase its fertility may be termed a manure. While there are several different classes of such materials, the lines between them cannot be sharply and distinctly drawn, and the result is confusion of thought on the whole subject. To get the matter down to any practical basis for discussion, however, we must make distinctions, although they may be more or less arbitrary. The first general classification to make is that of organic in contradistinction to inorganic manures; that is, the animal or barnyard manures and green manures, as differentiated from chemical fertilizers. Here, however, we at once see the difficulty of making a hard and fast line, as manufactured organic manures, such as the slaughter-house products of ground bone, bone black, tankage, dried blood and so forth, in practical work are handled and applied with the chemical fertilizers, such as nitrate and potash salts and rock phosphates.

Omitting all questions of "why" and "how," which the scientists are still fighting out among themselves, the following principles are well enough established to have already served as a foundation for successful

soil improvement.

First—That plants derive their nourishment from the so-called plant-food elements in the soil. (The legumes being a partial exception, as through nitrogen gathering bacteria upon their roots, they have the capacity of deriving a large amount of nitrogen from the air.)

Second—That these plant-food elements must be in certain chemical conditions or combinations before the plant roots can absorb them, or before they are "available," as it is termed. And until these elements are converted by the chemical action constantly going on in the soil into available forms, they are of no more use to the plant than a cocoanut would be to a starving shipwrecked sailor if he were unable to break the shell.

Third—That by intelligent cultivation we can

hasten this process of converting unavailable plant food into available forms. This may be accomplished by maintaining proper conditions of air and moisture in the soil, through under-draining and surface cultivation to counteract the extremes of wet and dry weather; by improving the mechanical condition of the soil by breaking the soil particles up as fine as possible, and by adding chemical and bacteriological agents, such as lime and various classes of bacteria which take a direct and active part in preparing the raw plant food for the table to be set for the plants' feeding rootlets.

Fourth—That soils that have been under cultivation for a considerable time are likely to become depleted in one or more of the following elements: Nitrogen, phosphoric acid, potassium (or potash), and sometimes calcium (or lime). That when any one of these becomes deficient, the plant growth becomes checked and a superabundance of any of the other elements cannot make up for the shortage; but by adding to the soil these various elements, in the proportion needed, we can directly feed the plant.

With these principles fixed firmly in mind, we have a foundation upon which to go ahead and lay out a system of maintaining and increasing the fertility of our fields by making the best use of each of the several materials which are available for that purpose.

The most generally used of these available classes of material, which I have already briefly mentioned, are the several kinds of animal manures.

A hundred pounds of a high-grade, complete fertilizer contains more actual, available plant food than a ton of average manure; but you would go a long way to find any practical farmer or gardener who would prefer the former instead of the latter if he could have either delivered to him on the field at the same price. Some of the soil scientists of the last generation considered that this was merely prejudice on the part of the practical grower, whom they considered not ready to follow the lead of science. As a matter of fact, however-as is not infrequently the case-it was the practical man rather than the scientist who was in the lead. Because manure is valuable not only as a carrier of plant food, but also as a source of bacteriological action, a means of improving the physical condition of the soil, and for supplying humus, or the spongelike, water-absorbing vegetable matter which helped to maintain the supply of soil moisture. Without moisture all growth must cease, even in the richest soil. This water-holding humus is necessary to carry crops through a season's periods of deficient rainfall.

Our aim in handling animal manures should be to treat them in such a way that the plant foods which they contain are saved and converted in the most available forms possible, that bacteriological action will be promoted, and that the physical condition of the manure will be made such that it can be handled readily and will be of benefit to the physical condition of the soil. In addition to this, of course, it should be handled by a system involving the least possible trouble and expense. The best system of handling it, in any particular case, will depend upon how it is to be used and what kind it is. Manure that is allowed to ferment loses a great deal in bulk—in the case of ordinary mixed yard manure usually about one-half—and also usually about one-half of the nitrogen and potassium, and one-fourth of the phosphoric acid which it contains when fresh. If in addition to this it is exposed to the weather, still greater losses take place. as not only are the natural liquids lost, but a great

deal of the valuable elements of the more solid portions of it are washed out. The use of acid phosphate, ground phosphate rock, or gypsum, added to the manure as it is made, at the rate of forty pounds or more to each ton of manure, greatly reduces the loss of plant-food elements where the manure has to be kept some time before being used.

#### GROWING ROSE SEEDLINGS.\*

By John Cook, Maryland.

I will not go back to the history of the rose, as that will take too long. The magnitude of rose growing as compared to twenty-five or thirty years ago is surprising. All the Tea Roses at that time were lacking in color. Therefore, we used some of the hybrid perpetual roses as pollen bearers (they being richer in color). Through this operation we succeeded in getting deeper colors—reds and deep pinks.

Hybridizing is the art of bringing together individual flowers or plants of different species. Cross breeding effects similar results with individuals of the same species.

Growing rose seedlings is a very slow business. It takes five months to ripen the seed pod, a month to rot the hip and from five to twelve months for the seed to come up. These seedlings are very much subject to mildew, and some die in their infancy. Fifty per cent. of the seeds will not germinate, twenty-five per cent. will come single, and out of the remaining you might obtain two or three varieties worth growing.

By crossing them we call them Hybrid Teas.

In 1888 I raised the first hybrid tea seedling raised in the United States. It was a cross between Bon Selene and Louis Van Houte, which was in great demand for a number of years. (This was a red rose.) I named it "Souvenir of Wooten," after the country seat of George W. Childs, in Philadelphia, where he entertained the Society of American Florists so handsomely.

My next seedling was a beautiful pink rose, which I named "Mrs. Robert Garrett." This rose had a weak stem and was discarded for a commercial rose, but it is good for outdoors and can be found in the catalogues of Europe and this country. "Enchantress" was another shell pink rose grown to some extent under glass.

Then came Marion Dingee, a red bedding rose. (The entire stock of this rose was sold to Dingee and Conard,

who named it after their daughter.)

Then came Cardinal, a beautiful red rose, crossed with Liberty, and an unnamed seedling. This rose proved

one of the best hardy roses.

In 1908 I introduced Radiance, a rose pink with a silver lining to the petals. This is a seedling from Cardinal crossed with an unnamed pink seedling. This rose received a silver medal at the Hartford Test Gardens, and this, in my opinion, is the very best of all the Hybrid Tea Roses for out of doors. The demand for this rose is increasing every year. At the same time I introduced my Maryland, a salmon pink rose. This is one of the best commercial roses, as well as a hardy outdoor rose, a very profuse bloomer.

In 1914 I introduced Panama, a delicate tinted rose, with large petals, a very profuse bloomer, one of the best bedding roses. This also received a silver medal at the Hartford trial grounds in competition with French, Eng-

lish and American roses.

The last rose I sent out in 1914 is a beautiful red rose which I named "Francis Scott Key," after the author of the Star Spangled Banner, a seedling from Cardinal and an unnamed red seedling. This is the best built rose in cultivation. It has sixty petals.

I have raised thousands of seedlings, but the most of them were wanting, either in the production of flowers or hardiness. They were all given a trial out of doors, and most of them were killed by hard winters and therefore I did not propagate them to send out.

To have fine roses in the open ground it takes well rotted cow manure. It is the very best of all manures for roses. Dig the soil out about twenty inches deep, get some well rooted sod and mix it with one-quarter well rotted manure. This will give splendid results in the size as well as profusion of bloomers. Give them a top dressing of fine bone in July. This will carry them through the season.

There is something new and interesting to learn about rose growing every day. The care required is constant, and the old adage "Eternal Vigilance is the Price of Success" is perhaps more true of rose culture than of any

other branch of the grower's art.

#### FLOWERS AND BULBS AS FOOD.

Not long after the outbreak of the European war there was printed in the newspapers a dispatch to the effect that in Holland, whose industries were greatly crippled, many people were grinding tulip buds into flour and making bread from it.

Many people thought it a most unusual thing. As a matter of fact, most people have no idea how many blossoms, leaves, stalks, roots and bulbs of our flowering plants make good, wholesome and often really delicious food, writes E. L. Freking in *Vegetable Grower*.

Sweet pea blossoms make a good salad. The flowers have the base cut away, but not enough to cause the flower to fall apart. The blossoms may be combined with any delicate salad greens, or with fresh young pea sprouts, that is, pea shoots that are about two or three inches above the ground. These are delicious, and when used with the pea blossoms, make a very unusual salad.

The tiny flowers of the sweet alyssum make a tempting salad. The flavor of the flowers resembles that of turnips. They may be used with nuts and salad

greens.

Another favorite for salads in old-fashioned gardens is the gillyflower or stock. This flower belongs to the mustard family and both foliage and flowers are used in the making of salads. The leaves are strong and are best when chopped with nuts. They mingle well with peanuts and pecans. The flowers should be chopped.

The blossoms of the althea, or rose of Sharon, make a sweat, delicate salad. They are somewhat like holly-

hock blossoms, but sweeter.

The chrysanthemum is used more than any other flower in Japan in the making of salads. The petals are pulled from the flower and chopped with nuts and mixed with honey and oil and served either with or without salad greens. The petals have a peculiar flavor and make an excellent tonic, being slightly bitter.

The blossoms of all ornamental flowering beans make excellent material for salads. The scarlet runners, the wistaria bean and the hyacinth served steamed or stewed. To the northward, Oregon Indians make bread and porridge of the seed of a yellow flowered crucifer, which they grind into meal.

The wild lettuce blossom is more attractive to the palate than to the eye, but together with its young leaves it forms a pleasing and nutritious bean are all common to our gardens, and make a showy salad. They are sometimes mixed with nasturtium flowers

Verbena blossoms pulled whole from the flower head and served on nasturtium leaves with pecan nuts.

<sup>\*</sup>Paper read before Women's Nat'l Agric, & Hort, Conf. (See page 243.)

makes a most graceful and beautiful salad and have a very delicate flavor.

The blossoms of the red clover are used as salad. The tiny flowers are plucked from the blossom head and used by themselves with a salad dressing or with some of the clover leaves which have a sharp, peppery taste and are strongly nitrogenous and therefore excellent for the health.

In Florida the flowers of the banana plant are now being utilized as a food and they are also gathered and dried to use further north.

Alfalfa and dandelion flowers are in high favor as food. The alfalfa flowers are excellent for the health as they are so rich in organic salts. The alfalfa plant strikes its roots very deeply into the subsoil and brings up into the flower the richest supply of mineral elements, iron, sodium, potassium, sulphur and calcium. The flowers are also excellent for nervous troubles.

The tubers of flowers are cooked and made into very attractive dishes. For example, there is the small tuber of the tuberous nasturtium, which is very delicious either cooked or raw, and has a spicy flavor somewhat like a radish. The small bulbs may be eaten served like radishes or cooked in a variety of tempting ways, boiled saute, curried, fried or baked.

The tuber or bulb of the dahlia has been for some little time a favorite vegetable. These bulbs are delicious and may also be eaten either cooked or raw. For salad, sliced raw, they have a very agreeable taste, and cooked they furnish a novel and delectable dish.

The hollvhock is one of the flowers that serves for both raw and cooked dishes. It is of the mallow family and has "cheeses" as the seed cups are called when young. These cheeses are very rich and nutty in flavor and may be eaten raw as a salad or cooked and eaten with butter or cream sauce. The flowers of the hollyhock are used for salads and they are filled with natural salts. One may make a salad of the tender leaves, the seed buds and the petals of this flower. To make a hollyhock salad, gather the newly blown flowers and a number of the small seed cups. Strip the petals from the flowers and arrange them on a plate with the inside part of the seed cups scattered over them and serve with a French dressing. The flowers are dried in the Orient and make a very palatable food in winter, as the flavor is particularly delicious when the dried petals are moistened by chewing.

Marigolds make a pungent and tempting flower salad. The petals are pulled from the stems and chopped with flaked nuts and dressed with any favorite form of dressing. One with honey in it is particularly good. To make this salad select the largest flowers and mash them. Then strip off the deep gold petals, add half a cupful of chopped or flaked nuts of any kind to mix well together. Place in the center of a salad dish and garnish the edge with the whole flowers. A more beautiful dish would be hard to find. For the honey dressing use two parts olive oil, one part lemon juice and one quart clear strained honey, beat well together and add at the last the stiffly white of an egg. Salt to taste.

Pansy salad is excellent from a health point of view, for the pansy is a very wholesome herb. The flavor is like that of wintergreen. Both the foliage and flowers are used.

A very rich and succulent salad is made from white water lilies. The petals are pulled from the flower head and chopped. They are usually combined with grated nuts such as almonds or pignolias, and a salad dressing used with honey and oil, as described above, in it. A single perfect water lily blossom may be placed in the center of the dish of salad as it comes to the table.

#### THE AGRICULTURAL VALUE OF LIME.

In a report recently issued by the United States Geological Survey on the source, manufacture and use of lime, some very interesting and educational data is given on the use of lime as a fertilizer which embody the views on this subject of a number of our

most prominent agriculturists.

The report dealing with the subject of agricultural lime states that the use of lime as a fertilizer dates from the inception of modern scientific farming. Agricultural chemists have shown that there are five or six different functions which lime may perform to benefit a soil, which may be summarized briefly as follows: 1—It is an essential element of plant food. 2—It aids in the conversion of decaying organic matter into humus. 3 -It forms compounds with the humic acids which tend to prevent their being leached out of the soil and lost. 4—By producing proper sanitary conditions the growth of injurious bacteria is largely prevented, while the growth of nitrifying bacteria is encouraged. These nitrifying bacteria convert the nitrogen of the humus into a form such that it is available as a plant food. 5-Lime aids in the liberation of potash and phosphorus from inert compounds. 6—It tends to flocculate clay soils, rendering them granular and more porous.

Obviously, permanent results can not be expected unless care is taken to insure the presence of some organic fertilizer at all times. Lime used alone may be temporarily beneficial, but will eventually be harmful; when used with cowpea vines it becomes more efficient for general purposes than almost any other fertilizer. Of course, lime is not beneficial to all crops to

the same extent, and not all soils need lime.

Thus some of the common plants which are stated by this report to be benefited by lime are spinach, lettuce, beet, celery, onion, cucumber, cantaloupe, asparagus, cabbage, peanut, rhubarb, pea, pumpkin, bean, tobacco, alfalfa, clover, barley, wheat, oats, timothy, gooseberry, currant, orange, quince, and cherry. Indian corn is only slightly benefited. Plants which are said to be slightly injured by lime are cotton, tomato, cowpea, concord grape, peach, apple, and pear, and those really injured are radish, flax, blackberry, black raspberry and cranberry. Whether a soil will respond to liming or not depends on the amount of available calcium oxide which it already contains. Unfortunately chemical analysis does not distinguish between the total calcium oxide and that which is available to plants. Probably the best indication of the need of lime is the failure to obtain a good crop of

### IMPRESSIONS OF THE SAN FRANCISCO EXPOSITION.

By Chas. H. Totty, New Jersey.

The Exposition is in full swing, and it goes without saving that all the predictions of its sponsors are being carried out. It is a dream of beauty, and it seems hard to believe that two years ago much of the ground was a mud hole. The exhibits are in place, and there is an air of completeness about the exposition that has been lacking about some other similar affairs. The visitor will not dream as he looks about the grounds that all the beautiful scheme of acacias, eucalyptus, evpress and palms have been moved in boxes, and in fact are still growing in the boxes, forming as they do beautiful settings for the buildings. The Exposition is an artistic triumph, the beautifully tinted buildings conforming to a color scheme of subdued yellow, green and gray to brick red, and the landscape effects are arranged to harmonize with the rest of the picture. The Darwin tulips, which are just through blooming, were glorious—particularly in the Holland section.

At the present time the color note is yellow with millions of pansies and violas in bloom. This effect will be offset later by Begonia and other plants, and when the horticultural visitors arrive in August they will be charmed with the various and beautiful effects of the plans employed.

The hedges and the walls of Mesembryanthemum spectabile are one of the principal features of the horitcultural effects. This wall in many cases is over thirty feet in height, and when the sun is shining the effect of the open flowers is wonderful—at other times the dark restful green of the foliage blends with the color scheme.

The general effect on the visitors to this exposition is a restful one. There is not discordant clash of color, no aggressive glare. I noted some splendid sweet peas being grown in the Morse gardens which are not yet in flower.

The Massachusetts garden is getting into good shape, the Iris being very good and the Buddleias showing exceptional promise for the future. The Japanese exhibit is magnificent—it is hard to beat.

The new roses in competition for the thousand dollar prize are as yet in poor condition, although another rose exhibit in the California garden, by the Gill Nursery Company, shows the wonderful possibilities of this section as a rose growing center. Irish Elegance and Maman Cochet being wonderfully fine, their yellow flowers showing up with telling effect.

The placing of the large plants around the buildings is most artistically done, and the landscape effects as a whole have set a standard that future exhibitions will find hard to surpass.

The Avenue of Palms is composed of Phoenix Canadiensis, and while a wind storm of a few days ago has browned some of the leaves, we are assured that they will soon come back in this California climate. The stems of the palms are covered with Nasturtium to relieve the bareness and, lulled by the harmony of the whole ensemble, eliminate every discordant shade of color. Only varieties were used that would conform to the color scheme, even the midway concessions having to conform to the color scheme of the Exposition.

The rhododendrons and iris are just passing out of flower, and, as can be imagined, have contributed wonderfully by their brilliant coloring. The garden effects of the Japanese Commission, which are numerous and beautiful, are supplemented by large exhibits from Yokohama Nursery Company.

The visitor from the east is surprised at the cheapness of the cost of living in San Francisco, a fine room, with bath, being obtainable most everywhere for three dollars a day; and the prices of food range from thirty to fifty per cent, lower than in the east, particularly so in the case of fruit. The lower cost of living while here will offset the cost of the traveling expenses to a very great extent, and every gardener who misses this opportunity of seeing how great our country is, enjoying himself at the same time, and participating in the greatest event in the history of expositions will ever after regret it.

The San Francisco florists and horticulturists, with their proverbial hospitality, beg me to assure your readers that "the latch string is out," and they look for the greatest crowd of horticultural enthusiasts that ever got together. I could write for a week on the horticultural features of this state, but it would not convey anything to a man unless he had once seen the vegetation here, and I can only repeat: Come and see for yourself.

The illustration herewith shows the Aphine Mfg. Co.'s International Panama-Pacific Exposition silver and bronze bowling trophy to be awarded to the member of the Society of American Florists, National Association of Gar-

deners or American Association of Park Superintendents: making the highest individual score in the contest which will be held under the auspices of the Pacific Coast Horticultural Society, in San Francisco, the third week of August next, when the meetings of all the named organizations will occur in that city.

### Our Native Birds

This department is under the direction of the Committee on Bird Protection, National Association of Gardeners.

#### DO SOMETHING FOR OUR BIRDS.

BY ROBERT WHILLAMSON, CONNECTICUL.

Now is the time that all lovers of birds can do something to attract them to their grounds by planting various shrubs and trees or otherwise contributing to their protection and feeding next winter. The writer has for a number of years been quite an enthusiast on planting trees and shrubs for berry effect in autumn and hence unintentionally attracted many birds about the grounds and on more than one occasion regretted their depredations on some of our choicest plantings. The past year or two, however, he has experienced a change of heart towards our feathered friends and has come to look upon them more kindly as he realized the amount of work the birds do for us in destroying insect pests. It we can in time encourage enough birds to do the work which we are compelled to do each year in spraying our orchards and gardens, we will be doing our share to bring about a horticulturist's millennium. It has been computed that the annual damage from insects in the United States alone amounts to eight hundred million dollars. A statement which no doubt is true when one takes into consideration the amount of money spent in fighting pests as well as the actual damage done to crops.

A recent writer in the GARDENERS' CHRONICLE under the heading "Bird Protection and Its Scope" named a list of what to plant in the line of trees and shrubs to attract the birds which if carried out will work wonders in a very

iew years,

Protect your cultivated blackberries and raspberries by planting mulberries in the neighborhood of your fruit garden, for the birds prefer the mulberry. Every garden should also have a corner planted with a few sunflowers for many birds will feed on them in the fall.

Do not neglect to have a patch in some out of the way place planted with buckwheat, and you will find next fall and winter that patch will be a rendezvous for many a flock of quail as well as other birds, especially if this is done on large estates. If the winter is severe be sure to erect some shelter made out of corn stalks convenient to the buskwheat patch and when deep snow covers the ground be sure to place some buckwheat where the quail

can get it.

The common American crow is one of the greatest enemies of our smaller and interesting birds and while the writer admits that the crow in his way is a great help in destroying myriads of grubs in the field, it is, however, impossible to raise any kind of water fowl, quail or any birds which nest on the ground in a locality where crows abound, as they have a ravenous appetite for eggs. A good way "to fix" them is to feed them with eggs, taking the unfertile hens' eggs that have been tested out of an incubator, puncture a small hole in them, insert a small quantity of strychnine, stir it into the yolk and place the eggs where the crows are likely to find them—and they will soon "go home to roost."

#### WHY DO BIRDS MIGRATE?

Although North American birds living in the colder part of the continent return South for the winter, there is no similar movement of birds from the colder to the warmer parts of South America, according to a bulletin of the United States Department of Agriculture. If the birds in North America did not go South during the

winter, they would perish. Also if the birds remained in the South later than spring, there would be over-crowding; so they are drawn northward again by the enormous summer supply of bird food. In South America, on the contrary, there are almost no migratory land birds, because the South temperate latitudes, on account of their small area, offer no such inducements to the feathered inhabitants of the limitless forests along the Amazon.

There are some who argue that love of birthplace is the impulse which causes spring migration, and these call attention to the seeming impatience of the earliest arrivals. Ducks and geese push northward with the beginnings of open water so early, so far, and so fast that many are caught by late storms and wander disconsolately over frozen ponds and rivers, preferring to risk starvation rather than to retreat. The purple martins often arrive at their nesting boxes so prematurely that the cozy home becomes a tomb if a sleet storm sweeps their winged food from the air. The bluebird's cheery warble we welcome as a barbinger of spring, often only to find later a lifeless body in some shed or outbuilding where the bird sought shelter rather than to return to the sunny land so recently left.

As a matter of fact, however, only a small percentage of birds exhibit these preseasonal migration propensities. The great majority remain in the security of their winter homes until spring is so far advanced that the journey can be made easily and with comparatively slight danger; and they reach the nesting spot when a food supply is assured and all the conditions of weather and vegetation are favorable for beginning immediately the rearing of a family.

It may be safely stated that the weather in the winter home has nothing to do with starting birds on the spring migration, except in the case of a few. There is no appreciable change in temperature to warn the hundred or more species of our birds which visit South America in winter that it is time to migrate. It must be a force from within, a physiological change, warning them of the approach of the breeding season, that impels them to spread their wings for the long flight.

#### HOW TO ATTRACT THE BIRDS.

If you wish to attract the birds, the most important thing is to give them an abundance of water for bathing and drinking. Where water is not naturally abundant, shallow receptacles should be placed in suitable places for their accommodation, and the water should be changed daily.

These receptacles may take the form of an ornamental fountain, or may consist of shallow basins made of concrete, or pans of tin or galvanized iron. The water should not be more than 2 inches deep at any place; a thin stone may be laid in the pan to vary the depth.

Combined with suitable planting arrangement, such a little basin may be made an ornamental feature of the garden. Do not place the basin too close to shrubbery masses, where the cat may find a hiding place, as the birds are easily caught when wet. Exterminate every cat which makes a habit of killing birds.

Get in touch with the activities for bird protection in their respective States. Let us make the department on bird protection a live one.—L. P. Jensen, Missouri.

## The Season of the Daffodil

By The Onlooker.

A young lady to whom I spoke of the newer Daffodils seemed immensely surprised to learn that a single bulb of the particular variety we were examining cost five dollars. Her incredulity was not disguised; and it appeared to me that she thought the person who would pay five dollars for a tiny mite of a bulb was a fit subject for the mad house. She herself would assuredly buy a new hat—if \$5 would go so far as pay for her hat. And when she had it it would be cast aside in a few months, done with. My bulb, however, with luck and care, ought not only yield me two more equally good, and keep on adding to my stock year after year, while all the while supplying the daintiest, loveliest of flowers.

Too many gardeners and amateurs only know the common Daffodil, so frequently and erroneously called Jonquil. How often do we stop to consider that there are at least 200 excellent, distinct, and desirable varieties of Daffodils? These are all classified into groups and sections. Few flowers afford more interesting study. There are twelve sections, and the differences between these sections are based on the form of the flowers. Everybody knows the Paperwhite Narcissus, with small white flowers in bunches. Also we all know the Poet's Narcissus (N. poeticus) or Pheasant's-eye. Thirdly, everyone knows the true trumpet Daffodils of the Spring, the commonest and earliest being the old double yellow one, and almost in line with it the plebeian single trumpet kinds. These give us the key to how the classification runs. The genus or family used to be divided into:

1. Trumpet selfs; 2. Trumpet bicolors; 3. Poeticus; 4 Tazetta; 5. Incomparabilis; 6. Species.

But the crossbreeders and hybridizers have been at

But the crossbreeders and hybridizers have been at work for a long time and have considerably mixed up the original types; nevertheless the specialists who follow the work of the crossbreeders from year to year can usually "spot" the family characteristics that have been bred into the novelties. Herein is where so large a part of the interest and fun of the study of Daffodils lies. "Yes, I can plainly see the Johnstonii in that," one will say, "the trumpet shows me that." Or it may be a cyclamineus hybrid and bears the stamp of that species in the reflexing of its petals.

Well, these are crude enough examples, of course, but they serve to drive home the point. Both Johnstonii and cyclamineus are distinctive Narcissi; they have strongly marked characteristics. It is when we get down to the finer points that even the keenest experts have to get their thinking caps on and may not always guess at the correct parentage.

#### WORK OF THE HYBRIDIST.

What has this hybridization given us? This is a large question. It has given us noble white Daffodils where formerly frail-looking specific forms existed. It has given us much enlarged and finer varieties of N. poeticus. It has given us beautiful combinations of the Jonquil and true Daffodil. Hybridization has also resulted in the splendid new poetaz group, these being the outcome of crossing N. poeticus with the Tazetta or polyanthus (bunch) Daffodils, hence the name poet-az. Today we also have white Narcissi with the loveliest and daintiest green centers; and among the very latest are new, pink petalled seedlings.

An explanation of some of the terms used by Daffodil people seems in order here. First, then, all these flowers—Daffodils, Jonquils, Paperwhites—are members of one genus, the genus Narcissus. The name somehow or other comes down from ancient times and was the name of a youth of Greek mythology who admired his

own image reflected in the water, so ardently that Nemesis turned him into the flower that bears his name. The two terms, Daffodil and Narcissus, are used interchangeably, although some authorities aver that the term Daffodil must only be applied to those Narcissi that have long trumpets, or true trumpet Daffodils. Those with trumpets of half length, as in the well-known Sir Watkin, are also universally classed among the Daffodils, but here the line is often drawn and all other groups are simply called Narcissi. (The terminal "i" simply signifies the plural of the word Narcissus.) Familiarly N. poeticus is spoken of as Poet's Narciss, or Narcissus; the breeders and growers even speak of them simply as "Poets." Thus the experienced ones talk of Leedsii, Barrii, Engleheartii, for short, thus getting the variety down to its own proper group right away. Or if they don't wish to be quite so exact they will speak of "red caps," a term that needs no explanation from anyone; or of "chalice-cups," which means the Leedsii group.

#### DAFFODIL TERMS.

I have used the term petals as being best understood by the majority of flower lovers, but the Daffodil specialist calls these "perianth segments." It is a botanical point, but well worth adopting. Then the cup of the smaller type is properly or strictly the corona (crown); while the centre of the Poet's Narciss is the disc. The trade terms are therefore—perianth, trumpet, crown or corona, disc,

eve (the centremost part of flat flowers).

Whether the conditions for the highest cultivation of the Daffodil exist in any large part of the United States is an open question. I am inclined to think that, generally speaking, the sections where they succeed really well are limited to Oregon, Washington, parts of Michigan, northern Massachusetts and Maine. At the same time good vigorous varieties can be depended upon, if given reasonable care, in all sections north and east of Virginia, including that state. Plant early in October and cover the beds with a couple of inches of flaky manure after the first sharp frost. Choose a sunny, protected position for the finer varieties, such as in a border close to one's residence or between greenhouses, or having the protection of a wall on the north side, and if the soil is rich, well drained, and the bulbs sound when planted, excellent results can be expected. But while no stagnant water ought to lie about, remember that Daffodils enjoy a cool moist roothold.

Among the best kinds for planting in open woods or in glades or out among the shrubs in a holt or half wild shrubbery are these:

Telamonius plenus.
Von Sion.
Orange Phoenix.
Sulphur Phoenix.
Poeticus.

Incomparabilis Sir Watkin. Emperor. Empress. Frank Miles. Stella superba.

That is not a very long list, and could doubtless be added to easily enough. Among others for beds and for select places in the garden I would choose the following:

King Alfred.
Emperor and Empress.
Barri Conspicuus:
C. J. Backhouse.
Golden Spur.
Lucifer.
Gloria Mundi.
Beauty.
Duchess of Westminster.

Sir Watkin.
Victoria.
Mme. de Graaff.
White Lady.
Henry Irving.
Bernardino.
Blackwell.
Albatross.
Mrs. Langtry.

## The Month's Work—For June

Conducted by Henry Gibson, New York.

THE FLOWER GARDEN.

There is a good deal of routine work in this department at this season of the year. The early flowering perennials are furnishing fine material for cutting and by far the best results are obtained where the plants are relieved of the strain of carrying a heavy crop of flowers. When the supply of flowers exceeds the demand for cut flower purposes, the flower stems should be removed as soon as they show signs of fading. Freshen up the surface soil about the plants at frequent intervals, thereby checking the growth of weeds, and conserving the moisture in the soil.

Maintain a trim and neat appearance about the beds and borders by keeping the grass edges clipped regularly. As the early flowering bulbs, such as tulips, daffodils, etc., that are planted in the perennial garden pass out of flower and the foliage ripens, the space they occupy may be planted up with annuals. Planting out of bedding stock should also be pushed.

#### ROSES

Established roses are promising exceedingly well this year, and we look forward to seeing some fine exhibits at the spring shows. Where extra large blooms are wanted disbudding must be resorted to. Insect pests are sure to prove troublesome, and every effort should be made to keep them under control. Eternal vigilance is the price of freedom from bugs, flies, thrips, mildew, etc. If the plants can be regularly and thoroughly sprayed with a good force of water, very little poison or other chemicals will be required.

During cold, damp periods mildew is apt to be prevalent, but a good spraying with fungine, which is made up largely of sulphurated potash, is recommended for mildew. Liberal application of water during dry spells and frequent doses of liquid cow manure, not too strong, will greatly improve the quality of roses intended for the exhibition table.

#### SWEET PEAS.

Here again we have a subject that requires special attention in the way of suitable liquid feeding, and an important point to remember in feeding is not to give strong stimulants when the roots are dry. Give a good soaking of clean water and then use the manure. Cow manure mixed with soot is particularly good, though any kind of animal manure or commercial fertilizers can be used.

#### DAHLIAS.

Dormant tubers of dablias may be planted out any time now, but where late frosts are prevalent it would be well to delay the plantings of young green plants, that have been raised from seed or rooted cuttings, until all danger of frost is past.

#### PRUNING SHRUBS.

The early flowering shrubs require to be pruned as soon as they are through blooming. All spring blooming shrubs flower on wood make the previous year, and it is with the object of making provision for strong, clean, healthy growth that pruning should be done. This consists of cutting away as much of the old wood as is compatible the symmetrical development of the plants.

Among the shrubs that can be so dealt with at this season are almonds, lilacs, forthysias, spireas, snow-balls, etc.

THE VEGETABLE GARDEN.

Cultivating the early planted crops, giving support to peas and planting for succession will occupy the greater part of the vegetable gardener's time during this month. Potatoes will need to be earthed up and a sharp lookout kept for the potato beetle. Arsenate of lead or paris green are effective remedies. Late celery will need transplanting. Brussel sprouts and leeks should be planted. Egg plants, peppers, tomatoes, melons, cucumbers, etc., that have been hardening off in a frame may be set out.

Melons and cucumbers that were started early should be exposed to air all night, so as to gradually inure them to outside conditions. Hills should be prepared for these plants. We like to dig out a circular hole about three feet in diameter and two feet deep. In the bottom leaf soil and old manure is put to the depth of 15 inches and then the top soil replowed.

Cutworms are very partial to young melons, squash and cucumbers and a sharp lookout should be kept for them.

#### THE FRUIT GARDEN.

Small fruits will do better with a mulch applied this month. Early runners of strawberries should be prepared. Grape vines will require tying and disbudding and the summer pruning of fruit trees should not be overlooked. Many trees that are now unfruitful may be made to develop fruit spurs by judicious pinching of the young growth during the summer. The old idea of root pruning as being the only method of attaining this end is being exploded. Root pruning is a laborious operation at the best, and as practically the same object is attained by the simpler and pleasanter method of summer pruning it should not be overlooked.

Spraying of all kinds of fruit trees should be attended to. These notes are too brief to go into the details of each and every trouble that one has, to spray for, on the different kinds of trees. It is always good practice to look to these things at the proper time. Little good is done by adopting methods of control once the currant worm has defoliated the currant bushes. Black rot and mildew have become chronic on the grapes. Blister mite, canker worms, codling moth, black knot, leafspot and various other ills have ravaged the trees and young fruits.

#### THE GREENHOUSES.—ROSES.

The planting operations should be pushed ahead as fast as possible. When the old soil has been emptied out and the benches washed down with the hose, follow up with the white-wash while the bench is still wet. It is really surprising how much easeir it is. Four inches of soil is sufficient depth to plant roses in, and see to it that the coarser pieces of the sod go to the bottom next the straw or other material that is used to keep the drainage from clogging. Firm the soil well next the sides of the benches so as to avoid having holes left when the soil settles.

When setting the plants out in the bench previous to planting select the smallest for the front rows, the next largest in the second row and so on.

#### CHRYSANTHEMUM.

Getting the plants into their flowering pots is the chief work among these subjects at this season. Many of the earliest propagated ones have filled four-inch pots with roots, and the sooner they have a shift the better for their future welfare. Give ample drainage, use clean pots, a good compost and pot firmly.

#### HERE, THERE AND EVERYWHERE

#### PEDIGREE TREES AND PLANTS.

Among the catalogues that come to hand with the new year we find as usual, certain nurseries that make claims for better plants or trees, because they have been propagated from those of their kind which have shown the greatest and best fruiting capacity. Such claims appear very plausible to many readers and great trades have been worked up on the strength of them, but from the very first they have been condemned both by science and experience itself where the latter has been impartial. Nothing is more likely than that the buyer of nursery stock, who pays an extra price for supposedly better plants, should give them uncommonly good care, and to this extra care may be traced what he considers a confirmation of his belief. Had he planted ordinary sorts by the side of this so-called pedigree stock and given them exactly the same treatment, he would have discovered his error.

The plausibility of this claim made for pedigreed plants is derived from the analogy between vegetable and animal life that many of us are prone to assume; what holds true of livestock must therefore hold true of nursery stock. But when we look closer it is plain to see that there is no analogy at all, and that the cases are entirely different. Animals are improved by crossing or inbreeding and thereby securing new offspring that always differ in more or less degree from both parents. The pedigreed plants, on which we are asked to set a higher value, are merely replicas or duplications of the parent stock from which they are derived by means of coins, cuttings, layers or buds. In every case the young plant is merely a part taken from the body of a parent and therefore presents the same characteristics. The analogy to animal breeding in the plant world would be seed planting, but this wo do not do, because we should never get the same type but infinite variations, most of which would be inferior to their progenitors. The variations that we often think we have discovered in a variety are attributable to natural causes which we do not perceive.

At great intervals of time an arbitrary change in character, known as bud variation, may take place, due to we know not what. One of the best examples of this is the Pan-American strawberry, that was spontaneously produced by nature and was of a totally distinct type. It was found growing among ordinary plants and became the parent of all the fall or everbearing kinds that have since been originated. Thus nature was able to do at a stroke what man might never have been able to evolve through, scientific methods.—L. J. Johnson, in Market Grovers.

#### BE TENDER AND KIND TO PLANTS.

Botanists, plant pathologists and agronomists who follow the narrow and sometimes lonely paths of pure science may not be interested in Dr. Jagades Chuder Bose's "frictionless needle." a delicate instrument by means of which he determines whether plants are said or glad. Non-scientists, however, are likely to be thrilled by it.

According to Dr. Bose you may hurt the feelings of a plant just as you may hurt the feelings of a sensitive woman or child. You may bore plants and flowers by your dull presence or you may jolly them up by your sprightly manner. Be kind and charming to them and they will respond in kind. Be harsh, cruel and matter of fact and they will droop and die.

The discovery of the Hindu physicist is new only in that it pretends to analyze scientifically what has long been proclaimed as subtly inspired insight. Botanists with imagination have written voluminously for ages about the sensitiveness of plants and their seeming affection for those who tend them with loving kindness. Plant pathologists retort that plants respond to intelligent care that provides adequate nourishment and sunlight, wards off diseases and annihilates pests and parasites.—Country Gentl man.

#### HENRY RYECROFT'S GARDEN.

In among the chapters of introspection, imagining and careful loving dissertations on nature and some books, which form George Gissing's "The Private Papers of Henry Ryecroft." is to be found that individual's view of what a garden should be. The owner of "the plain little house" in Devon was a puzzle to his gardener because he resisted that "honest fellow's" attempts to "lay out flower beds in the usual way, and make the bit of ground in front of the house really neat and ornamental." What Henry Ryecroft liked in his garden were "quite old-fashioned roses, sunflowers, hollyhocks, lilies and so on, and these I like," he stated in his papers "to see growing as much as possible as if they were wild. Trim and symmetrical beds were my abhorrence,

and most of the flowers which are put into them." "But on the other hand," he says, "a garden is a garden, and I would not try to introduce into it the flowers which are my solace in lanes and fields. Foxgloves, for instance—it would pain me to see them thus transplanted. I think of foxgloves, for it is the moment of their glory. Yesterday I went to the lane which I visit every year at this time, the deep, rutty, cart-track, descending between banks covered with giant fronds of the polypodium, and overhung with wych-elm and hazel, to that cool, grassy nook where the noble flowers hang on stems all but my own height. Nowhere have I seen finer foxgloves. I suppose they rejoice me so because of early memories—to a child it is the most impressive of wild flowers. I would walk miles any day to see a fine cluster, as I would to see the shining of purple loosestrife by the water edge, or water lilies floiting upon the still depth."

Besides the old-fashioned flowers of his half wild garden, there are birds, and these are mentioned in one of his notes. He says, "All about my garden today the birds are loud. To say that the air is filled with their song gives no idea of the ceaseless piping, whistling, trilling, which at moments rings to heaven in a triumphant unison, a wild accord. Now and then I notice one of the smaller songsters who seems to strain his throat in a madly joyous endeavor to outcarol all the rest."—Monitor.

#### THE YEARLY COST OF GOLF.

We noticed recently the statement that golf costs Americans \$50,000,000 annually, an expenditure that represents 5 per cent, interest upon a billion dollars. It seems quite impossible that so much money could be expended upon one game alone. Yet figuring conservatively this estimate comes very near being right. It does not refer, of course, to what has already been expended in the purchase of land, the construction of courses and clubhouses which represent a probable investment to date of over \$100,000,000.

If we say that there are 2,000 golf clubs in the United States having an average playing membership of 200, which gives a total of 400,000 golfers, and allow an average of \$20 a day to each club in caddie fees, an expenditure of \$20 by each player a year upon clubs and balls, club dues averaging \$35, and labor \$3,000 per club, we arrive at a total of \$42,600,000. If there is added to this the purchase of seed, fertilizers and implements and other odds and ends the total will come very near to \$50,000,000.

#### CHINESE TREES DO WELL IN EASTERN NORTH AMERICA.

That the climate of eastern China is similar to that of eastern North America seems to be the reason for the success which has attended the introduction of many Chinese plants into this country; at least this is the opinion in the United States Department of Agriculture's Office of Foreign Seed and Plant Introduction. In a new publication of this office which lists seeds and plants imported during the fall of 1912 a definite report is given on the growth of 79 different importations from China, most of which may be termed successful. Plant introductions from foreign countries are distributed by the office until sufficient time has elapsed to give some indication of their possibilities in this country.

A maple which grows 70 feet high, whose leaves turn a golden yellow in autumn, is one of the ornamental trees introduced from China of which something may be expected. A Chinese elm particularly adapted for dry sections for wind-break purposes has proven very satisfactory and will be more generally introduced. A pine tree and a Chinese butternut also have grown well here. It is hoped that these all may prove as ornamental and useful as the gingko tree.

#### PROPOSED QUARANTINE FOR CHESTNUT BARK DISEASE.

The chestnut bark disease has become so serious that in the opinion of the United States department of Agriculture, it is desirable to quarantine New England, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, West Virginia, Ohio, North Carolina, Iowa and Nebraska, or such portions thereof as may be found to be essential. A public hearing on this question will be held in Washington at 10 o'clock on May 18. The proposed quarantine will restrict the movement from this territory of chestnut nursery stock and chestnut lumber with the bark on.

The chestnut bark disease is comparatively recent in this country. It is caused by a fungus which rapidly kills the native chestnut trees and is spread chiefly by the distribution of nursery stock. Once it has been established, however, it is spread locally by wind, birds, and insects. Migratory birds may also carry the disease for long distances.

At the present time the native chestnut grows in practically all of the territory east of the Mississippi except a section of the coastal plain of the Southern States, the northern half of Maine. and parts of Illinois and Michigan. For two years after the tree has been killed by the lungus the timber remains valuable, but deterioration sets in after that time.

#### INTELLIGENCE IN TREES.

It you watch a tree closely and study its habits your are surprised at its shrewdness in searching out its sustenance. It is almost as cuming as a rat in finding out good food and plenty of drink. I have even a cottonwood green and fresh in the dryest part of a dry summer have leaves of deepest green, putting out at the same time a vigorous growth, while a little beyond and all around were trees and shrubs badly wilted and suffering with the terrible heat.

What made the tree so fresh and vigorous? Two hundred feet away was a cistern, the tree found it out, sent its roots plowing through the hard earth to that cistern. It was a large one—had never failed before and the people wondered what became of the water. On examination it was found that the roots had gone down outside the brick and pushed their way through the cement and had carried the water 200 feet up to that tree. And the tree seemed to be crowing like a triumphant rooster over its victory.

Here is another illustration. I had a row of apple trees which of course are throwing out their roots for sustenance in every direction. Some distance from the row I had occasion to dig a trench and fill it with manure well mixed with earth for a row of pieplant. A year or two after I had occasion to dig out the trees and to my amazement I found those roots once headed in another direction had turned, some going under the trees and some beside them, the whole root system intent on getting to that trench. That was wonderful and shows a degree of intelligence worthy of the animal kingdom. What instinct guides that great army of foragers in their quest for food? Who told them of that trench that they made such haste to reach it? Thinking of these things you can almost claim relationship and clasping an out-reaching limb give it a good hearty shake, and say "How do you do my brother?" Liebange.

#### STEREOCHEMISTRY.

We are often at a loss to explain the behavior of certain plants. but if the theories of those scientists interested in stereochemistry are correct some at least may be explained by the molecular structure of their parts. Only three or four chemical elements are found in the majority of plant substances. For instance, such widely differing substances as starch and sugar, vinegar and alcohol, wood and oil, mucilage and wax, are composed of carbon, hydrogen and oxygen in varying amounts. Still more remarkable, it is known that the sugars, though made of exactly the same amounts of these elements, are very different in their effects and in their reactions with other substances. These differences are now believed to be due, not to different amounts of the elements composing them, but to the different way in which these elements may be arranged in the molecule. Miescher has estimated that the serum globule molecule may exist in a thousand million forms. Of the twelve known forms of glucose, only dextro forms (that is, those which rotate a beam of polarized light to the right), are fermentable or capable of being used by certain low organisms for food. In other substances the dextro forms may be untouched and other forms used. It thus appears that the structure of the molecule is of immense importance in the reaction of the organism or its parts and this may explain why one substance is poisonous when another exactly like it in composition is not, or why a substance may poison one organism and not another closely allied to it. By this theory may be explained the reason why the pollen grains of one plant will not germinate on the stigma of a related flower and why other plants more distantly related can be crossed with it. It depends largely upon the structure of the molecules of their protoplasm. Stereochemistry opens an inviting field for speculation and its further advances will doubtless be fertile in results. The American Rutanist

#### ENGLISH WALNUTS IN PENNSYLVANIA.

The English walnut is attracting wide interest in Pennsylvania as a commercial orchard tree. Scarcely a week goes by at the Pennsylvania State College without receiving inquiries concerning this nut. These inquiries are usually prompted by the fact that already within the State are bearing trees which have proved both their hardiness and their ability to bear abundant crops of nuts equal or superior to the nuts found in our Eastern markets, which are imported from the Old World, California or Oregon, the principal sources of our commercial supply.

Because of the interest manifested, the Department of Horticulture of the college has planned a thorough investigation of the subject. This will begin with a survey of the State to determine the location of all trees. In order to make this survey as complete as possible, the Department urgently requests the assistance of every one who can give facts concerning such trees, especially as to location, character of nuts, age of trees, hardiness, etc. Owners of nut trees are urgently requested to correspond with the college. It is hoped that this information will be sent in to the Department without delay, so that the trees may be visited by the investigators and fuller notes and observations made.

Whoever is growing such trees is invited to write to F. N. Fagan at State College, Pennsylvania, giving information both as to the trees and to the property upon which they are located,

#### GROWING WATERCRESS.

Anyone who has a constant supply, however small, of running water may grow watercress. A space larger or smaller, according to area at command, should be excavated so that under ordinary conditions the bottom may be covered with from 2 to 3 in, of water; but it is advisable to permit of cleaning the beds from time to time, to have some means of temporarily diverting or cutting off the water supply. The soil should consist of a very sandy loam or of tine gravel. Propagation is usually accomplished by division of the old roots or by sowing of seed. The best times for planting are in spring and the early fall. Plant the rows in the flow of the stream, not across it. Seed may be sown in pans of light soil in a greenhouse or frame, keeping it moist, and pricking the plants out into the beds when large enough to handle. Watercress may also be grown in any constantly-moist and shady spot in the garden, and in winter it may be obtained from pans or boxes kept in the greenhouse, giving plenty of water at all times. - Canadian Horticulturist.

#### MAKING A WHITE PINE BUSHY.

Everyone familiar with evergreens knows the habit of growth of the White Pine, Pinus Strobus, when in its favorite soil, a deep moist, but well drained one. It then makes a long, central shoot, each year's growth crowned with a tier of branches, with wide spaces between each tier. It makes height quickly and for this and its soft, silvery needles it has long maintained a place among the evergreens largely planted.

While many will say they want no improvement on its natural habit of growth, there can be no denial of the fact that a pruned, bushy White Pine is one of the loveliest of evergreens. It is then a specimen unlike any other in collections. It is true that the Himalayan has silvery foliage, but it is a more robust grower, easily distinguished from the White Pine.

There are two ways of making a White Pine bushy. One may leave the central shoot untouched, forming bushiness by nipping out the leaders of all side branches in early Spring, just as they are about to burst into growth. The other way is to top the leader in Spring as well as the side branches, looking to the formation of a bush-shape rather than that of a tall tree.—Exchange.

#### USE FOR WATER HYACINTH.

Consul Lawrence P. Briggs, who is stationed at Saigon, Cochin China, tells of some interesting experiments toward the commercial employment of water hyacinth.

"During the last four or five years" he says, "experiments have

"During the last four or five years" he says, "experiments have been carried on in the southern part of French Indo-China for the purpose of turning to some profit the water hyacinth, which incumbers the lower Mekong and other waters of Cochin China and Cambodia to such a degree that it has become a positive menace to navigation. The most extensive and successful of these experiments have been conducted in the Central Prison at Pnompelin, Cambodia, under the supervision of the director, M. Perrot. Hore the fibre produced by this plant has been used in the manufacture of rope, twine, matting, paddy sacks, boxes, and chairs, sofas, cradles and other articles of furniture. It has been mixed with silk to form a somewhat stiff but durable cloth,

"As soon as the plant is gathered it is stripped of its leaves and passed through a fibre crusher until the fibre is completely separated from the pulp. The fibre is then gradually dried in the shade. When carefully treated it is strong, flexible and elastic. Rope, textiles and furniture made of it, when treated with carbolineum, become impervious to the ravages of the weather or of the white ants and insects, so damaging to furniture in this locality. Tests show that a twine of this fibre having a diameter of 0.19685 of an inch and a length of 3.28 feet, will support a weight of 108.02 pounds, with a consequent prolongation of 3.937 inches."

Mr. Briggs also tells that hyacinth briquets equal coal as fuel. They can be marketed at about \$6, gold, per ton.

#### POSITION WANTED.

On private farm or estate by carpenter, married,  $3\frac{1}{2}$  years in last position, A-1 reference. Address P. O. Box 654, Suffern, N. Y.

## Hardy Ornamental Plants for Unfavorable City **Conditions**

By L. P. Jensen, Missouri.

Among the various ornamental properties in my charge, the Busch Place of St. Louis, Mo., is the smallest and the most difficult for the growing of hardy plants for naturalistic effect.

The Busch Place contains about five acres of land, all of which is utilized for ornamental purposes. It is located in a thickly-populated district, surrounded by buildings and factories, where the air is filled with smoke and soot.

THE TAST PRENDARY PLANTATION, SHOWING RESIDENCE OF MRS. ADOLPHUS BUSCH.

THE WEST BOUNDARY PLANTATION.

On account of this smoky atmosphere only the most hardy and vigorous plants can be grown successfully. Conifers are entirely out of the question, and have been discarded years ago. During more than twenty years almost all plants sold by nurserymen have been tried, and only those retained which have proven to be of a comparatively healthy growth and hardy.

The present list is small, but should prove of value to persons who have to do ornamental planting in similar

trying situations.

The pictures show the heavy mass plantations along the boundaries, which effectively shut out surrounding buildings, and the massed plantation throughout the grounds, which create a number of interesting vistas and give spaciousness to the place, without destroying the principal open lawn spaces.

Following is a list of the principal plants grown:

Acer dasycarpum, White or Silver Maple,

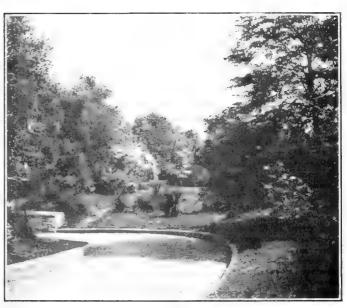

Acer dacycarpum var. Wierii, Wiers Cut-leaf Maple.

"Acer Negundo, Box Elder, Ash-leaved Maple, Assculus hippocastanum, Horse-chestmut.

\*Ailanthus glandulosa, Tree of Heaven. Aralia spinosa, Hercules Club.

\*Broussonetia papyrifera, Paper Mulberry.

Catalpa speciosa, Western Catalpa.

THE DRIVEWAY, SHOWING AN EFFECTIVE GROUPING AT THE ROADS BEND.

\*Cercis Canadensis, Red-bud.

Cratacaus occycantha, English Hawthorn.

\*Fraxinus, varieties, Ash.

\*Gymnocladus Canadensis, Kentucky Coffee-tree.

\*Halesia tetraptera, Silver-bell.

\*Koelreuteria paniculata, Varnish-tree.

\*Liquidambar styraciflua, Sweet-gum.

Liriodendron tulipifera, Tulip-tree.

\*Magnolia's all species hardy in this vicinity.

\*Morus, Tea's Weeping.

Persica, varieties of.

\*Platanus occidentalis, American Sycamore.

\*Platanus orientalis, European Sycamore.

\*Populus, varieties of, Poplar.

\*Robinia pseud-acacia, Black Locust. Taxodium distichum, Deciduous Cypress,

\*Tilia ulmifolia, Small-leaved Linden.

Ulmus Americana. American Elm.

Berberis vulgaris, Common Barberry.

\*Berberis Thunbergii, Thunbergs Barberry.

Cornus alba, Red-branched Dogwood.

Cornus stolinifera, Native Red-branched Dogwood,

Cornus stolinifera, var. flamiramia, Yellow-branched Dogwood.

\*Diervilla in variety, Weigelia.

\*Eleagnus longipes, Oleaster.

\*Forsythias in variety, Golden Bell. Often fails to bloom, but retained on account of their fine healthy foliage.

\*Hibiscus Syriacus, Althaca.

Hydrangea, hardy varieties. Kerria Japonica, Globe Flower.

\*Ligustrum all varieties, Privet, The privets are especially good as they retain their healthy green foliage till late in fall.

Ligustrum Regelianum is of particular graceful growth.

Philadelphus in variety, Mock Orange.

\*Ribes aureum, Missouri Currant.

Rhus glabra, typhina and aromatica, Sumachs,

\*Robinia hispida, Moss Locust.

\*Rosa rugosa, Japan Rose.

Spiraea van Houttei, Bridal Wreath. Blooms very seldom here, but retained on account of graceful growth and good foliage.

\*Syringa in variety, Lilac.

\*Tamarix in variety.

\*Viburnum opulus sterilis, Snowball. By far the most reliable flowering shrub for smoky situations, foliage good, always healthy.

\*Viburnum opulus, High-bush Cranberry.

\*Viburnum lantana, Wayfarers Tree.

\*Viburnum plicatum, Japan Snowball.

Viburnum lentago, Sheep-berry.

Yucca filamentosa and angustifolia do well.

Of hardy herbaceous perennials the following are best:

A LAWN VISTA FROM THE WEST BOUNDARY ENTIRE ESTATE
IS BUT FIVE ACRES.

Hardy Chrysanthemums, Lily of the Valley, Dictamnus fraxinela,

Dicentra spectabilis, German Iris in variety, herbaceous paconies and hardy lilies.

Named varieties of all classes of tulips and narcissus are used by the thousand in the borders, all flowering annuals and perennials being planted in masses against a background of foliage.

#### VINES AND CLIMBERS.

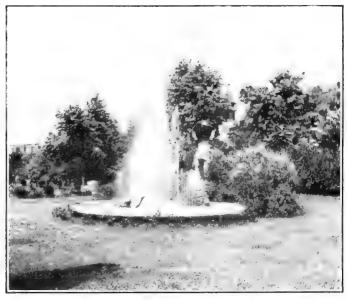

Ampelopsis, species of, Aristolochia sipho, Clematis paniculata. Rambler Roses, Wistaria and Lycium Chinense, Chinese Matrimony vine.

\*These plants have done remarkably well on the Busch Place.

#### PRAIRIE PLANTS.

When, as frequently happens, no rain falls for from thirty to sixty days or more in the growing season the effect on vegetation can be imagined. Cultivated crops often prove entire or partial failures unless the farmer anticipates the lack of moisture at the beginning of the season and holds the moisture in the soil by proper cultivation. Even in seasons of drouth, however, the wild plants seldom fail to make a crop. The compass plants, the sunflowers, the wild vervains and

many others remain fresh and green long after the grasses have become dry enough for prairie fires, but there is a noticeable lack of plants that flower and fruit at the height of the dry season. In these frequent drouths, we see one cause of prairies. Plants that require a fairly constant supply of moisture can not endure the conditions here and give up the struggle. Seedling trees, though doubtless often started, sooner or later find a season too dry for them. Thus the prairies are treeless except along the watercourses. The fires that still oc-

AN ELECTRIC FOUNTAIN WELL BACKLD BY SHRUBS AND TREES.

THE CHILDREN'S PLAYGROUND. NOTE PLANTING AT BASE AND BACKGROUND

casionally sweep across such areas are extremely harmful to all species that do not have some sort of a perennial stem underground. Prairies are like deserts in that the rainfall is unevenly distributed. There are no deserts in which some rain does not fall annually, while some deserts, at certain seasons are as flowery as any meadow. It is the long intervals between rainy seasons that cause the death of all but the most resistant plants. In the prairie region the drouths are of shorter duration but they are still long enough to eliminate many moisture-loving plants and to prevent the growth of trees.—. Imerican Botanist.

Secretary-Treasurer, ROLAND W. COTTERILL, Seattle, Wash.

JOHN McLAREN HERMAN MERKEL, New York, N. Y.

Vice-Presidents, CARL W. FOHN, JOHN HENDERSON, Colorado Springs, Colo, Montreal, Canada. CHARLES HAIBLE, Newburgh, N. Y. J. H. PROST, Chicago, Ill.

Vol. XIX.

MAY, 1915.

Xo. 5.

The May number ushers in two new departments to our publication—one on native bird protection, a subject in which garden enthusiasts and all nature lovers are showing keen interest; the other on ornamental fowl for parks and gardens, a new phase entering into the development of the modern garden. Our readers are cordially invited to contribute their experience or criticisms to these departments.

We call attention to the proposed campaign of the Committee on Bird Protection, of the National Association of Gardeners, published on the page following. The cooperation of all societies interested in ornithology, directly or indirectly, and civic bodies is sought by this committee in its work, which it is desirous to make nation wide, for

the protection of our native birds.

The report, appearing in another column, of the completeness and beauty of the San Francisco Exposition, sent to us by Chas. H. Totty, should stir the enthusiasm of every horticulturist and lead those so situated to do so to take advantage of the favorable opportunity to visit the Pacific Coast this year. The educational value of such a trip will well warrant the expenditure.

#### CLEVELAND'S FALL FLOWER SHOW.

Judging from the activities of The Ohio Horticultural Society, The Cleveland Garden Club and The Cleveland Florists' Club, during the past few weeks the Cleveland Flower Show, which will be held under their auspices November 10 to 14, 1915, is sure to develop into one of national interest and scope.

It has already been announced that the annual exhibition of the Chrysanthemum Society of America will be held in Cleveland and we are informed that the American Rose Society and also the American Carnation Society have been invited to conduct a Fall Exhibition in Cleveland in connection with the Cleveland Show. The invitation extended to the National Association of Gardeners will be acted on at the next meeting of the directors.

Mr. William Kleinheinz, president of the Chrysanthemum Society of America, states "the exhibition of our society, to be held in Cleveland this fall, will, no doubt, be the largest one we have held in recent years. From the standpoint of attendance we expect to break all records because of the central location of Cleveland."

The following executive committee will have charge of the show: Mr. S. P. Baldwin, representing the Ohio Horticultural Society; Mrs. L. Dean Holden, Mrs. A. S. Ingalls, Mrs. John É. Newell, representing the Cleveland Garden Club; Mr. Frank A. Friedley and Mr. H. P. Knoble, members of the Cleveland Florists' Club; Mr. S. Prentiss Baldwin is chairman; Mr. F. A. Friedley, secretary, and H. P. Knoble, general chairman of the show committee.

#### THE GROWER OF FLOWERS.

Obviously, the man who raises flowers is a better man than one who raises Cain, though he may be no better than one who raises cane. But, it seems to us, the man who raises flowers should be the happy man; a happier man than many a one who is engaged in other vocations. It should contribute to one's happiness to daily potter among plants and growing things; to pot and plant, and graft—in the only way that grafting is reputable—and to see his work continually glorified in endless reproductions. He can say, with truth: "Yes, Nature is the author, but I am Nature's servant and assistant; and, behold, what miracles we have together wrought!

The man who raises flowers should be a good as well as a happy man; for the happy man cannot be other than good. He lives with innocence and beauty. He saturates his soul with such colorings as no artist can place upon his palette; and he lives in an atmosphere of fragrance as sweet as the incense which rises before holy altars; more sweet, indeed, for it is fragrance fresh from the hands of God.

This man, who spends his days urging the soil to join with the sun and the breeze in the creation of beauty, must rejoice in the pure chastity of the lily and thrill, at times, in sympathy with the passion of the rose. He is so closely in touch with the microscopic tides of life, with the ardor of Nature's chemistry, that he cannot escape their influence if he would! and he would not if he could. If he be something of a poet, he may at times, in imagination at least, hear the tiny ripplings of the vital streams as they go singing along the mysterious avenues of leaf and stalk and bough.

It is a wonderful vocation, this flower culturing. There must be vastly more to it than the money one gets out of it. If ever there was a labor that one could easily love, and ought to love, it must be this labor which enables a man to conjure forth buds and blossoms of beauty.

—American Florist.

### NATIONAL ASSOCIATION OF GARDENERS

JOHN W. EVERITT, President, Glen Cove, N. Y.

OFFICIAL COMMUNICATIONS

M. C. EBEL, Secretary, Madison, N. J.

#### RECOMMENDATION TO CO-OPERATIVE COMMITTEE.

The local of operative committee of the Nassau County Horti cultural Society, (den Cove, N. Y., sumbits the following recommendation to the National Co-operative Committee. The plan will be submitted to all local horticultural societies at an early date for action. J. W. EVERITT,

Chairman National Co-operative Committee.

Your committee on co-operation having been instructed to present a draft of a plan on co-operation or affiliation of gardening societies with a view to creating a stronger feeling of goodfellowship energet members of such societies, beg to submit the following for consideration:

A number of a horticultural society, such as the Nassau County Horticultural Society, removing to another locality, and being desirous of associating himself with the horticultural society in the locality to which he has gone, should become eligible to full membership therein if he is in good standing, without the payment of dues to the end of the fiscal year, and vice versa. In other words, he would simply be transferred from one society to another without any extra monetary charge whatsoever.

It would make it so that a stranger could enter a society in his new location and, presenting a letter, or identification card, to the secretary of that society from the secretary of the society from which he was leaving, would be introduced to the members and made to feel at home.

Believing that this plan can be more widely circulated and carried out by the National Association of Gardeners, your committo reontained that this society refer the matter to that body, and if acceptable to them, to have the National Association of Gab. 2.218 cony out the plan.

Signed,

JOHN JOHNSTON. SAMUEL J. TREPESS. ERNEST WESTLAKE,

Committee.

#### REPORT OF THE COMMITTEE OF BIRD PROTECTION,

Your committee on bird protection has decided on the following method of carrying out an active campaign:

1. To request the members of the association and readers of the CALOSNERS' CHRONICLE OF AMERICA, to submit articles on bir' or testion for publication in the GARDENERS' CHRONICLL, and to enleavor to have these articles republished in other horticultural and agricultural periodicals.

2.—To keep in touch with the work of the various Audubon societies, State Experimental Stations, The Bureau of Biological Survey, of the U.S. Department of Agriculture and other authoritative sources of activity for the protection of our native birds.

3. To digest the information thus obtained, and incorporate in future reports.

4.-To keep in touch with the literature on this subject and advise members of future publications of value.

5. To also ate the adoption of a "Bird Day," in connection with "Arter Pay."

6. To work to the adoption of a systematic state effort of educating the public, and particularly the children, in the economic value of bind protection.

7.—To assist in the effort of having cities create the office of "City Ornithologist," for the protection of birds in cities.

runnier of the National Association of Gardeners is requested to communicate freely with the chairman of this committee, on anything pertaining to this subject, as your committee needs your individual assistance and suggestions.

Respectfully submitted. The Committee on Bird Protection. L. P. JENSEN, Chairman, Busch Place, St. Louis, Mo.

Dr. V(x,y) W. Henshaw, Chief of the Bureau of Biological Survey,  $V_{ij}$  S. Department of Agriculture, Washington, D. C., informs me that he will be glad to send copies of the following publications to any of our members interested in bird protection: "Bird Houses and How to Build Them."

"Some Common Birds Useful to the Farmer."

"How to Attract Birds in the Northeastern States."

"A Preliminary Census of Birds."

L. P. JENSEN.

The following invitation comes to us from the chairman of the executive committee of the Cleveland Flower Show to be held in that city November 10 to 14, 1915; Mr. M. C. Ebill. Secretary.

National Association of Gardeners. Madison, V. J.

Dear Sir.

You will be interested to learn that the Cleveland Flower Show, to be held November 10 to 14, will be the only large show of national interest to be held this fall.

Our executive committee voted to extend an invitation to the National Association of Gardeners, to hold a fall exhibition in connection with and to be a part of the Chereland Flower Show,

A copy of the advance premium list was mailed to non some time ago. It you think it necessary to enlarge the schedule by adding special classes and premiums, our committee will be very glad to receive suggestions from you to that effect.

We wish that you would extend an invitation to your members at your next meeting to attend the Cleveland Show, whether they exhibit or not. We are planning to entertain the largest number of private and commercial growers, retail and wholesale dealers and supply men, ever brought together at a fall show.

As you know, the national convention and exhibition of the Chrysanthemum Society of America will be a part of our show.

We thank you for your interest and the co-operation we feel sure we will receive from The National Association of Gardeners.

S. PRENTISS BALDWIN, Chairman Executive Committee.

### AMONG THE GARDENERS

Peter Morrison recently resigned his position as superintendent of the Arthur H. Scribner estate, Mt. Kisco, N. Y., to accept a similar position at Cedar Crest, the estate of R. H. Ingersoll, Oyster Bay, N. Y.

Berthold Frosch, who has supervision of the improvement work on the Andrew W. Mellon estate, Squirrel Hill, Pittsburgh, Pa., will shortly begin the building of a new range of greenhouses.

George H. Hale, formerly superintendent of the E. T. Adams estate, Rumsen, N. J., has accepted the position of manager of the Session Greenhouses, Bristol, Conn.

George B. Anderson, formerly of Hillburn, Rockland County, N. Y., has secured the position of gardener on the estate of C. B. MacDonald, Southampton, L. I.

David S. Miller, superintendent of "Kincraig," the estate of C. D. Mason, of Tuxedo Park, N. Y., resigns his position on June 1 to accept the position of superintendent of the new estate of J. Insley Blair, also located at Tuxedo. This is a new place of over ninety acres and will take several years to develop,

Duncan MacGregor, foreman for a number of years of "Kinunder Mr. David Miller, will succeed him as superintendcraig.

Felix Wood, late superintendent to Mrs. William Arnold, Babylon, L. I., has accepted the position of gardener to Mrs. A. J. Moulton, Llewellyn Park, Orange, N. J., succeeding Arthur Jackson, who recently resigned.

Roy H. Caverly recently resigned his position as gardener to C. H. Traiser, Clifton, Mass., to accept a similar position with Clemance A. Heass, Milton, Mass

Percy E. Hicks, who succeeded Wm. Turner as superintendent of the B. H. Borden estate, Oceanic, N. J., has resigned his po-

Frank Honneyman, superintendent of the Percy Chubb estate, Glen Cove, N. Y., leaves that estate to accept the superintendency of the Borden estate, Oceanic, N. J.

Frank Jones, for some years foreman on the Percy Chubb estate, Glen Cov. N. Y., succeeds Mr. Honneyman as superintends ert.

### AMERICAN ASSOCIATION OF PARK SUPERINTENDENTS

OFFICIAL COMMUNICATIONS.

G. X. AMRHYN, Pres., New Haven, Conn.

R. W. COTTERILL, Sec.-Treas., Seattle, Washington.

#### ASSOCIATION NOTES.

With committees appointed as announced in last issue, arrangements are well under way for our annual convention in San Francisco, August 18.

Herman Merkel, chairman of the transportation committee, is a live wire when he gets to work and he is determined to make the special party a success, and indications are that the attendance at this year's convention will break all records. Various cities along the route are already at work on plans for entertainment and the trip will simply be one continual round of pleasure and instruction. Secretary Cotterill is planning to go to San Francisco in June and confer with Chairman McLaren, of the Convention Committee, and the local committee at San Francisco, regarding details of all arrangements, program, halls, hotels, tours, etc., so that complete detailed information can be sent to all members by July 1 at latest.

There are a few members who have not as yet paid their dues for the current year, and the secretary wishes to urge these members to remit at once, so that we may have funds in hand to carry forward our work without going in debt. It costs no more to pay dues now than to pay them at the convention, and it will avoid the accumulation of unpaid bills as has been the custom heretofore. The Association right now does not owe a cent, and your officers are anxious to keep it in this condition. If you are one of the delinquents, send in a check right now.

The Association needs more members in order to provide sufficient funds to properly carry on its work, and members are urged to bear this in mind and secure as many new members as possible for the San Francisco session. There are surely men in your section of the country eligible for membership in the Association. Talk to them, write to them, or send names and addresses to the secretary, and he will correspond with them, send application blanks and extend convention invitation, etc. The secretary promises to help on any prospects forwarded and himself will have five applications for membership at the next session. Who will do the same?

Through our member, L. P. Jenson, superintendent of Grounds at Busch Place, at St. Louis, an invitation has been extended to our Association, in connection with its San Francisco convention, to visit Busch Gardens, at Pasadena, near Los Angeles. The Busch sunken gardens and parks have a national reputation and the invitation should be taken advantage of.

#### PARK DEPARTMENT PERSONALS

Dwight P. Davis, who recently retired as Commissioner of Parks of St. Louis, after many years of efficient service, was tendered a farewell banquet by 300 members of the St. Louis Park Department Employes Association.

A "Smoker" followed the dinner, speeches eulogizing the work of Mr. Davis were made by various city officials, and a beautiful bound volume testimonial, setting forth the innovations and improvements introduced by Mr. Davis, was presented to him by his employes.

Mr. Davis will be succeeded by Mr. Nelson Cunliffe.

Frank Brubeck, formerly superintendent at Terre Haute, Indiana, who lost out on account of political changes and entered the U. S. Revenue Service, has received a promotion to the position of General Travelling Deputy for the states of Indiana and Michigan. Mr. Brubeck, however still has hopes of returning to park work, and is merely awaiting the right opportunity.

John D. McEwen, superintendent of Queens Borough Park Department, New York, has been nominated for membership in the Association by Frank Hamilton, of Bronx Park Department. Mr. McEwen and his wife are planning to attend the San Francisco convention.

Chas. G. Carpenter, superintendent at Milwaukee, and for many years one of our most active members, it seems, has been confined to his home seriously ill since last July, but hopes to resume his

duties in the near future, his place having been held open for him by the Milwaukee Park Board.

This belated information comes to the secretary from an indirect source, and explains why Mr. Carpenter was not with us at the New York convention.

Herman H. Beyer, formerly an active member of the Association, while superintendent at South Bend, Indiana, is now located at Michigan City, Indiana, where he serves as superintendent of parks and is also in business as a landscape architect. Mr. Beyer will probably attend the August convention, and affiliate again with the Association.

Emil T. Mische, of Portland, Oregon, and one of the "war horses" of the Association, is so pleased over the convention coming to the Pacific Coast that he promises to have five new members for the convention. This is the right spirit, as we certainly should have more members.

The annual report of R. Brooke Maxwell, City Forester of Baltimore, and a member of our Association, is an interesting document. Baltimore is handling the street tree problem in a practical way, a feature which is, unfortunately, not given the attention it deserves by most cities.

The writer visited Baltimore last August, and was much impressed with the beautiful planting and floral display in street parkings and squares, which excelled those of any other of ten or twelve cities visited.

Messrs, Manning and Maxwell have producel results which are a credit to Baltimore and a shining example to other cities.

"Parks and Parkways of Bronx Borough," is the title of a booklet recently issued by the Bronx Board of Trade, and in the judgment of the writer, it is the best publication yet sent out from the metropolis, on the subject of New York park administration. The usual official New York publications are massive documents, with extensive detail and a mass of statistics, but this little booklet is quite compact, is attractively arranged and illustrated, and contains more valuable information, both from the standpoint of the local citizen or the outside observer, than all other publications combined. It is rather unique in that it is evidently issued by a commercial organization, yet it contains just the sort of information one should find in an official report. If you received a copy look it over carefully and you will find that it is out of the ordinary and is the finest kind of a model for a comprehensive and useful annual report. If you do not get one, send to the Bronx Board of Trade and get this valuable booklet for your files.

Members from the eastern and middle western states who contemplate attending the summer meeting at San Francisco in August, should place themselves in communication with Mr. Herman Merkel, so that he can give them full particulars and information on the plans of the California party, which will leave New York on August 5, Chicago 6. An itinerary of the trip, giving full details of the route, cities to be visited, rates, etc., is now in the printers' hands, and will be ready for distribution in a few days.

#### POSTPONING THE FLOWERING OF SHRUBS.

Since the use of the cold storage houses has become a feature with so many nurserymen, it has opened a way to having shrubs in flower at seasons differing from their natural one, which often is desirable. Many florists in cities have calls for cut flowers in summer which are quite out of season, but which late planting makes feasible. Hydrangeas, both paniculata grandiflora and arborescens grandiflora, represent two such shrubs, their large panicles of flowers being so useful to the florist. When in cold storage or even when heeled in in a cool place outdoors, their planting can be delayed a long time, and a delay of a month or so in planting in spring brings them in flower that much later in summer. Though the practice is not yet general, there are many who follow it, and much to their profit. Besides the hydrangeas there are other shrubs that could be used, and even putting aside the commercial view of this late planting, many a gardener would give much pleasure to his employer by so managing some of his shrubs to have them in bloom at a desirable time.

## The Parks of Los Angeles

By Laurie Davidson Cox\*.

The student of park development will find amidst the wealth of park interest on the Pacific Coast not the least of his surprises in southern California.

Los Angeles is better known, perhaps, in the East than any of the coast cities because of her equitable climate, and although she is far behind her sister cities-Seattle and Portland—in the development of a comprehensive park system, she has much of interest for the park enthusiast in her individual park areas. Especially is this true as regards the wealth of horticultural effects. Probably nowhere in America will such a variety of tropical, semi-tropical and temperate plants be found to the area and number of parks for many years; the existing neighborhood parks, which had largely been developed when Los Angeles was a comparatively small city, had not kept pace with the growth of the city in the dignity or metropolitan quality of their design and development; while Griffith Park, the city's mountain reservation of 3,000 acres and the greatest of her park treasures, was totally neglected.

With the advent of the present park commission, some four or five years ago, a vigorous campaign for park improvement was inaugurated and the results, in spite of the small funds available, are already apparent,

and some six months or more ago comprehensive plans for a municipal and metropolitan park system were prepared by the author.

The city of Los Angeles contains some twenty-five parks, the total areas of which is approximately 4,090 acres, three quarters of which lie in Griffith Park, a mountain reservation. The most recent inventory of the department shows real estate, buildings,

equipment and supplies valued at more

CENTRAL SOUARE, ONE OF THE MOST

growing side by side in a public park.

This very wealth of horticultural detail is to blame for the slowness with which the people of Los Angeles have come to appreciate good landscape design and the need for a model and comprehensive system of parks. The city has, however, awakened to this need at last and is today in the process of securing a thoroughly model system of park development.

The city of Los Angeles is particularly fortunate in possessing a large number of widely distributed park areas, all of diverse topography and scenic possibilities, instead of having her main park development concentrated in a single large area as is the case of her neighboring cities of San Francisco and San Diego. This distribution of the park areas makes them very accessible to the public and it is doubtful if there is a city in America where the parks are so generally and constantly used as in Los Angeles. This constant use is an inevitable result of a climate which causes the parks to be attractive and habitable nearly every day in the year.

It is only in the last few years that the present conception of a comprehensive park system for Los Angeles has taken form. Previously there had been little addition

THE AUTOMATIC SPRINKLING SYSTEM, ORIGINATING IN CENTRAL SQUARE, HAS BEEN INSTALLED IN HUNDREDS OF PLACES ALL OVER THE COUNTRY.

than \$9,000,000. During five years of the regime of the present park administration the annual expenditures for parks has nearly doubled. During the present fiscal year the city spent \$313,168, approximately \$1,000 per day for each working day of the year.

Maintenance is continuous throughout the year in the climate of southern California and the park department employs 250 men and 100 head of stock and owns much rolling stock and machinery. The department also owns and operates two fertilizer plants, which manufacture yearly 8,000 tons of fertilizer from refuse which the department receives free. It also operates a nursery which propagates about 500,000 plants and trees annually; it maintains a permanent, well organized construction force of skilled mechanics and artisans, and all building and construction work of every kind formerly done by private contract, is performed by this force. So great is the

<sup>\*</sup>Landscape Assistant of the Los Angeles Park Department, 1911-1914.

LAKE IN TASTLAKE PARS, SHOWING THE MAGNIFICENT ENCALYPTIS TREES ALONG THE SHORE, FOR WHICH THIS PARK IS NOTED.

saving effected that the park department, almost continuously throughout the year is called on to perform construction work for other city departments.

In all its work the department maintains an accurate cost accounting system, all work being carefully estimated and performed according to and the final cost checked against, approved work orders. An exact system of apportioning maintenance and standardizing labor units has been worked out so that a large saving has been effected in maintenance costs, which saving has been applied to permanent improvements.

Of the total expenditure for the year 1912-13, 57 per cent, went into permanent improvements, as against an average of 13 per cent, previous to the regime of the present park organization. With the increase of expenditure as mentioned above and this proportion of description it can be seen how the city has been able to make much progress in park development in the past few years even without park bond issues so common in many cities.

The larger and more important parks of Los Angeles with their acreage are as follows:

.\cres	Acres.
Griffith Park3.015	Hollenbeck Park 20
Elysian Park 748	
Exposition Park 117	
Eastlake Park 45	Sunset Park 11
Westlake Park 32	Central Square 5
Echo Park 29	

In addition to these there are fourteen minor parks ranging in size from a city lot to an area of several acres.

Probably the best known park in Los Angeles is Central Square, located at Olive and Sixth streets. With its fountain, evergreen lawns and splendid specimens of tropical trees it forms one of the most beautiful formal squares in America. It is situated in the heart of the business district and is the only park area lying within the downtown section of the city. The reconstruction of this park from a run-down village park to a dignified city square was among the first large pieces of work performed by the present park commission. In 1911 the park was entirely resoiled, redesigned and reconstructed at a cost of \$32,000, including an \$11,000 underground comfort station as fine as is to be found in any city in the United States.

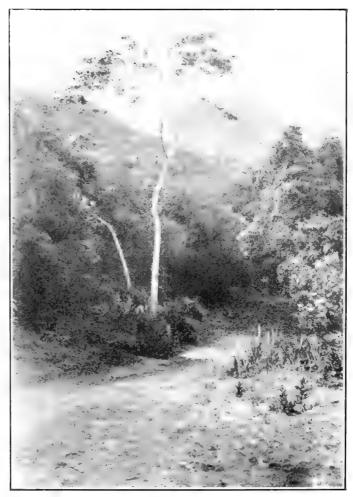

The five acres which comprise this park are worth, ac-

cording to current values of adjacent real estate, more than five millions of dollars, so that this little park is the most valuable park holding of the city.

Central Square has a great deal of historical interest. It is the oldest of the city parks and was a portion of the original grant to the pueblo of Los Angeles by Charles II of Spain in 1781. There is a monument in the park to the soldiers who fell in the war with Spain and near this is a bronze cannon captured at Santiago de Cuba, July 17, 1898. This cannon was made at Douay, France, in 1751, during the reign of Louis XV, for the French navy. It bears the sea emblems of naval guns and also the lilies and armorial bearings of the Bourbons. It also is inscribed with two mottoes in Latin meaning "the last argument of kings" and "A worthy adversary for many foes." The cannon was probably left in Spain by Napoleon's retreating army in 1813 and later taken by the

Spaniards to Cuba.

Exposition Park, which is being constructed through the joint efforts of the city, county and state, will be, when completed, one of the finest formal parks in America and easily the most elaborate park of similar area in the west. The county art and natural history museum with its world famous collection of prehistoric skeletons discovered in the La Brea oil beds is located in

THE FAMOUS BRIDAL TRAIL IN GRIFFITH PARK

this park. Here is the state exposition building where all forms of California products are exhibited and for whose maintenance the state appropriates \$30,000 a year. The state armory recently completed at a cost of \$250,000 is also located in this park.

The park contains a very fine mile race track, surrounding a twenty acre playground and athletic field. In addition to several football and baseball fields and a large range of tennis courts, this area is to contain a sunken concrete stadium for the holding of all forms of athletic games. A \$60,000 steel and concrete grandstand, a private gift, was recently erected by the park department on this track and a large club house and locker building with an outdoor swimming pool in connection is soon to be constructed.

The stables in connection with the race track are situated in the rear of the park and have accommodations for 200 horses. They are nearly always filled with thoroughbred race horses which may be seen in action every day in the year. Many prominent horsemen bring their racing stables to Los Angeles for the winter months.

The most striking feature of Exposition Park is the

architectural effect secured by the arrangement of the above mentioned buildings, which are all the same material and style and all of great architectural beauty. They are grouped about three sides of a quadrangle which contains a nine acre sunken gar-den. In the center of this garden is to be located the memorial fountain commemorating the completion of the Los Angeles aqueduct.

Eastlake Park is the largest of the intown parks of

Los Angeles and is one of the finest neighborhood parks in the country and by far the most popular and most used park in the city. At this park are held the great state picnics for which Los Angeles is famous, as many as 30,000 people often attending a single picnic here.

This park during the past three years has been in the process of a complete reconstruction and the work has been but recently completed. Eastlake is among the oldest of the city parks and the magnificent specimen trees with the great areas of lawn give to this park a charm perhaps greater than that of any other park in the city, certainly nowhere else in southern California can such an expanse of rolling lawns be seen. The park contains a fair sized lake, where boating is enjoyed by large numbers. A feature of the recent improvement has been the erection of a brick boat house and bandstand with an extending pergola pavilion encircling a large music court.

Eastlake Park has contained for many years the city conservatories and greenhouses and a complete new plant has recently been finished to replace the old buildings which were falling into decay. This new range of conservatories has been three years in building. It is com-

posed entirely of fireproof materials and will be practically indestructible. The ten sections of the building form one of the finest ranges of conservatories in the country, the largest public one west of Chicago and St. Louis. This conservatory has been designed and built by the park department with its own forces and at a cost of approximately \$90,000, some \$40,000 below the lowest contractor's estimate.

The park contains also a recently erected Carousel, or Merry-go-round, costing some \$20,000. A range of tennis courts and an outdoor swimming pool with surrounding shelter and pergolas to be built within the coming year completes the amusement features of the park.

Griffith Park with its area of 3,015 acres, the largest of the city park areas, is the third largest municipal park in America, being exceeded in size only by Fairmount Park in Philadelphia and the Blue Hills Reservation of Boston. The scenery in Griffith Park is probably more varied than can be found in any other city park in the United States and includes high mountains, deep canyons, open meadows and heavily wooded river bottoms. From the roads and trails splendid views are obtained also of the

distant mountains on one hand and of the sea on the other. There are forests here of native trees of large size, and the shrubs and flowers native to southern California are found in abundance.

The work of developing this park was begun four years ago and a great deal already has been accomplished. Some 14 miles of road have been built and the park department at present is cutting three miles of additional roadway through the mountains on the south-

SAN PEDRO PLAZA, OVERLOOKING FOS ANGLEUS HARBOR

ern side of the park. The new road will connect with the portion already complete and form a fifteen-mile circuit of the park completing what is to be known as "El Camino Felix" (the Happy Road) destined to be one of the most scenic park drives in America. In addition to the roads, five miles of bridle trails and several miles of foot trails have been opened, while numerous picnic grounds, supplied with tables, seats, cooking furnaces and drinking water have been constructed. A complete water system has been installed with reservoirs, pumping plants and many miles of main and supply pipes furnishing water to every section of the Park and greatly increasing the protecting against the fire damages so dreaded in the dry season.

A beginning has been made in this park of what is destined to be a great open air zoo, with animals kept as nearly as possible under natural conditions. A permanent range of bear dens is completed and a number of temporary cages and corrals have been built to house the large collection of animals formerly kept in Eastlake Park.

This year a range of lion dens in which there will be no bars between the lions and the spectators is being con-

structed similar to that of the famous Hagenbeck zoo in Europe. Even in its earlier stages as at present the outdoor Griffith zoo is one of the most interesting sights in

Los Angeles.

One of the features planned for Griffith Park is a free people's country club. This will consist of a large and well appointed club house with adjacent athletic grounds, tennis court, golf course and open air swimming pool. All these will be entirely free to the public. The golf course was recently completed and is now in full operation. It furnishes an interesting and sporty eighteen hole course, one of the best in California.

Besides the parks already mentioned, several other parks offer varied attractions to the visitor, each with its individual interest and charm. Echo Park contains the largest of the park lakes, and claims many with its splendid boating and canoeing facilities. Sycamore Grove with its shady groves of giant sycamores and the neighboring wild scenery of the Arroyo Seco is especially

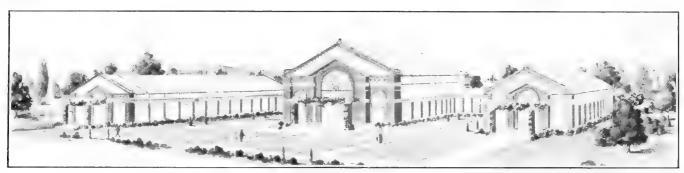

popular with picnickers.

Many of the parks contain tennis courts, Sunset, South and Sycamore being the most important. Hollenbeck Park shares with Echo in boating popularity and is the real canoe resort of the city. A very attractive stone boathouse and refractory has recently been completed here. Westlake Park, which lies in the heart of the hotel district, is widely known and is one of the oldest city parks. It has a large lake much used for boating and canoeing. Westlake is the least attractive of the city's parks as it has not yet been reconstructed. It is a wonderful example of the chaos and confusion into which a park will grow if allowed to develop by piece meal edition through a great many years of successive and changing park administration, when there is no definite and constant plan to follow. It contains, however, a great wealth of horticultural detail of much interest.

The San Pedro plaza, which lies along the bluffs above the city's harbor at San Pedro, is perhaps the most unique park in the city. The view from this park over the busy shipping of the harbor of a great city is one not often to be enjoyed from the vantage point of a green lawn under the shade of splendid trees. This park has been recently reconstructed, graded and planted and is provided with shady walks, broad stone seats and a charming stone rest-

house and overlook.

A project proposed in the plans for a comprehensive park system mentioned above is at present before the city. This project looks to the acquisition of two parkways in the Silver Lake and Arroyo Seco valleys. The land for these parkways is being condemned and when secured and developed will form the principal features of a great parkway drive leading from the federal forest reserve north of Pasadena, through the cities of Pasadena and South Pasadena by way of Elysian Park and Wilshire Boulevard to Santa Monica and the sea. This will form a continuous park drive more than thirty miles long, a great boulevard from the mountains to the sea, a parkway drive unique among the park features of America.

D. CON, LANDSCAPE ARCHITECT. AND ERECTED UNDER HIS LASHLAKE PARK CONSERVATORY DESIGNED BY I SUPERVISION

#### SELECTING A GOOD NURSERY TREE.

Usually the grade of a nursery tree is determined by its height, straightness of trunk and caliper at point three inches from the ground. This rule of size, straightness and trunk caliper holds for those varieties which are good growers in the nursery, but there are others, and desirable ones too, like Rhode Island Greening, which are crooked growers and make first-class trees even though they are crooked. A first-class tree should be well grown, be healthy and vigorous, have the peculiar characters of the variety (this allows crooked trunks if they result from the natural habit of the tree), be free from insect and disease blemishes, with smooth, clean bark and stocky trunk, have the union of cion or bud with stock healed over, and be mature (this means that the green leaves should not be stripped off before they are ready to drop naturally).

Low-headed trees cannot, of course, be graded in height with high-headed ones of the same grade, nor can one-year-old ones compare in all respects with two-yearolds of the same grade. A general standard for grading is adopted by most nurserymen and this in a measure answers the purpose if the stock is about the same age and character when sold. Now that low-headed and oneyear-old trees (besides the peach) are demanded, it might be a good plan to adopt certain measurements for lowheaded trees and others for high-headed trees one year old, and other measurements for two years old, etc.

It is often the case that when the proper way of heeling in trees is not understood, the roots are only partly covered and they dry out to the extent that the trees make only a weak start, if any, and die during the first season.

In digging nursery trees the root system is injured and about seven-eighths or more of it is left in the ground. Since the root system is reduced so much the top must be reduced proportionately to maintain a fair balance between top and root. The roots should be pruned so as to leave only three or four inches of each one. All bruised parts should be pruned off and all cuts should be clean and smooth. The tree is then in shape to be quickly and easily planted, for a slight up-and-down movement of the tree, while the earth is being thrown in, will settle the earth around the roots, where it should be firmly packed. If the ground is well prepared the holes for the trees need not be very large, but if it is hard or in sod it is well to make them three or even four feet across.

The tops should be pruned, leaving spurs with two to four buds each, and the "leader" should be cut off about two and one-half feet from the ground. The more foliage the better on the little trees, because leaves increase the circulation and assimilation of the sap and shade the

trunk.—. American Fruits.

#### WOMAN'S NATIONAL AGRICULTURAL AND HORTICULTURAL ASSOCIATION.

The annual convention of the Woman's National Agricultural and Horticultural Association was held under the auspices of the Horticultural Society of New York, at the New York Botanical Gardens, Bronx, New York,

on Friday, May 7.

An interesting program was provided, which held the attention of the audience-which was a large onethroughout the session. The 1915 Conference Committee, which consisted of Mrs. Francis King, Miss Hilda Loines, Mr. Geo. T. Powell, Mr. Bernard N. Baker, Mrs. Albert B. Boardman and Miss Alice E. Robbins, left nothing wanting in the arrangements.

The exhibit of members' work, which was in charge of Mrs. S. A. Brown and Mrs. Florence Merriam Hill,

was a most creditable one.

At the executive meeting, held in the forenoon, the old directors were re-elected to office. The officers, having been elected at the last convention for a two years' term, serve for another year. The various committees rendered some interesting reports, the membership committee showing an increase for the year of from three hundred and sixty-five to over eight hundred members.

A change was made in the by-laws to provide for difterent classes of members as follows: active members, associate members, sustaining members and life members. The dues of the active members remain as heretofore-\$1 for the year. Associate members' dues were fixed at \$2; sustaining members, \$5; life members, \$25.

The program was made up of the following speakers: Dr. S. E. Persons, Cazenovia, N. Y., "The Cazenovia County Fair"; Arthur D. Dean, Albany, N. Y., "Agriculture in the Rural Schools"; D. G. Mellor, New York, N. Y., "Official Marketing of Farm Products"; Frank A. Waugh, Amherst, Mass., "Dwarf Fruit Trees"; William C. Demin, Georgetown, Conn., "The Possibilities of Nutgrowing in the East"; Maurice Fuld, New York, N. Y., "Perennials"; George T. Powell, New York, N. Y., "Some Important Requirements in the Back-to-the-Land Movement"; Samuel Fels, Philadelphia, Pa., "Vacant Lot Gardening"; Miss Louise Klein Miller, Cleveland, Ohio, "The Education and Civic Significance of School Garden Work"; Dr. C. D. Jarvis, Washington, D. C., "Home Gardening Under School Supervision.

Mrs. Charles Frederick Hoffman, who was to address the convention on the "International Garden Club," prevented from being present owing to illness. Mrs. Albert B. Boardman and Thomas W. Whittle, Commissioner of Bronx Parks, New York, were among the

speakers not on the program.

John Cook, of Maryland, who had been invited to address the conference on his experience on rose culture, wrote that owing to his age, being eighty-two years old, it was impossible for him to be present in person, but he contributed an interesting paper, published elsewhere in these columns, which was read by the secretary, Miss Loines.

#### INTERNATIONAL GARDEN CLUB.

The opening of the clubhouse of the International Garden Club, which has taken over the Bartow Mansion, Pelham Bay Park, New York City, occurred on May 1 under most auspicious circumstances, with a notable gathering, which included Governor Whitman of the state of New York, and many others prominent in the official and social world.

The ceremonies attending the opening included the

planting of a Red Oak tree by Governor Whitman, to take the place of the ancient "Treaty Oak" which was destroyed three years ago, and under which tree a contract for the sale of the land was signed by the Indians to Thomas Bell in 1654. After the exercises were over refreshments were served in the new clubhouse, the interior of which has been entirely renovated and newly furnished.

As has already been reported in these columns, the purpose of the club is to make it a headquarters for all garden interests. Its promoters aim to in time establish a horticultural garden, which may compare favorably with the world renowned Kew Gardens in England.

The seventeen acres of ground which surround the mansion will gradually be developed into a general garden, which will include a rose garden, a hardy garden and a rock garden. This department is under the supervision of Arthur Herrington.

The officers of the International Garden Club are: Mrs. Charles Frederick Hoffman, president; Dr.

Nicholas Murray Butler, honorary president; Judge William A. Day, treasurer; Mrs. H. de Berkeley Par-

sons, secretary.

#### STATE FLOWER SHOW AT COLUMBIA, MO.

At the tenth annual spring fair of the College of Agriculture, of the State University, on April 23, 24, 25, at Columbia, Mo., students of the Department of Horticulture held a flower show as a part of the educational exhibit.

The schedule included classes for specimen plants and cut flowers; also for floral designs and table decorations and provided for both the professional and the amateur grower. The show was held in an enormous tent having a floor space of 9,600 square feet, and proved a great success in every way. Aside from the cut-flower exhibits, plants and decorative designs were very artistically arranged, and formal and rock gardens were made by students of the Department of Horticulture of the University of Missouri. The University Department of Entomology made an interesting exhibit of specimens of injurious and beneficial insects.

The judges of the show were: Dr. J. C. Whitten, professor of horticulture of the University of Missouri; Mrs. J. G. Babb, president Civic League, Columbia, Mo., and L. P. Jensen, landscape architect of Busch Estate. St. Louis, Mo.

#### THE AMERICAN DAHLIA SOCIETY.

A new society, under the name of the American Dahlia Society, was organized in New York on May 10. The meeting was called together by Richard Vincent, Jr., of White Marsh, Md. A representative gathering of professional and amateur growers of the dahlia assembled at the Grand Hotel for the purpose of organizing. The main object of the society is to disseminate a greater knowledge among professionals and amateurs on the culture of the dahlia and to arouse a greater interest in dahlia shows. It was voted to hold the first annual show of the society in New York in the Fall.

The following officers were elected: President, Richard Vincent, Jr.; Eastern vice-president, Geo. L. Stillman, Westerly, R. I.; Central vice-president, E. S. Brown, East Moriches, N. Y.; Southern vice-president, L. P. Peacock, Berlin, N. J.; Western vice-president, W. W. Willmore, Colorado; secretary, Jos. J. Lane, New York, N. Y.; treasurer, F. R. Austin, Tuckerton, N. J.; Executive Committee, Geo. W. Kerr, I. S. Hendrickson, James

Duthie, John S. Vincent, Hugo Kind.

#### **QUERIES and ANSWERS**

We believe the greatest good can be accomplished for the greatest number, by instituting a query column; or an exchange of experiences, on practical propositions, by our readers.

You are invited to contribute questions, and answer others.

Each question as received will be given a number, the questioner's name will not be published, but the source of the answer will be given unless otherwise requested.

We all have something we would like to know more about. Here is your opportunity to ascertain somebody's experience in just that matter.

atter. Nothing will tend to better fellowship than helping each other. Take advantage of this "Question Box."

#### REPLYING TO DISCUSSION OF THE QUESTION OF HARDINESS AND VIGOR. ENGLISH vs. DUTCH RHODODENDRONS.

To me, the most interesting contribution to your last number (April, p. 199), was the letter by Hans J. Kohler. Although this was mainly in the form of interrogations, it was evident that Mr. Kochler knows more about rhododendrons than his letter would lead the uninitiated to suspect. I hope, for the sake of this noblest and grandest of all flowering shrubs, that a good discussion will result. I know too little myself to speak authoritatively on the subject, yet add my testimony for what it is worth. First, then, question 1: The rhododendrons grafted on ponticum, from whichever country, are less hardy than those on catawbiense. is no possible reason why the Dutch rhododendrons should be less hardy than English. Both are grown in friable, sandy peat soil, and the winter in Holland, on the whole, is probably more severe on the average, than the winter in southern England, where the majority of the rhododendrons are grown at Basshot. Of course, the Holland stock may be more "succulent," owing to much moisture in the soil causing fast growth.

Question 2 is answered in the foregoing.

Question 3 (or c), and 4 may be answered by saying that for a long time past the chief English raisers and exporters of rhododendrons have been devoting special attention to the production of perfectly hardy, free growing and floriferous hybrid and crossbred varieties. The beautiful Gomer Waterer is the best example. But look over the list of the favorite kinds and see how many bear English names.

Question 5 (e).—Layered rhododendrons, while quite desirable, are too slowly procurable to make them profitable to the commercial grower. A. BEACON, Massachusetts.

Can any of your readers advise me of the value of spent hops from breweries as a fertilizer? What is the best method to use for mixing and applying them to the soil? PELHAM. New York.

In answer to your inquiry as to the value of spent hops as a manure will say, that we have used it for the past two years as a mulch for shrubbery borders and for top dressing of lawns. We prepare it as follows: The spent hops are deposited in long piles, and permitted to lay till early winter when the piles are turned over and mixed with two thirds of well decomposed stable manure. This is again turned over the following winter, and in the month of February loaded on cars shipped to our various country places and applied as you would manure to the lawns and mass plantations.

In early spring the surplus material is raked off the lawns and used as a mulch wherever needed.

This season we are using a few carloads of this mixture on land which will be planted with corn.

As to its value for this purpose, the following abstract from a letter of March 10, 1914, written me by Professor J. C. Whitten, of the University of Missouri, may be of interest:

"With regard to the fertilizing value of spent hops or their value as a mulch for plants. I might say that the spent hops contain a relatively small amount of plant food material or of fertilizing value. On clay soils which do not contain much humus or vegetable matter, they are a good top dressing, however, to furnish a mulch. They are a very good top dressing for lawns, especially in heavy clay loam where something in the way of decaying vegetation is needed. For this purpose they would have approximately one-half the value of stable manure. They are also a very good mulch for young newly planted shade trees, shrubs or shrubbery masses on the lawn. They have quite as good qualities of mellowing, loosening and floculating the soil as stable manure has, but since they contain much less plant food, they probably would have about half the value of manure as a mulch,

"For mulching trees even fresh hops are suitable for top dress-While they rot somewhat slowly in the air, if they are worked slightly into the surface of the soil as tillage is made

around trees, shrubs, etc., they will make a good mulch even from the beginning. For lawn purposes they ought to be composted until they are fairly well rotted. You can decompose them most quickly if you mix them about equal parts with manure. They will not only rot much more quickly in the manure, but they will also absorb a great deal of the soluble plant foods that otherwise would leach out of the manure and be lost. will also tend to catch and hold some of the nitrates in the manure which will otherwise break up and be lost into the air. So the mixing of equal parts hops and manure will not only decompose your hops and get them into good condition, but will also economize the manure used by absorbing most of what would otherwise be

L. P. JENSEN, St. Louis, Mo.

In answer to "Pelham, New York," p. 199, April issue, I think he may use spent hops from breweries with every prospect of success. Especially for mulching newly planted hardy plants in beds and borders, or ornamental shrubs, the spent hops will be serviceable. They conserve the moisture in the soil and keep the roots cool during a hot spell. It may interest him and others to know that a firm in London, England, derives a considerable income from the sale of "Hop Manure," which is simply spent hops that have been "treated" with certain chemical fertilizers. A good fertilizer should contain nitrogen, phosphoric acid and potash, but the mixing of these calls for knowledge and care. The spent hops can be gradually worked into the top-soil and so furnish organic material. They are excellent for rose beds, but if used liberally it is best to rake off as much as possible late in the season, as they tend, after a year or two, to lighten the soil too much. Though these hops smell so sour, they do not seem to transmit their sourness to the soil. But if the soil should become sick or out of sorts, dress the surface with slaked lime at the rate of 4 ozs. DAVID DUNLOP, New York. per sq. yd.

Having had my peach crop ruined the last two seasons by late spring frosts, I have decided to experiment by burying 25 pounds of ice about the roots of my trees, in the expectation that this will retard budding until the danger of frost is over. If any of your readers have ever attempted a similar experiment I would appreciate hearing of their results, or of any other method that might hold the trees from budding until after all danger of frost is past.

Oklahoma.

Surely that is a very novel experiment that "A. C. S., Oklap. 199, April number, suggests for checking the growth of his peach trees, which, he says, have been injured the past two years by late spring frosts. Let him try it with a few and tell us how it acts. But I would prophesy that he will find it as troublesome and laborious as using smudge fires, which is one of the preventives of spring frosts, and of which he has doubtless heard. If not, the Gardeners' Chronicle will enlighten him before another spring arrives. Perhaps "A. C. S." has exceptionally early varieties, and his plantation may be on low lying record. Event of the troop ally are in the situations. The cold ground. Frost gets trees always in such situations. The cold water cure might be tried if the trees are caught by frost, i. e., early in the morning after a frost, spray the trees with cold water before the sun strikes upon them. This helps to thaw out the frost, for it is the sun, striking on the frozen buds, that does the damage really, as the sudden expansion of the tissues ruptures them. Fighting the frost, however, is not an easy job. He should remember, moreover, that even if the roots are held in check, growth can start in the branches. W. RICHARDS, Ohio.

### Of Interest to Estate Owners

The National Association of Gardeners maintains a Service Bureau which is at the disposal of all who may require the services of efficient gardeners in their various capacities.

The association seeks the co-operation of estate owners in its efforts to secure opportunities for those engaged in the profession of gardening who are seeking to advance themselves. It makes no charge for services rendered. It endeavors to sup-ply men qualified to assume the responsibilities the position may call for.

#### NASSAU COUNTY HORTICULTURAL SOCIETY.

The regular monthly meeting of the Nassau County Horticultural Society was held at Pembroke Hall, Glen Cove, Wednesday, April 14, President Westlake presiding.

The Euchre, held under the auspices of this Society, on April 8, was reported to have passed off successfully in every way, great credit being due the committee in charge for their work and the very able manner in which they conducted the proceedings.

It was agreed to hold three shows during the coming season, summer show to be held in the week of June 6; Dahlia show October 7: Fall show October 28 and 29. Offers of special prizes for the fall show were received from the following: Hitchings & Co., W. E. Marshall & Co.; Stump & Walter Co.; Vaughan's Seed Store; Pino Lyplot Co.; John Wilk. Weber & Don; Burnett Bros.; Bon Arbor Co.; Harry A. Bunyard Co.; J. M. Thorburn & Co.; Peter Henderson & Co.; C. H. Lotty; Julius Rochas Co.; Lord & Burnham; Pierson U Bar Co.; Cottage Gardens Co.; Casters Tested Seeds, Inc., also from F. Edwards, W. R. Kinnear, Rev. J. W. Gammack, E. M. Underhill and Kopler Bros., Glen Cove.

Frank Honeyman was awarded 1st prize for the best vase of Roses (mixed). hibits for next meeting will be 3 heads of lettuce, 3 heads of cauliflower and 1 vase of outdoor flowers

> JAMES GLADSTONE. Corresponding Secretary.

#### NEW LONDON HORTICULTURAL SOCIETY.

New London Horticultural Society held its regular monthly meeting in the Council (hamber of the Municipal Building, State street, Thursday, April 8. After the usual business routine Professor E. H. Jenkins gave a very helpful and instructive address upon "Fertilizers in the Orchard," outlining the way to best use the chemicals and farmvard manure upon apple and peach trees, making special mention of the sowing of cover crops for turning under to enrich the soil. Also making study of certain chemical manures on certain trees and to follow up results of same as to which was most beneficial for good results on the different applications to those trees. A good discussion followed among the members. Mr. Jenkins was given a rising vote of thanks for his able paper. The attendance was small, owing chiefly to another important meeting at Norwich, to which several

# Shorburn's Seeds

VERY large number of our customers grow flowers and vegetables for profit. Such customers cannot afford to run risks when purchasing seeds and bulbs, for the value of the crop makes the cost of seed of little importance by comparison.

We have a small book about ourselves and our record in the seed business, which extends back more than a hundred years: to the "Days of Washington and Jefferson."

We should like to send you a copy of this and a copy also of our 1915 Catalogue if you have not yet received vours.

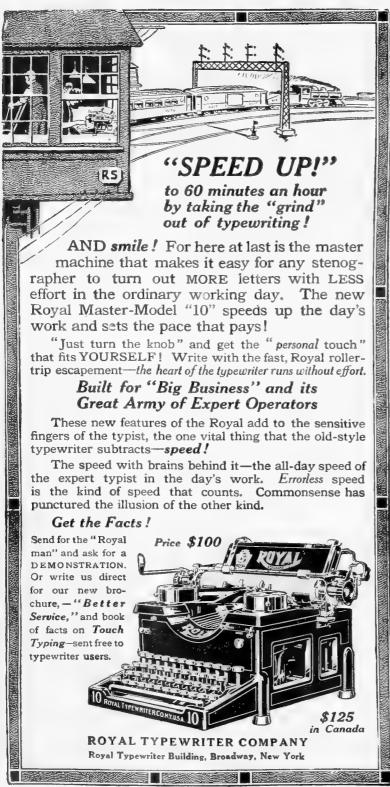

It will soon be tune to talk about bulbs. If you are not on our mailing list send us your name and address that you may receive our Bulb Catalogue when issued. It will be of unusual interest this year.

Since 1802 53 Barclay St., through to 54 Park Place NEW YORK

of the members had gone. A beautiful display of Schyanthus in pots was exhibited by John Maloney and Stancy Jordan. Three new members were voted into the Society. Messrs, Jordan, Robinson and Maloney gave brief reports of their visit to the New York Flower Show. The next meeting of the Society will be neld May 13, and it is hoped "Mr. Mason of Farmington, Conn.," will give a paper on Perennials. STANLEY JORDAN.

### THE WESTCHESTER AND FAIRFIELD HORTICULTURAL SOCIETY.

attendance of members at the monthly meeting of this Society was very large and represented a goodly percentage of the entire membership. President W. J. Sealey was in the chair. Six new members were elected, and as many more new names were proposed for membership in the Society. A magnificent display of flowers and plants were staged on account of the prize offered by Mr. A. L. Ricards for the best exhibit at this meeting. The prize was won by Mr. Robert Williamson, with a grand specimen orchid plant, Coelgyne Cristata. The thanks of the Society were accorded the other exhibitors, as well as the judges. Awards as follows: (elsia Cretica, from John Andrew, vote of thanks; Adiantum Williamsi, from James Foster, honorable mention. This was a very fine specimen of this variety. Specimen plant. Pelargonium, from Robt. Williamson, vote of thanks; pair et spermen plants of Rhododendrons, "Pink Pearl," from P. W. Popp, honorable mention; vase of Antirrhinum in variety, from Alex. Geddes, honorable mention; collection of Stocks from Peter Cruse, honorable mention; display of Carnations, "Benna," "Sunburst," roses from Robt. Grunnert, vote of thanks; display of Tulips in variety, from Emil Leonne, vote of thanks; specimen Azalea, from Louis Wittman, vote of thanks; a beautiful specimen Orchid plant in 5-inch pot of Dendrobium Thrysiflorum, from the Geo. E. Baldwin Co., received an honorable mention. The display was a credit to the members. The exhibition committee of the summer show also fall show, were appointed, as well as the managers of each exhibition. The summer exhibition will be held in June, at Greenwich, Conn. The following have been appointed to serve: Robt. Williamson, Robt. Grunnert. Wm. Whittin, John Andrew, P. H. Flaherty, Alfred Nicolls, all of Greenwich, Conn.; Manager, William Smith, Portchester, N. Y. Fall show, to be held in November, at Stamford. Conn., the following have been appointed: James Foster, Anton S. Peterson, John T. Burns, Abraham Wynne. Alex-Geddes, Owen A. Hunwick, all of Stamford, Conn.: Manager, Henry Wild, of Riverside, Conn. This Society is at all times endeavoring to add attractive features to interest the public, for whose benefit these exhibitions are arranged. P. W. POPP, Sec'y..

### CONNECTICUT HORTICULTURAL. SOCIETY.

The regular bi-monthly meeting of the Connecticut Horticultural Society was held in the County Building, Hartford, at 8 o'clock, President Warren S. Mason officiating as chairman. Plans were made for the Spring Flower Show, to be held Tuesday. June 10, the proceeds to be divided with the Union for Home Work, a charitable society. This spring show will be held in Unity Hall, on Pratt street.

There was an exceedingly fine exhibit of pansics staged by John C. Willard, of

THE GARDENERS' CHRONICLE

IS A JOURNAL OF USEFUL TECHNICAL KNOWLEDGE FOR THE ADVANCED AMATEUR. SUBSCRIPTION, \$1.50 A YEAR.

Wethersfield, John F. Huss, superintends ent of the James J. Goodwin Estate, exhibited a rare speciman plant, Australian Glory Pea (Clianthus Dempieri). The plant attained a height of about three feet and had six deep red blooms with black centers. Mr. Huss dilated on the cultivation of this plant, explaining the necessity of using extreme care in every detail of its growth to the arrival at maturity, and that it was his ambition to raise about six such specimens and then he would be content to tackle another such delicate operation. President Warren S. Mason, superintendent of the Pope Estate, Farmington, staged a fine collection of spring flowers: Narcissus, Golden Spur, Victoria and Von Sion, Hardy salvia Gregii, Grape Hyacinth, Italian Hyacinth, and Dutch Hyacinths, "May," flesh color: "Gertrude," a rose pink, and "King of Blue," a deep purple. In this collection white Tulips, Banksia rose, and Spuills. The combined exhibits made an excellent showing. President Mason named Alexander Cumming, Junior, Ed. A. Brassill and A. Righenzi judges, and they awarded the pansies a certificate of merit; the spring flowers a first-class certificate, and the Australian Glory Pea a first-class certificate, which was duly ratified by vote of the members. The judges also received a hearty vote of thanks. One new member was elected.

The next meeting will be held May 14, and will be Darwin Tulip night.

ALFRED DIXON. Secretary.

#### THE HORTICULTURAL SOCIETY OF NEW YORK.

An exhibition of plants and flowers was held on Saturday and Sunday, May 8 and 9, in the Museum building, New York Botanical Garden, Bronx Park. The following is a list of the prize winners.

ones your Rhododenators toom the Cadstern for years flowers. It is that the roots for hood small from Alphano are easier the parpose

# Vital Helps for Your Lawn Your Garden, Shrubs and Trees Secured by Using Alphano

OU must not think that, just because you had some fertilizer spread on your garden and spaded in, you can let it go without giving the plants further food; and expect anything like top notch results.

In the first place but a very small portion of the foods in the fertilizer actually reaches the roots, because it is next to impossible to mix fertilizer lumps and chunks up thoroughly enough with the soil. Besides after a few rains, most of the food value has been carried down in the soil below the roots and for all the good done, it might iust as well not be there.

Alphano, if sowed in the drill with the seeds, is right there where the roots are. Being finely granulated, it becomes a direct part of the soil and is readily available to

the roots. Or as a boost to the plants, it can be dug around the plants once or twice during the season. The results will be a gratifying surprise to you.

Then there are your shrubs, Rhododendrons and

voung trees; see that some is dug around them, and just witness the gladsome response.

On your lawn, more than likely you put the usual fertilizer and then had the best part of it raked off because of its unsightliness and choking of the grass. This being so, only the top roots were temporarily stimulated and when hot, dry weather comes, the grass will thin out and brown up.

What it needs right now is a good top dressing of Alphano, well raked in.

It will furnish food for the roots all summer long.

It will fortify your lawn and your garden against dry weather, because it absorbs five times its weight in moisture, acting like a huge sponge. It is odorless, so you can

use it without any objec-

tion, anytime, anywhere. It's low cost and long enduring benefits make it practical to use freely. Order some. Give it a fair trial. For further facts, send for the Alphano Book.

# The fatal V-Shaped Crotch!

# Only real tree surgery can save a tree of this type from eventual destruction.

On nearly every place there are some trees of this weak crotched type. There is only one safe thing to do-have then examined and attended to at once. Every wind splits a weal crotch a little further. Decay eats its way from this split down through the trunk. It becomes weaker and weaker and thencrash!—the tree is ruined. See picture at left which is typical o millions of trees.

To neglect such trees is fatal. To put them in inexperi enced hands is equally so. They can be saved by real tree sur gery. As shown by the following letter-

#### Real Tree Surgery is Davey Tree Surgery

Davey Tree Expert Co., Kent, O. Gentlemen:

I want to tell you how pleased we are with the work done by your representa-

tive on the trees on this estate two years ago.
Unfortunately, these trees had been worked on four or five years ago by some New York concern. After their work had stood two or three years, it proved to be absolutely worthless. The decay had continued to eat its way behind the fillings and many of the fillings were broken and in bad condition, proving their work both unscientific and mechanically wrong.

Just about two years ago, we engaged your concern to do the work all over again. We were highly pleased with the work at the time because of its apparent perfection, both scientifically and mechanically. But, now, after a lapse of two years, I can say to you that this work done by your men is absolutely perfect. It is, in my opinion, a model of tree surgery. I cannot recommend it too highly nor express too strongly our appreciation of the great service rendered in this connection by your admirable corps of men.

# **BOBBINK & ATKINS**

WORLD'S CHOICEST NURSERY and GREENHOUSE PRODUCTS

GROWN IN AMERICA

Among the many attractions growing in our 300 acres of highly cultivated Nursery are large quantities of the following specialties:

#### PAEONIAS

The Peony, in its early stages was respected with awe, and its beauty associated with the gods Today, after ages of persistent effort, this wonderful flower is accorded its rightful place as King of Flowers. The beauteous torms, exquisite tints and shades, and the delicate fragrance of the newer varieties dely pictures or words. As producers we can often with pride a notable collection, and shall be pleased to give A COMPLETE LIST ON INQUIRY.

#### **IRISES**

While the Peony is magnificent with its majectic glors, the clusive and harmonious colors, blending in one flower, make the Iris a special favorite. In no other flower is there such wonderful color, harmony, and in form and texture the Iris out-rivals the orichid. The various sections will grow either in water or in very dry soil.

#### POT-GROWN STRAWBERRIES

Every garden no matter how small should have a strawberry bed. It is the earliest fruit, and being very prolific, fresh fruit, with the full flavor, can be gathered continually. Our collection represents the result of many years' trial.

The above are described and priced in our **Illustrated General Catalog No. 45**, mailed upon request. When requesting catalog please state in what you are interested VISITORS are made welcome to inspect our which is very important before placing orders.

# Homewood, the Country Estate of R. B. Ward

"Homew od" is located in the hills of Westchester County at Wykagl, an outlying district of New Rochelle, N. Y. Presenting, as it does in the accompanying illustrations, all the appearances of a completed country estate it may be said to be still in the state of development,

Huguenot settlers. The dwelling house stood on what is now the farm portion of the estate, a long, low house, siding off shingles rounding at the bottom, all dressed by hand. Mr. Schureman was a prosperous farmer and the owner of some excellent cattle, consisting of horses, cows

> and swine and a great variety of poultry, all of which attracted the marauders soon after the war began.

> Just prior to the Battle of White Plains, a detachment of Lord Howe's soldiers were quartered at Xew Rochelle, and with the lawlessness common to invaders, they con-

THE COUNTRY HOME OF R B WARD, WYKAGYI, X Y, SHOWING THE REAR , JEW OF THE MANSJON

for its owner, R. B. Ward, an enthusiastic horticulturist proposes to make "Homewood" the most ideal country estate that is to be found anywhere in the eastern states. It is already a most charming place, but when the contemplated plans are carried out for further improvement it will become a beauty spot.

The history of this property dates back to the Revolutionary days, for it is recorded to have been owned by one Jeremiah Schureman, whose wife was Magdalina De Veaux, of New Rochelle, a descendant of the French

sidered the farmers fair game for pillage. Mr. Schureman had already lost a considerable amount of horses and cattle, and one dark night overheard an attempt at driving off his stock. He opened the upper part of the old half door and called out, "I know who you are and will report you in the morning," With this, one of the men leveled his musket and shot Mr. Schureman, who fell over dead in his own doorway.

The home of Mr. Ward, a large mansion of pleasing architecture, built by him a few years ago, is situated

THE TERRACE COMMANOS A SWEEPING VIEW OF THE LAWNS, GARDENS AND FARM

3 THE OLD CASHIONED SUNKEN GARDEN. THE EXTERIOR OF THE BREAKFAST ROOM IS SELN IN THE GACKGROUND attention to this fruit garden and aims to make it the most perfect of its kind in the country

Adjoining the fruit garden an extensive herbaceous garden has been planted and both of these gardens are separated by the pergola from a stretch of velvety lawn which reaches out to the mansion. The entire grounds are well planted in rhododendrons, azaleas and evergreen shrubbery of a great variety. Many plants and shrubs of a deciduous nature are to be found about the grounds.

In the sunken garden are to be found

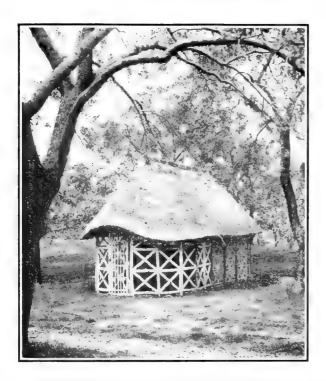

2—THE BREAKFAST ROOM, OVERLOOKING THE SUNKEN GARDEN, WHERE CUT FLOWERS AND POTTED PLANTS ARE LIBERALLY USED FOR DECORATIONS

4--1HE CONSERVATORY, WHICH IS ATTACHED TO THE MANSION, IS ALWAYS RESPLENDENT IN RARE FOLIAGE PLANTS.

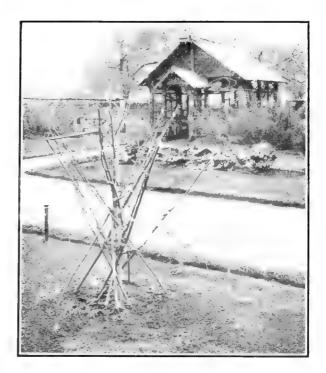

close to the main entrance of the property. The approach to it is effectively planted so that while the home is in full view of the road passing the property the landscaping provides the desired privacy to it.

What may be regarded as the principal feature of "Homewood" at the present time is the new French fruit garden with its Pyramids, Cordons and Espalliers—dwarf fruit trees. The garden was completed this spring by Nicholas Butterbach, who is superintendent of the estate and who has had much experience in dwarf fruit culture, being a student of the French originator of the dwarf trees. Mr. Butterbach has been devoting much personal

THE HEATCHED ROOF TURKLY HOUSE IS ONL OF MANY UNIQUE FEATURES OF THE WARD ESTATE.

THE RUSHIC SUMMER HOUSE, WITH A PARAMED ERROLD FROM
IN THE FOREGROUND, AT THE LOCAL OF THE
FRENCH FRUIT GARDEN.

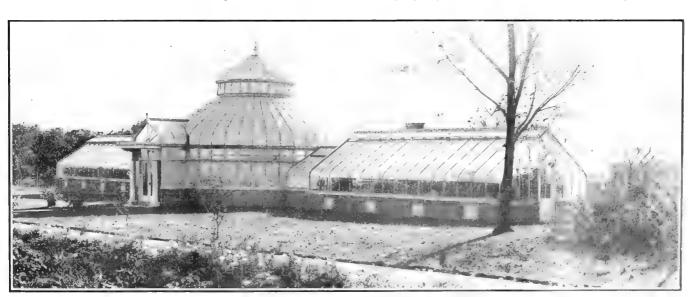

many varieties of old-fashioned flowers. A rose garden covering a considerable area and containing all the finest varieties of outdoor roses is now in process of development.

A lowland sloping off some distance from the side of the mansion is to be converted into an artificial lake this summer, which is to become part of an extensive aquatic garden scheme. The lake is to be well stocked with ornamental fowl. A bridle path will encircle the lake, then lead off through the woods skirting a portion of the estate, and wend its way through the fruit orchard and around the gardens to the other side of the property.

A compact greenhouse range is another parcel of "Homewood." Here roses, carnations, chrysanthemums, sweet peas and many other flowering and foliage plants are found in their season grown to perfection. In the

very near future the range will be extended to include an orchid house, grapery, melon house and houses for vegetable growing.

Part of the estate still remains as a farm equipped with its modern barns, dairy, smoke house, poultry runs, etc. The rustic construction, shown in the illustrations, of the summer house and the turkey house are the handiwork of Mr. Butterbach, and rustic effects are to be put to use wherever they can be fittingly employed in building up the wooded portion of the estate. Mr. Butterbach, who is a gardener of the old school of gardening, but progressive and aggressive in his methods, says "tip-top" in his slogan for everything about "Homewood" and that with Nature's co-operation and man's skill he expects to transform in a few seasons what remains undeveloped of the property into a veritable horticultural paradise.

THE GREENHOUSE RANGE ON THE R. B. WARD ESTATE, WHICH WILL SHORTLY BE CONSIDERABLY ENLARGED.

# A Landscape Style for the United States?

By a Landscape Architect.

In the wooded hill slopes, the blue skies and the distant sea and valley vistas, the Renaissance garden artist of Italy found the material and the inspiration for the Italian garden wonders. His efforts were directed toward the creating of an environment that filled the necessity of his time; his was a garden not to be looked at alone, but to live in—an outdoor continuation of the residence. And thus he created a boldly formal style of gardening.

His work was followed in other countries. French and English garden designers felt the beauty and charm of the Italian work, and tried to copy it for their country; but realizing that there was missing in their work the element that Italy possessed—the setting of sky, mountainside and brilliant sunshine—they elaborated their work with flower beds and other decorations.

Then came the artists of the English style. They took into consideration the moist and cloudy atmosphere of their home country, its stretches of level plain and its gently rolling fields, and they created the garden style typical of its name, "English." Irregularly outlined lakes and pools replaced the geometrical water gardens, while large fields of velvety grass, bordered by groups of graceful shrubs and trees, brought back the harmony with nature which imported art had destroyed. And in using the word "nature" I do not mean to confine its relation by picturing some certain small valley scene and to say that the English style was based on that alone, but upon nature in its broader phases; cloudy skies and dreary days, which made one appreciate the more the contrast of sunny lawns; nature without the laughing mountain brooks, but with slowly winding, stately rivers; characterized by moisture loving deciduous trees rather than evergreens with the dry air in which they are found. And last, but not least, nature reflected in the character of man; on the one hand slow and phlegmatic, on the other fiery and passionate.

In time the English style, in its turn, found its way to the continent, to France and Germany, and even into the heart of Italy itself. Here fine formality was destroyed for large spaces of drouth burned grass; exotic trees crowded out the native trees, and we cannot blame the Italian artist that he sees in the change only the destruction of the old with no compensation in the building of the new. The English style, beautiful and fitting in its own home, had come to a foreign country and failed in its mission. Some authors, in their love of the old Italian style, call the English style "sentimental," and sentimental and tame it certainly must have looked under the bright blue Italian skies.

The English style also came to the United States, and some of its greatest followers were American landscape architects. They have designed great works in park and garden art. But they worked in the English style, with large areas of shorn bluegrass, which, although in their home surroundings were full of endless perspectives, partly lost, in the bright atmosphere of the American continent, their depth of vista, and in midsummer the perspiring visitor to the scene, unconscious of style or vista, curses the sunniness of these plains.

And yet without doubt our great men have felt the lacking harmony and have sought to improve it; probably also they have found localities where the English style could be used fittingly, and in other places have at least pointed the way to better things. But many of their followers, instead of going ahead in the way indicated, have simply come to greater and greater artificiality.

Perhaps where the original style might have been appropriate in some New England state, the same ideas put into effect in the more Western states have produced an effect than which the Italian style of old days, as used in England, could not have been more exotic, more artificial. It is abnormal almost to the point of being ridiculous. Here we plant Kentucky bluegrass seed by the ton; irrigate it at an annual cost that I would not dare to estimate, and on this, plant groups of trees and shrubs of which we have forgotten the native habits if we ever knew them. We plant Chinese, Japanese, Dutch, French, English plants, anything that manages to pull through, without knowing the conditions under which they grow in their native state. Some of these plants are so foreign to us that we do not even know their native country. They are planted because the nurseries grow them, not because we want them for any special character of planting. We plant dry ground plants in bottoms, low ground plants on hills, and wonder why they do not thrive, and in our ignorance probably do not even notice how badly they fit in our landscape scene.

And we have educated the taste of the public to our wrong standard. No beauty of landscape is acknowledged any more unless it has a shorn lawn as foundation We may have native grass, of intense, subtle beauty; as long as it is not clean cut and green as bluegrass is green, we cannot use it. The public does not want it. Of course not; we have educated the public to our exotic standard. We blame the public, but it is we who are to blame.

A style of landscape architecture "for the United States" is something that never can be. No more than an English landscape would fit in Italy, would a New York bit of scenery fit in California. Each section of the country will have to work out its own landscape problems; for some the English effect may be quite appropriate, though our clear sky, warm summers and cold winters due to a continental climate, make it exotic in most places here. For some of our states the solution seems to lie more in the Italian idea of contrast than in the English idea of complete harmony with natural scenery. A close study of nature's characteristics, of the vegetation, soil, climate and other governing conditions, should be the basis of treatment of the landscape question, wherever considered. As a matter of fact, our best landscape architects have already been hammering away on the subject of native planting. The true landscape setting for any country will include and emphasize its own vegetation, not an imported one. Countries with a distinctly deciduous tree character should go slow in evergreen planting, and should use it for variety only: on the other hand a section with conspicuous tree growth and much shrubbery should use that as the basis for planting.

#### MAKING A TREE COMFORTABLE.

In planting a tree to make it grow and there should be no other aim—the tree should be made just as confortable in its new environment as possible. If the land is wet it should be drained, for trees will never thrive with wet feet. The best results are obtained by preparing the land the previous year for the setting of the trees. Clover or cowpeas plowed under in the fall will make humus the following year and keep the soil about the roots. Trees will often do well in poor soils and unfavorable conditions if good soil is placed about their roots, so that they get a good start the first year or so. After they once become established they can do considerable towards taking care of themselves.—Exchange.

# Park System of Portland, Oregon, The Rose City

By Emil T. Mische, Oregon.\*

Portland has an estimated population of 270,000, a two thirds valuation of \$300,000,000, a maintenance bud-

get for parks of \$175,000.

The city's principal industries are lumbering and shipping—principally grain and flour; it is the shipping center of a territory approximately 250,000 square miles in extent. The standing timber in the State represents substantially one sixth of that in the United States.

Since July 1, 1913, the city has been under commission form of government, administered by a mayor and four commissioners. The parks are managed by the Commissioner of Public Affairs, whose other duties are the administering of the public auditorium, sealer of

weights and measures, and the city attorney.

Portland's park acreage is approximately 650 acres within the city limits (comprising an area of about 60 square miles); a bond issue of one million dollars has been expended upon land and construction in addition to the current tax revenue funds. The park extension virtually started in 1908.

The largest park is Mt. Tabor, a large hill 175 acres

mands some fine views of the city plane, the Cascade range of mountains and the snow peaks of Mt. Ranier, St. Helens, Adams, Hood and Jefferson.

Each of the other properties except parkways are 30 acres or less.

Twenty-six playgrounds are provided.

Three miles of parkway extending southwesterly from the center of the city climb the steep hills and overlook the Willamette and Columbia rivers, the flat "east side" and afford a pleasing variety of distant prospects.

Northwest of the city a ten-mile parkway is under construction and along the Columbia a drive extends to a point 30 miles distant from the city and opens a region of scenery remarkably bold, picturesque and inviting. En route are a series of high water falls, cascades, gorges and topographically beautiful scenes. Where the Columbia river cleaves the Cascade mountains it left the shores and borders in this rugged and sublime moulding of the surface.

It is proposed later to acquire a vast forest reservation of some 70,000 acres in extent and by the addition of

ROSE GARDEN IN PENINSULA PARK, PORTLAND

ABOUT FOUR ACRES ARE PLANTED IN ROSES

in extent, mostly fir clad and offering splendid views in all directions. Two miles of 32-foot drives are graded. Its principal vegetative character is that arising from a natural woodland. All planting in it is of native material. When completed an elaborate architectural feature in the form of cascades, staircases, pools and fountains are proposed—taking advantage of the overflow from one city water system reservoir to another.

Macleay Park is 130 acres on the western hills; a deep gorge and a considerable sized rivulet are conspicuous parts of it. Both slopes are covered with a hanging wood in its primeval condition. A short piece of drive traverses it longitudinally and a number of trails wind along the slopes and follow the brook.

Washington Park is 103 acres in area, the oldest developed property. It contains the Zoo, a considerable collection of oriental plants, several statues, and com-

about fifteen miles of drive permit of access by automobile to within a mile and one-half of Mt. Hood's glaciers.

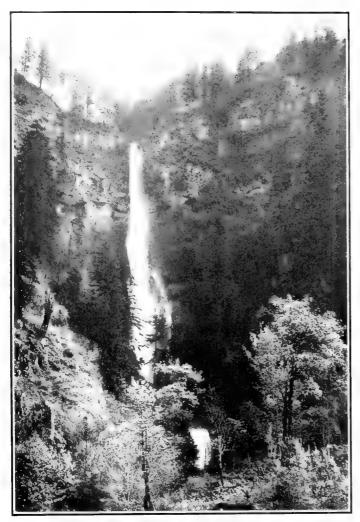

Ascent from about two hundred feet to six thousand above sea level will be possible in a three-hour ride from the heart of the city.

Work on this property has only been undertaken in a trifle more than the past year. When boat landings, picnic grounds, summer camps, trout fishing, mountaineering and snow shoeing are possible throughout the year it is expected our park possessions will be unusually attractive.

In playgrounds the particular phases to be observed are the extent of their equipment—all with the latest type of Spalding apparatus—both in and out of doors: the fence enclosures and provisions of shade and ornamental settings.

But one community center is fully developed by a re-

Landscape Architect, Portland, Oregon.

MULTUOM MI TALLS, IN COLUMBIA GORGE, NEAR FORTEAND creation assembly building, lockers and two gymnasia. A concrete swimming pool is embraced in this outfit.

All equipment is free, including lockers, suits, towels and instruction. Two swimming pools containing about 250 and 280 thousand gallons supply the present offerings.

Climatic conditions coupled with our native flora offer possibilities of park treatment not easily duplicated and only comparably executed on the Pacific Coast.

Bearing in mind that Portland is about three degrees further north than New York City—further north indeed than Portland, Maine, yet supporting vegetation likely to be found in North Carolina, some appreciation of our park vegetation is conceived.

Two characteristics of Portland parks will be distinctly noticeable to visitors from any of the northern tier of states in the East; one that it is the southernmost large city where irrigation is not necessary without all the country side becoming a dreary brown as a consequence of dried herbaceous vegetation and an absence of trees, and the other is the wealth of vegetation cultivated and the distinctiveness of the respective parks in general design, topography and vegetation and architectural supplement.

In traveling westward the eastern delegation will observe the prairies and their covering of bunch grass and sage brush, the eagles in the air, coyotes and prairie dogs on the ground. When the Cascade mountains are approached, say about Spokane, tree growth will be abundant but the aridness is also conspicuous. Pines predominate here whereas further west it is fir. Undergrowth is very sparse and the tree growth is not as dense as further west. After passing the main ridge of the Cascades one emerges at Seattle, Tacoma or Portland, and a greater humidity is evident in the greater density of trees and continuous and thick undergrowth, especially of Salal (Gaultheria Shallow), ferns (Aspidium munitum), Oregon grape (Mahonia nervosa and Mahonia aquifolia) and similar plants.

Rainfall at Portland is substantially the same as at New York City; one hundred miles west on the coast it is twice as great. Moreover the distribution is different here than east of the Cascades, it being more abundant in

A SCINE IN WASHINGTON PARK FARLY IN THE MONTH OF MARCH, SHOWING A LAPANESE PLUM TRUE IN BLOSSOM, AND EDGINGS OF WHITE CROCUS AROUND THE FOUNTAIN.

ONL OF HUNDREDS OF ROSE HEDGES SEEN IN THE RESEMENTIAL STREETS OF PORTLAND

the winter and almost lacking in the summer. This pecularity gives rise to the prevalent reputation of the northwest coast being extremely wet. During the summer the weather is sunshiny without extremes of heat, and each night is cool enough to require blankets for comfortable sleeping.

Customary winters bring only a few degrees of frost, one reason why roses can be picked at Thanksgiving and sometimes at Christmas.

Hardiness here is not a question of extreme colds and drying winds, but a lack of growth stoppage, a consequent soft tissue which suffers even with a degree or two of frost.

Sufficient has been explained to make it clear why roses thrive so well as to cause this city to be known as the "Rose City," why Camellias, Rosemary, Oleander and like evergreens are used in park plantations.

In driving around the city, Eastern visitors are impressed with the free use of English Ivy, English Hooies, Laurustinus, Japanese Hydrangeas, various yews and Australian Monkey puzzles (Araucaria imbri caria). Other interesting plants are to be seen in the yards such as Choisyas, Portugal laurels, Aucubas, privet (L. Japonicum), Photinia (Serrulata), Fuchsias (Riccartonii, principally) Daphnes, Chinese evergreen barberries,

English laurels, bay trees. Chimquapius and a host of others.

Were one word to express the distinguishing features of the Portland parks it would be "quality." Extensiveness and free expansion is not a trait of past park history, but solid construction is the prevailing type and strong character. The latter it would be well for visitors to note particularly, as for instance Washington park has an ornamental vegetative aspect with rustic style of building construction; Mt. Tabor is restricted to native vegetation and is to have colonial architecture; Laurelhurst supports the evergreen vegetation, primarily rural landscape motif, and rough cast stucco; Pennisula, brick and concrete in construction, formal design, gardensque features; Columbia, half timber style in building construction, simple, broad landscape style, curvilinear walk system, evergreen vegetation.

Parkway development has not yet advanced sufficiently to prominently assert its local character of differentiation, and it would be hardly worth while to describe it except to the student. In due course the parkways will be more strongly individualistic and distinctive in character than the parks, also they will give better opportunity as exemplified in possibilities in plant culture than any other public property.

ROSE BUSILES ON THE GROUNDS OF A PRIVATE BUSILEXCE IN THE CITY OF POPTLAND

# Some Notable New Jersey Gardens

By The Onlooker.

Perhaps at no time this year will the country look finer than it did on Sunday, May 9, which was Mothers' Day in the social calendar. The open, sunny weather of April gave vegetation an excellent start and the proverbial showers of that month were not wanting, so that at the beginning of May all nature was arrayed in her freshest and greenest mantle.

It was then time to move about and see the gardens -see their Daffodils and Tulips and beds and greensward; see their shrubberies bearing clouds of pink and white from Dogwood and Crab-apple, view the spring flower gardening and take an early look over the first crops in the kitchen garden. One might have gone to that land or region of fine gardens, the Berkshires, around Stockbridge and Lenox, or the north shore of Massachusetts; or to the north shore gardens of Long Island, or to Westchester county or any one of a dozen famous gardening districts. One may be sure it would have been the same in any or all cases, for the humblest garden looks charming at the end of April and in the first weeks of the month of nests, the merry month, the children's month of outdoor parties and processions.

It was my good fortune to see notable estates at Madison, N. J., owned by enlightened patrons of gardening, and supervised by men highly skilled in their profession. Madison is in the center of a delightful, semi-rural district, 27 miles west of New York.

Mrs. Willis James' extensive place, which was first visited, contains many acres of beautiful lawns, trimly kept, with sheltering belts of shrubbery and tall trees, the choicer trees and shrubs being well placed for general effect over the lawns, and most of them having been planted by William Duckham during the twentyone years in which he has had control. Those planted back twenty years ago are 30 feet or more high in many cases, and if our friend lives for another twenty years, as we hope he will and much longer, by that time he will be able to point with satisfaction and pride to the noble result of his labors of the long ago. This fact is one that owners of new or undeveloped property would do well to remember—they need not and ought not expect finished results the first year, nor the first ten years, but after twenty, twenty-five or thirty years there will be a growing feeling of satisfaction that here is something that is the direct outcome of my labor, something I projected, and such owner will have the pleasurable feeling of having really made the world a better place to live in than he found it, and have materially assisted in developing his own particular corner.

Planting trees is a very excellent form of recreation or employment. Who of us have not known several men who, at the end of a long life, have pointed to tall Elm trees, perhaps Oak trees, or Lindens or Horse Chestnuts, or Evergreens, and said: "I planted that when I came to this place." The writer has been struck with this fact on several occasions, and were this an essay on tree planting would doubtless cite chapter and verse, including his own part in assisting to plant a young forest on hill lands in Scotland about twenty-eight years ago. Back about a dozen years ago the first thinnings of that plantation had already been made and the young timber used as fencing posts. The trees were mainly Spruce and European Larch. Yes, it is really wonderful what growth a plantation

will make in fifteen to twenty years even. So with specimen trees when properly taken care of.

Among the grouplets of ornamental flowering trees at Mrs. Willis James' was one of Pyrus-Scheideckeri, one of the prettiest of the Apple family, which seems to become literally wreathed in silvery pink blossoms wherever grown. It never grows into more than a small bushy tree 10 feet or 12 feet high, and is therefore much prized for ornamental grounds. Pyrus Parkeri is equally attractive, although it is not so brilliant, and a fine grouplet was here. A mass of the almost scarlet leaved Platanus Schwedleri, or redleaved Plane, at the front edge of a shelter belt, was conspicuous. It could not be otherwise; but later on it loses its ruddy hues and goes deep green. The Magnolias were also fine, and, of course, Cornus florida in red and white, and the Judas tree, which forms a sort of avenue just inside the eastern boundary of the kept grounds. But the most remarkable special feature here was an irregular belt of Wistaria chinensis -trees, not vines-planted twenty years ago. They were left alone for a time, and then it was seen that the stems were inclined to rise and support themselves. By judicious pruning back Mr. Duckham maintained and developed this character, and now that a broad, irregular, open hedge or belt-like feature has resulted, with the branches averaging 8 feet to 9 feet high, he spurs back the young growth annually, at the end of the growing season, to two eyes from the previous year's wood. In this way he has built up a very beautiful scenic feature and one that is surely unique.

We have seen huge cupolas made of a big iron frame, entirely covered with this Wistaria, and the effect was wonderful when the long lavender racemes hung down on every side and from the roof, and there is a huge Spanish Chestnut not a mile from where we write which is wreathed, roped and garlanded to the tips and extremities of its branches with the blue Wistaria, but of all the ways and means of growing this exquisite climbing shrub, the hedge of it at Mrs. Willis James' is the most striking. Even our friends the Japs might envy this.

A little walled-in garden near the house had to be passed all too rapidly, but not before one had noted the rich variety of harmonious colors in the Pansy and Viola beds of the parterre. The beds were strictly geometrical, upon grass, and charmingly filled. Forget-me-not furnished a sea of blue here, too, but as my impressions are just mental ones, I cannot recall if Tulips were or had been used. At any rate, Daffodils were in bloom on the place, naturalized in the glass, but in a week or a fortnight it was evident they would have run their course for another year.

The vegetable garden, and the reserve flower garden for the supply of cut bloom, lies a little to the west, and contiguous to the ranges of glasshouses. Mr. Duckham is unexcelled as a cultivator of high-class vegetables. The records of the exhibitions bear the proof.

The earliest culinary Peas were half a foot through the soil from a sowing made about the third week in March, while the early Potatoes were also nicely advanced, and numerous other crops were in evidence in the seedling stage in long rows

the seedling stage, in long rows.

In the houses the chief subjects that come to mind were Canterbury Bills, tall-stemmed Godebias, grown

in bunches, and soon to be at their best for flowering. These were from a sowing made last fall. Clarkias (Sutton's Salmon Rose variety) had flowered themselves to death in pots, and were highly prized for their decorative effect and for use for cutting. They are certainly very dainty and elegant, as well as rich and wonderful in their colors.

The old-fashioned but little seen Throatwort (Trachelium caeruleum), a tall, branching plant with pale blue terminal clusters of feathery bloom, also filled a bench and was another favorite. These and several other special lines of greenhouse stock were a welcome and gratifying change from the all too common Cinerarias, Calciolaries, Geraniums and such like, good and useful though these are.

Lastly there were the Peach houses and vineries, reminding one of the best examples of these in English and northern European gardens. The trees in each instance were young, fresh, clean, vigorous and well

cropped.

Not far to the west of Madison, N. J., lies the extensive and beautiful estate of Mrs. McK. Twombley, one of the most varied and noble as to scenery that is surely to be found anywhere in the Eastern States. Far-flung views meet the eye on all hands, and especially looking to the north, where the sky-line forms a bold and rugged contour over the Ramapo Hills. The intervening distance is composed of wood and vale and meadows over many scores or hundreds of acres.

The estate of Mrs. McK. Twombley has as its centerpiece a magnificent classic mansion and splendidly-kept grounds. One carries away distinct impressions of the colonnade of noble Cedars that form a very telling vista from the south front of the house on the lawn, and terminate in Grecian columns and architectural pieces. From whatever angle or point of view these tall, trimly, pyramidal Cedars are seen, they are notable adornments, and never more so than when truly silhouetted against the sky looking eastward. The front and grounds around the house were the conception of Alfred Parsons, the English landscape artist and painter, the practical application of his plans being carried through by Alfred Herrington.

The mansion stands high and the area on the south front is composed of a superb lawn and terrace. On at least two sides there are sunken walled-in gardens, one being devoted to geometrical beds filled with spring and summer bedding plants; the other, which is contiguous, being a Rose garden. The terrace walls are balustraded. There is also a very fine hedge here. formed of Hemlock spruce, which flourishes. lawn is graced with some shapely deciduous trees, and a broad and well-kept carriage and automobile drive, well lighted at night with handsome arc lamps, sweeps easily up the slope and outward to the west. The lawns are the especial pride of Mr. Robert Tyson, the superintendent, who has been eleven years here. A steep bank, heavily clothed with plantings of Berberises in several kinds, Lilac, Dogwood, rugosa Roses and other dwarfed subjects, supports one side of the terrace garden, and on the other the land slopes gradually from the walls into the picturesque park. Roadways, drives and pathways open up other scenic features of the garden and grounds. Everywhere one is struck by the finished appearance, the splendid keeping and the possibilities of the place on its periphery for further good gardening. It may not be giving any secrets to say that Mr. Tyson cherishes the desire to have Mrs. McK. Twombley develop an arc of a shrubbery slope here into a modern rock garden. We venture to suggest that no finer site for an American rock garden could be chosen than the one here referred to, and if the owner's consent is obtained, Mr. Tyson will assuredly create something that his lady and her friends will be proud of and will greatly enjoy. For the sake of the advancement of this lovely feature of gardening, as yet so new and little understood among us, one hopes to see the idea put into practical shape.

Two of these fine outdoor features deserve mention especially, one being the naturalization of May-flowering Tulips in the grass, where it was said they succeed year by year; the second being an extensive planting of Lily of the Valley under shrubs, the latter very openly planted. The "Valley" has become thoroughly naturalized, indeed to such an extent that the plants run out into the grassland that lies beyond. As the plants were heavily sprinkled with their fragrant, pearly-white flowers, the beauty of this large colony can well be imagined. Thirdly, as a termination of the terrace vista, through the statuary, there was a charming mass of pink and white Dogwood, so finely placed and so well developed that nothing seemed wanting to the completion of this remarkable cameo of garden scenery.

The kitchen or vegetable garden is finely walled, the paths being of grass, very fine, smooth and in no way showing any appearance of being worn or patched. The crops were all in excellent order. The

Asparagus beds were notably vigorous.

The range of glasshouses, including vineries, Melonhouses, Peacheries, Palm house, warm plant house and others devoted to flowering subjects are in the best of keeping. The "glass" is somewhat extensive, and there are five trained assistant gardeners besides Italian help. The gardeners have comfortable quarters close by, each man having his own dormitory, and there is a general reading room and recreation room.

Among the plants that are well and liberally grown are Cattleyas, Gloxinias, Crotons (very fine), Adrointum Farlevense, Rhododendrons and Azaleas, in huge tubs. The largest plants are 12 feet across the head. They are housed, together with many other similar summer specimen plants, in a big shed, something like a huge garage, which is heated in winter. At the present season they occupy positions out of doors. Hydrangeas are also among these stately specimens. Carnations are grown in benches, and as soon as the winter crop is through, say by the end of April, the young plants are immediately substituted and are grown on under glass all summer. Allamanda flourishes here, and we noticed the pretty Reidia glaucescens as well. The fruit crops were tip-top, including a house devoted to Melons. These are topped when one fruit has been set, and this alone is left to develop. It was a truly beautiful sight to see a long line of handsome, fragrant Melons there, the variety being Sutton's Jubilee. Out of doors by the glass ranges the reserve flower borders are arranged, as well as hardy borders and flower beds for spectacular effect. One came away from one's all too hurried call thoroughly gratified with the Twombley gardens and their beautiful setting, and feeling that here, as in similar welldeveloped places, there is a vast fund of pleasure afforded to their owners—not forgetting the more solid and material comforts—and satisfied to think that so many are allowed to share it with them. Such places enrich a whole countryside.

#### "THE MOORINGS," MARION, MASS.

The writer recently had the pleasure of a trip over the Converse Estate at Marion, known as The Moorings. Seven years ago Col. Converse purchased eighty acres of woodland on one of the points in Marion jutting out into Buzzards Bay, a very picturesque spot at that time, but now transformed into a veritable "Fairy Land" under the able direction of Superintendent David F. Roy. Soon after entering the grounds one is driven through the natural woodlands the driveway lined with specimen Rhododendrons, both native and hybrids, in perfect condition and well set with buds, promising a delightful picture in the near future. Right here it might be said that Mr. Roy escaped the disappointment so common in this section this spring of having his Rhododendrons either winter killed or seriously disfigured. was done for them last fall in the way of protection except a heavy mulching with leaves to which Mr. Roy attributes his good fortune. Possibly the retentive character of the soil helped carry them through an unusually

The principal show spot, when I called, was the formal garden with its ten to twelve thousand tulips and daffodils all in bloom at once furnishing a gorgeous display not soon to be forgotten. Some of the tulip beds were left undisturbed from last Spring while others were reset. Through the Summer these beds were set with Alyssum and Black Prince Nasturtiums in combination, or with single flowered petunias. The tulips left undisturbed gave two and three flowers each in striking contrast to the single bloom on the full planted bulbs, and

the quality was about even.

A trip through the greenhouses showed the usual run of flowers to be seen in any well kept place, with thousands of bedding stock in prime condition. Conspicuous for excellence among the flowering plants were the French Hydrangeas, Ixias, some of the newer Hybrid Tea roses in pots, Snapdragon, Schizanthus, while in the orchid house were superb specimens of Dendrobium Chrysatoxum.

An out-of-door rose garden containing upwards of a thousand plants of Hybrid Perpetuals and Hybrid Teas

gave promise of future glory.

Another beautiful spot is the "Daffodil Walk" winding a circuitous way through the woods from the gateway to the greenhouse. As one wanders along the walk of pine needles among Nature's unmolested beauty, with clusters of Narcissus of various types dotted here and there among the trees, and does not find therein some sentiment to the soul he must be impervious to Nature's

glory or the horticulturist's art.

The residence itself is perched upon a knoll at the extreme end of the point overlooking the bay and is most beautifully located. As we wander back on the east shore we find a delightful spot known as the Japanese garden, splendidly located in a little dell with its pond and babbling brook bridged with bamboo, together with the products of nature designed to make the whole effect realistic. As we approach the superintendent's home we see the deer reservation with its ten dainty, alert, sleek looking denizens of the forests and wonder how man can have the heart to ruthlessly destroy such dainty creatures.

Last, but by no means least of the attractions visited was the vegetable garden. Here everything showed careful thought systematically executed and bore evidence of prospects of many delicious fruit and vegetables

to gladden the inner man.

Through the generosity of Col. Converse this place is open to the public at all times and is considered one of the show places in southern Massachusetts.

H. F. TURNER.

#### THE SUMMER CARE OF OUTDOOR ROSES.

By a Rosarian.

For practical purposes, roses may be grouped in five distinct classes, namely, Teas, Hybrid-Teas, Baby Ramblers, Hybrid Perpetuals, Climbers and Ramblers.

Of these, the Teas, Hybrid-Teas and Baby Ramblers naturally bloom under suitable treatment from May to October, inclusive. The Hybrid-Perpetuals produce one heavy crop of blooms in June and, under skilful culture, some casual blooms, the number depending upon both the variety and the care which they receive, during the remainder of the season. The name, Hybrid-Perpetuals, is somewhat misleading, the latter word, Perpetual, not meaning that roses of this class bloom perpetually, but that, with proper care, they will continue to live outdoor indefinitely. Climbers and Rambler bloom once each year, in late June or early July, and, as a rule, do not bloom again that season. There are a few exceptions to this last statement; climbing American Beauty, Flower of Fairfield, called by some the Ever-Blooming Crimson Rambler, Christine Wright, and perhaps a few others, under proper treatment will, like the Hybrid Perpetuals, bloom sparingly, after the main crop is over in July, during the remainder of the summer and autumn.

To obtain the greatest number of blooms from the bushes of any of these several classes of Roses it is of paramount importance that we both summer prune the bushes in a correct way and that we cut the blooms in such a manner as to encourage a continuance of the blooming period. Indeed, summer pruning in a large measure is performed in the proper cutting

of the blooms.

We should never break a rose carelessly from its bush if we would like the bush to make the best form of growth, and produce the greatest number of blooms during the season, but we should sever the blooms from their bushes in a systematic, scientific way with some cutting instrument, preferably a sharp knife. The flower buds of the rose are produced on the young growth of the season. When we pick either one bloom, or, in the case of ramblers and other polyantha roses, a cluster of blooms, we should cut the bloom or cluster with a sharp knife, taking with each a stem of such a length as to leave a stub having only one vigorous leaf on it, between the point where the cut was made and the old hard wood branch, or main body of the bush, out of which the young wood, which bore the rose bloom, grew. From the axil of this one vigorous leaf will spring another shoot, which, under favorable cultural conditions, will be robust and thrifty, and on whose tip another rose may appear. Never in picking a rose break or cut clear back to the old hard wood branch or body; never vary from the method of picking suggested, because it seems to you that, if followed, the stem of the rose will be either too short or too long. There is no other correct method of picking roses. If we cut, in picking a rose, clear back to the old hard wood, not leaving a stub of the young wood with a strong leaf thereon, then a new flower-producing branch can spring only from a latent, or adventitious bud on the hard wood, which does not usually happen except under very favorable conditions, and then the branch is often too weak to produce a good bloom. If, on the other hand, we leave a stub of the young wood with several leaves on it, from the axil of each of these will come a shoot more or less weak, which will bear either no bloom or at the best an insignificant one. A young shoot which produces no flower is said to "come blind," and the

(Continued on page 274.)

# Work for the Month of July

Conducted by Henry Gibson, New York.

#### THE FLOWER GARDEN.

With the approaching heat of the July days this department will demand a good deal of attention. We can hardly expect to have sufficient rainfall to supply the needs of the plants in their demand for moisture, so it would be well to make arrangements for having the beds and borders thoroughly watered from time to time with the hose. Weeds should be kept down and the surface soil stirred frequently, which helps to conserve the moisture to a remarkable degree.

Many of the occupants of the hardy border are just commencing to make their best showing, and everything possible should be done to make the most of them. Summer bedding, and potting of chrysanthemums during the month of June take up so much time that it is almost impossible to attend to staking and tying at the proper time. Though this work is apt to prove irksome during the long hot days, yet personal inclinations should be put on one side and an extra effort made to keep up with the work.

Where biennials and perennials are wanted for permanent planting in the fall, the seeds should be sown now, if not already done.

#### LAWNS.

These demand a large amount of attention at this time of the year. A protracted drought soon gives them a brown, burnt-up appearance that is not at all desirable. True, we cannot expect a lawn to present as luxuriant a green color as it does during the early summer months, yet by keeping the sprinklers busy it is really surprising what can be made of it. The grass will not need to be mowed so frequently, and the time thus saved will be well spent keeping the hose and sprinklers busy. Preserve a trim and neat appearance round the walks and drives by keeping the grass edges clipped.

#### THE VEGETABLE GARDEN.

Keep the hoe busy among the crops to preserve the moisture in the soil, as is suggested in the flower garden. If drought is experienced, don't hesitate to flood the vegetable patch with the hose. There is no comparison between fresh succulent vegetables, grown on a well-watered and cultivated piece of ground, and those obtained from ground that has become baked. Beans, corn, etc., may be sown for succession, also lettuce, radish and other salads. Keep tomatoes tied, and prune away the laterals.

The winter supply of celery should be planted out this month. The old method of digging trenches is rapidly being lost sight of, setting the plants in drills drawn in pairs a foot apart and 3 inches deep is the modern method. Of course, it is understood that a space of from 4 to 5 feet is left between each pair of drills, to allow for earthing up. Celery is a marsh plant, and obviously needs copious supplies of water. During dry weather thorough and frequent waterings must be given. There seems to be one advantage in digging trenches and growing by the old method, inasmuch as during long spells of drought previous to earthing up, the hose can be turned into the trench

and the water allowed to run until the trench is full. Early-planted celery will now require tying and earthing up in order to blanch it. Keep a sharp lookout for leaf mining maggot, and burn affected parts as soon as observed.

#### FRUIT GARDEN.

Pot up runners of strawberries, and if the old plantations are past their usefulness, dig or plough them under, and plant to late crops of vegetables. If not needed for this purpose the ground could be seeded to some leguminous green crop to be ploughed under in the fall and thus add to the fertility of the land.

Peaches, apples, pears, etc., should be thinned if the crop is heavy. Summer pruning can be continued.

#### The Greenhouses.

The newly-planted roses are now growing vigorously and will be benefitted by a good mulching of horse manure. Don't use fresh manure, but if none other is available, water it in well as soon as it is put on. Tie up the plants and keep them clean; do not allow them to flower. Let the buds stay on until they are about to show color, and then cut down to the first good eye.

#### CARNATIONS.

Where field culture is adopted the young plants should have every attention in the way of watering, spraying for thrips, pinching and general cultivation in order to have first-rate plants for benching later on. The old plants in the houses are now past their usefulness and should be thrown out. Get the houses ready for planting the young stock. Give the bench a good coating of hot lime and add a good handful of sulphur to each bucketful. If the house is entirely empty, burning flowers of sulphur inside will clean out a good many pests.

#### MISCELLANEOUS PLANTS.

Poinsetteas may still be propagated, and the early-rooted ones potted up as they are ready. Double violets may be planted this month. These require to be carefully watered, good cultivation and fumigating religiously attended to in order to have first-class blooms next winter.

The winter flowering Begonias, Glory de Lorraine and Cincinnati should be potted on as required, using a light compost containing a fair amount of fibrous material. The feeding roots of these plants are very delicate and do not readily penetrate a heavy, firm soil, hence light potting should be the rule. Ample drainage should be provided for, and watering carefully attended to. Shading at this time is indispensable, and a light spray overhead will do much to encourage a free growth.

Calanthes are now making strong, vigorous growth. The atmosphere should be kept moist by several dampings down during the day, but care should be taken to avoid anything like a stagnant humidity at any time. See that the plants do not suffer for want of water, though the other extreme, a wet, sour condition of the soil, is not conducive to their welfare. As the pots fill with roots, weekly applications of diluted liquid manure will be very beneficial, until the flower begins to expand, when it should be discontinued. Thrips should be kept under control by frequent spraying or fumigation.

Gardenias planted early last month will now ad-

vance rapidly, and every encouragement should be given them to make a sturdy growth. On all favorable occasions ventilation should be given, at the same time avoiding direct cold draughts striking the plants. Examine the benches each day for places that dry out more rapidly than others. Gardenias dislike being kept too dry or too wet; the happy medium is the thing to aim at if success is to be obtained. A light dusting of bone-meal will give them something to feed on, and a mulch of well-rotted manure will serve the same purpose, in addition to preventing too rapid evaporation from the soil. Mealy bug is very partial to these plants, but a good syringing every bright day keeps it in check.

Seeds of Schizanthus, Stocks, Mignonette and other winter flowering subjects should be sown this month.

Towards the latter part of the month batches of Freezias, Harrisii Lilies and Paperwhite Narcissus may be planted.

# PROPER CULTURE OF FANCY STRAWBERRIES.

In growing fancy strawberries the soil is of the most importance; next is the variety and then the plan of culture. The best soil for strawberries is that which is so filled with humus that it is alway light and mellow. Soils that have been depleted of humus, or so-called rusty soils, filled with ferments, are not well suited to any crop. Old garden soils that bake down hard should be filled with vegetable matter in the form of strawy manure, cover crops of clover, or other legumes, or perhaps with both.

For growing large, fancy strawberries the varieties that are adapted to the hill system of culture are best because they make long taproots, to gather plant food from the lower layers of soil, and large masses of foliage, to afford more surface to absorb food from the atmosphere. The leaves should be quite immune from blight and the plants fairly productive of large, sweet berries sufficiently firm to stand up forty-eight

hours if picked when ripe.

Success depends largely on having a good supply of plants. For fancy berries grow plants in the fruiting bed only for fruiting—that is, keep the runners all cut

off if plants are grown by the hill system.

When the plants are set, cultivation should begin at once, before the weeds start to grow or the ground bakes. If the cultivator is run both ways between the plants but little hand hoeing will be necessary. If the weather is dry the cultivation should be frequent to keep a dust mulch round the plants to conserve the moisture. It will have much work always to cultivate before the weeds grow. When the runners begin to grow in June the plants should be gone over once a week and the runners cut off with a sharp hoe.

When the ground is slightly frozen is the best time to apply mulching material. Heavy mulching is necessary for obtaining the best results; it retains moisture, holds back the growth of plants in spring, which may prevent injury from a late frost, prevents weed

growth and keeps the berries clean.

When the plants start to grow in the spring rake off the mulch, where it is too thick, between the rows and remove any weeds. Weeds should be taken out even when the plants are fruiting, if the bed is to be carried over in good condition for another year. After a bed is well established I try to keep it five or six years. This may be done with the hill system if the plants are always kept free from weeds.—Country Gentleman.

#### THE SUMMER CARE OF OUTDOOR ROSES.

(Continued from page 272.)

shoot is called "blind wood." As soon as it is seen that a young shoot has "come blind" it should be cut back so as to leave a stub with only one strong leaf on it, just as when cutting a rose from a young shoot. If rose bushes are pruned in the summer and the blooms picked according to this method, we will have no tall, thin rose bushes with weak, bloomless branches, but low-growing, well-shaped bushes on whose young shoots many blooms will be produced.

Other important factors in the summer care of outdoor roses and in promoting their continuous blooming are the weekly stirring of the surface of the soil around the roses and in the entire rose bed, and the fertilization of the soil monthly. There will be little necessity for artificial watering of the rose bed, if at least once each week the soil be cultivated so as to leave it soft and fine to a depth of 2 inches. About once a month there should be worked into the soil all over the rose bed or border, and for 2 or 3 feet around specimen bushes on a lawn, a spread of well-decayed cow or sheep manure from 1 to 2 inches thick. Between these applications of manure during the summer a spread of bone meal thick enough to thoroughly whiten the surface of the soil may be worked in the same way as manure.

If rose bushes are kept well pruned, well fertilized, and the soil in the beds frequently stirred, and they are consequently in a thrifty condition, they are far less liable to the attacks of disease and insects. The prevalent rose diseases are mildew, which causes the foliage to look as if it had been sprinkled with a whitish powder, and to look curled and blistered, and black spot, spots of black appearing on the foliage. The remedy for the former is flour of sulphur or "Fungine" applied to the foliage, and for the latter very dangerous disease, spraying with Fungine will be some help. The most common insects are aphis, thrips, several kinds of small worms, and rose bugs. The remedy for the first three is any of the several commercial nicotine preparations such as Aphine, used as a spray, and for the latter picking off with the fingers and destroying has for years been considered the only sure and safe remedy, since spraying with any mixture strong enough to kill the rose bugs invariably injured the rose leaves and flower buds.

The essential factors then in the summer care of all classes of roses are proper pruning of the bushes and cutting of the blooms, a weekly stirring of the surface and a monthly fertilization of the soil, prompt administration of remedies for diseases and destruction of insects.

#### IMPROVING THE LAWN.

The improvement of an old lawn is a very much more difficult problem than establishing a new one. In many cases it is impracticable to attempt the improvement of an old lawn that is in bad condition, says the U. S. Department of Agriculture. However, if a reasonably good turf obtains, it is possible to better it materially by reseeding, fertilizing, and watering. In the majority of cases improvement is desired in the spring, since at this season many bare spots are in evidence as the result of the preceding winter. If the areas to be improved are small, they can be handworked and reseeded with little difficulty. If they are large, it is usually advisable to spade them up, work thoroughly, and seed, as in the case of starting a new lawn.

In the early spring the soil is usually loose as a result

of the freezing and thawing and is in sufficiently open condition to permit the seed to be covered with little difficulty. After seeding, if the ground has become quite dry, rolling is usually beneficial. Care should be taken when mowing or watering the newly seeded areas to avoid disturbing the young grass.

The management of the lawn after it is once established is an extremely important matter, and there are a few general practices that should be followed carefully. Beginning in the early spring, the first thing to do is to remove with a rake the top dressing that has been applied the fall before. After removing this it is usually advisable to apply some fertilizer, even though the soil is already reasonably fertile. Fertilizing through the season is especially beneficial in keeping the grass stimulated at times when it would otherwise be more or less inactive. Pulverized limestone as a top dressing is very helpful, and an application of this substance can be made either in the fall, winter, or spring. Lime corrects the acidity of the surface soil and is useful in checking the growth of moss and various other plants that are detrimental to the grass.

There is no hard and fast rule to be followed in connection with mowing the lawn, but clipping twice a week is not apt to injure it, and will induce the formation of a good turf. Too frequent clipping, however, is a drain on the vitality of the grass, and frequently results in per-

manent injury.

There is some difference of opinion as to whether clippings should be removed after mowing, but in general their removal is advised, especially during wet weather, since if left to lie on the surface they are conducive to the growth of molds, which in turn produce injury to the turf. On new seedings, however, or where the grass is thin, clippings can frequently be allowed to remain with benefit.

There are probably more mistakes made in connection with the watering of the lawn than in any other phase of its management. The practice of sprinkling as it is almost universally followed is fundamentally wrong, not that the sprinkler does not furnish enough water to the grass during the season, but that it does not furnish it in properly distributed quantities. Sprinkling for a short period may appear to wet the sod thoroughly, but in reality the water does not penetrate much below the surface. This encourages the formation of surface roots and makes the grass less resistant to the severe conditions of weather and usage.

Except in rare cases, the lawn should not be watered oftener than two or three times a week, provided watering is done properly. A thorough soaking is necessary and should be given in the late afternoon or early morning. The point to be borne in mind is that the ground should be thoroughly saturated at each application to at

least three inches in depth.

While weed enemies of the lawn are troublesome throughout the growing season, they are most particularly so from the latter part of June until frost. During this period crab-grass is by far the worst weed present. There is no really satisfactory method of checking its growth, and the only treatment to be recommended is to cut or pull the plants before they have formed large mats. This is a very tedious and expensive practice, but where a good lawn is involved the results justify the expense. Rational fertilizing and careful watering during the summer help to overcome the effect of weeds.

There are many other weeds that are troublesome in the lawn not only in the spring but also in the summer and autumn: Among the most important ones are dandelion, plantain, chickweed, oxeye daisy, and yarrow. While chemical sprays are more effective in the eradication of these weeds than in the case of crab-grass, the best method of preventing their development is to remove them with a spud or similar implement.

The weed problem can perhaps best be solved by making the conditions as favorable as possible for the lawn grasses and to maintain a strict watch at all times to check the growth of the troublesome weeds at the beginning. At the end of the growing season before the severe weather of winter arrives, the lawn should be given a good top-dressing of well-rotted barnyard manure. If the manure is not well rotted, it is likely to introduce an abundance of weed seeds, which will ultimately cause considerable trouble. Top-dressing not only adds fertility to the soil, but gives the grass protection during the severe weather of winter and the freezing and thawing of early spring.

#### AN INTERESTING LILAC EXHIBIT.

An exhibit of lilacs from the famous collection owned by T. A. Havemeyer, of Brookville, Long Island, was staged in the Museum of the Bronx Botanical Gardens under the auspices of the Horticultural Society of New York, in connection with the Bronx gardens. Some fifty vases, each vase containing a different variety, were displayed. The accompanying illustration shows a vase of

THE NEW LILAC LEON GAMBETTA

Leon Gambetta, a new light variety, said to possess great merit. This is said to be one of the most beautiful lilacs in Mr. Havemeyer's entire collection. In addition to the lilacs over a hundred vases of Darwin and Cottage tulips of different varieties were exhibited.

Fyou are a member of a local horticultural society or a garden club and do not find the report of your association's meetings or other events of it in our columns their omission is due to the fact that your secretary has not sent them in. Get after him!

# See America First En Route to Frisco

En route to the 1915 convention at San Francisco the special train of the park superintendents and their friends, in its Chicago-'Frisco journey between St. Paul-Minneapolis and Portland will follow the See America First route of the Great Northern Railway, via Glacier National Park.

Those who will join the party assuredly will see a very great deal of America. Glacier National Park, where the special train will tarry for a day, in many respects is the most wonderful of the National Playgrounds. In the 2,000 miles, besides, of transcontinental tracks that are included in the Great Northern's lines between the Mississippi Valley and Glacier Park, and between Glacier Park and Puget Sound, along every mile there is something of America to see.

At St. Paul and Minneapolis the Great Northern's transcontinental track begins—neighbor cities with a combined population of 600,000 spreading over 100 square miles on both banks of the Mississippi that are two gateways to the Great Northwest. The Great Northern's stone arch bridge spans the river.

Across central Minnesota—from southeast to northwest—the Great Northern tracks follow through the Lake Park region, where Minnesota's 10,000 "lakes of sky-blue water" of the bygone Dakotahs are—a bountiful belt of the "Bread and Butter State." As Minnesota's border is neared, the Red River valley is entered—the bed of glacial Lake Agassiz of the dim time after the Ice Age, during the past half-century famous for its "No. 1 Hard" wheat. At Moorhead (250 miles out from St. Paul) the

Red river of the North, flowing to Hudson's bay, is bridged.

Across the golden grain-carpeted prairies of North Dakota—from Fargo and Grand Forks on the Red river—the Great Northern makes almost straight westward. The richest section of this state that possesses 70,000 farms, 100,000 "big red barns" and 2,000 huge grain elevators—and is really one vast farm of 45,000,000 acres—is traversed.

At Williston (606 miles out), close to North Dakota's western edge, the Great Northern sets a course along the north bank of the upper Missouri river—the "Big Muddy"—in the old steamboat days the route of many big boats bound from St. Louis to Fort Benton, laden for the military posts and the Helena "diggings."

At Mondak (629 miles) the Great Northern enters Montana. So big a state is Montana—only Texas and California are bigger—that 685 miles of the Great Northern's rails are necessary to the crossing of it. For the first four hundred miles of this distance the track is laid across the high plains of northern Montana; that as they outstretch westward gently rise from an altitude of 1,900 feet at the Dakota line to one of 3,700 feet at the foothills. The ride across Montana's wide plains—where vast sweeps of open country everywhere meet the eye, and the sunshine—saturated, clean air is glorious—is a novel one. These plains—today fast developing into an agricultural empire—are rich in romance; much stirring Indian-fighting took place hereabouts in frontier days, and later on this was the land of the Montana long-horn

STEAMER "ST. MARY" APPROACHING GOING-TO-THE-SUN CHALETS, ON ST. MARY'S LAKE, GLACIER NATIONAL PARK.

and the cowboy. Cabins and "false-fronted" stores of the cattle days are yet to be glimpsed—relics of the vanishing old West.

Following the Missouri first—for more than a hundred miles—the track traverses the For Peck Indian Reservation country; on their lands some 1,800 Assinaboine and Yankton Sioux, many of whom took part in Sitting Bull's campaigns, are nowadays thriftily farming. Poplar (692 miles) is the agency headquarters. The Milk river is followed next—for nearly two hundred miles. Much of that grain growing that has made Montana the champion of the United States in bushels to the acre is carried on along the Milk. Near Chinook (894 miles) is the battlefield on which United States troops under General Miles defeated Chief Joseph and his Nez Perces. Near Havre (915 miles) is the old Fort Assinaboine; the Bear Paw mountains, outposts of the Rockies, rise out of the plains.

At Cut Bank in the foothills (1,044 miles, altitude 3,698 feet) the Great Northern begins its climb up the long east slope of the main range of the Rocky mountains—across the reservation of the Blackfeet Indians; 3,000 of that one-time proud nation are here. Browning (1,078 miles; altitude, 4,440 feet) is the agency town.

One thousand and ninety-one miles out from St. Paul, at an altitude of 4,785 feet, the Great Northern reaches the log-built station of Glacier Park, the gateway to Glacier National Park.

The tremendous mountainland of Glacier National Park sits high up in the splendid Rocky mountains of northwestern Montana-on and about the Continental Divide. Glacier Park's mountains outstretch from the Great Northern's track all of the way northward to the Canadian border, and from the reservation of the Blackfeet westward to the Flathead river-a mountainland that is 1,525 square miles in extent. With Mount Cleveland (10,438 feet), Mount Jackson (10,023 feet) and Mount Siyeh (10,004 feet), its generals, a veritable army of magnificent peaks, giants of the divide, for all time is encamped here—peaks that rear from 8,000 to 10,000 feet above sea level, with their bases thickly forested up to the timber line, and their limestone crests by sun and wind painted in many colors—reds and browns, and blues and purples. The "roof of America" is what this region is oftentimes termed; from these heights waters start on journeys west to the Pacific ocean, north to Hudson's bay and south to the Gulf of Mexico.

Atop these mountains are eighty living glaciers that are every bit as inspiring as those ice fields Americans have been crossing to Switzerland to see; of these the great Blackfeet Glacier has an area of five square miles. Up in these high places, too, are droves of nimble-footed Rocky mountain goats—and deer and elk. Among these mountains, in the forested valleys where gorgeous wild-flowers riot, are 250 glacier-fed blue mountain lakes, and scores of noble cataracts and rollicking mountain streams. Many of nature's phenomena are within the park besides—like the Iceberg Lake, where, between flower-carpeted shores, icebergs serenely float the summer through.

At Glacier National Park the superintendents' Special will tarry a day. During this stop-over memorable pilgrimages will be available to the superintendents. By auto-stages they may journey up the 50-mile Automobile Highway to the mammoth new mountain hostelry, the "Many-Glacier." Here, in the park's heart, are beautiful McDermott McDermott Lake and Falls, Grinnell Mountain and Glacier, Gould Mountain, Mount Wilbur, Iceberg Lake, Swiftcurrent Pass and the Garden Wall. By launch they may cruise up St. Mary's Lake, the finest of the mountain lakes of America, to Going-to-the-Sun Chalets, where grand Going-to-the-Sun Mountain is, and

Little Chief and Red Eagle, and Fusilade and Citadel. Or by auto-stage they may gain the Two-Medicine country, where the Two Medicine Lakes and Trick Falls and Rising Wolf, and Appistoki and Triple Divide are.

On westward from Glacier Park the Great Northern sets its course along Glacier Park's southern boundary, the only transcontinental track in the United States that lies alongside a national playground.

Summit (1,104 miles) marks the spot where the Great Northern scales the Continental Divide—through that gap in the Rockies that's called Marias Pass—5,202 feet above sea-level.

The ride down the steep west slope of the main range of the Rocky mountains—from Summit down to Columbia Falls—is a fine one. In a distance of 60 miles the railway descends 2,100 feet; in the first fifteen of these miles the descent totals 1,200 feet. The track lies all among majestic mountains, among the tall pines of the Flathead National Forest, and follows close beside rushing mountain streams—Bear Creek first, the middle fork of the Flathead river next, and finally the Flathead itself. From the horseshoe curve at Skyland a wonderful view is had down into the Bear Creek Valley, its floor a thousand feet below the railroad. The middle fork of the Flathead, from Java station followed for 35 miles, is a mountain river particularly beautiful. Belton (1,149 miles) stands at the western gate to Glacier Park.

Then from Rexford (1,234 miles) the Great Northern Railway does some more mountaineering—through the canyon of the Kootenai. The Kootenai river has its source in the high glaciers of the Canadian Rockies, hastens southward into the States—a big, vivid-green river—and among the west spurs of our own Rockies describes a wide horseshoe through the northwestern corner of Montana and the "Panhandle" of Idaho. Entering the Kootenai's canyon at Rexford, crossing the Montana-Idaho line just beyond Yakt (1,314 miles), and leaving the canyon at Bonner's Ferry (1,339 miles), the Great Northern for 105 miles follows this horseshoe of the Kootenai's—through the Wolf Range, the Purcell Range and the Cabinet mountains—another very fine rail ride

The Kootenai National Forest, the Libby Creek and Yakt river placer gold fields, the lively saw-milling towns of Libby in Montana and of Bonner's Ferry in Idaho; the rugged Cabinets where mountain lions and bears roam—these are interesting things in and about the Kootenai Canyon. Out of Idaho (from Sand Point 1,372 miles) the track follows another brawny and green mountain river—the Pend Oreille.

The State of Washington the Great Northern enters at Newport on the Pend Oreille (1,391 miles); 1,447 miles out from St. Paul the Great Northern reaches Spokane.

Spokane, about the mighty falls of the Spokane river—makers of 400,000 horsepower for electrical purposes—is the hub of eastern Washington, of Idaho and of western Montana—of what's called the Inland Empire. Spokane in 1880 was a village of 300; today, with 120,000 people, it's Washington's second city. In the shelter of the Cabinet and Coeur d'Alene ranges, a chain of fine apple-growing valleys surrounds it. Hayden Lake—an hour away—is a delightful resort in the Coeur d'Alenes.

Westward from Spokane the railway makes across the high prairies of the eastern Washington Big Bend country—taking its name from the big bend of the Columbia river off to the north and west of it—a wheat-growing land of 7,000 square miles.

From the little depot that's called Crater (1,590 miles) the Great Northern descends from the highlands to the east bank of the mighty Columbia—by a track that winds down the walls of the weird, volcano-rent Crater Coulee.

The railway follows up the Columbia, beneath its basalt l'alisades—beyond Rock Island (1,610 miles) the rail-

way bridges it.

Wenatchee on the Columbia (1,621 miles) is the hub of the Wenatchee Valley, the "Land of the Big Red Apple." A generation ago this was a desert of volcanic ash, where only sage-brush grew; today under irrigation the Wenatchee Valley, from end to end is one vast orchard that bears "big red" Wenatchee apples that are shipped even over-sea.

Up the Wenatchee Valley the transcontinental track heads toward the Cascades—through the spurs of the Wenatchee range and alongside the snow-fed Wenatchee

river, hurrying down from Glacier Peak.

Leavenworth (1,644 miles), altitude 1,165 feet, stands at the eastern base of the main range of the Cascade mountains; here the Great Northern begins its scaling of the Cascades—the most wonderful ride by rail in all America. A second big locomotive—a "helper"—is

coupled to overland trains.

Tumwater (Talking Water) Canyon the railway enters immediately, and for ten sharply-climbing miles the track twists up this wonder place—a tremendous cleft where the Wenatchee tumbles and foams between mountains forested with firs, hemlocks, spruces and cedars of the Wenatchee National Forest, and so high that never-melting snow lies in the shadowed crevices about the crests of them. Rare bear, deer and goat hunting is hereabouts.

Nason Creek Canyon the railway climbs from Nason Creek station (altitude 2,153 feet)—another tremendous cleft in the mountains with brawling Nason Creek at its

bottom.

From Cascade Tunnel station (1,677 miles), at 3,375 feet altitude, the Great Northern through the Cascade

Tunnel passes under the ridge of the Cascades.

Tye (1,680 miles) stands at the west portal of Cascade Tunnel, and is perched high up on the north wall of Tve River Canyon; here the Great Northern begins the descent of the Cascade's west slope—the track following a shelf along the canyon's wall. The "doll's house" that's glimpsed from this high track, down in the canyon, is the big hotel at Scenic Hot Springs. The shoulder of Windy Point is tunneled. A bit further on the track bridges the chasm of Martin's Creek and runs the unique Martin's Creek Tunnel—both of whose portals are east portals, and which describes a complete down-hill horseshoe in the mountain. At Scenic the railway horseshoes into the west again—a descent of 1,007 feet in 9 miles of track at that delightful mountain resort, in the Snoqualmie Nation Forest, Scenic Hot Springs. Skykomish (1,701 miles), 1,168 feet below Scenic, marks the bottom of the descent of the main range of the Cascades.

The salt waters of Puget Sound, the Great Northern reaches at Everett (1,753 miles)—and from Everett southward to the three wonder cities of the Pacific Northwest, Seattle, Tacoma and Portland—still another fine rail ride—the Great Northern, over what's nicknamed the "Coast Line," makes through the delightful Puget Sound country and the interesting lower Columbia region.

# PARK SUPERINTENDENTS' ITINERARY TO SAN FRANCISCO.

The itinerary of the American Association of Park Superintendents' trip to San Francisco is now complete and being distributed. An invitation has been extended to the members of the National Association of Gardeners, and to members of all horticultural societies to join the park superintendents on their trip to the Pacific coast and return, to attend the several conventions to be held in San Francisco the third week of August.

The party will leave New York on Saturday, August 7,

arriving at Chicago the following morning. Leaving Chicago that night the party will arrive at Minneapolis on Monday morning and continue its trip that night, traveling through North Dakota and Montana, reaching Glacier National Park, Montana, on Wednesday morning. After spending a day at the park in sightseeing, the party will arrive at Spokane, Wash., the following morning. It will leave for Seattle that night, arriving there the following noon. The next morning a Puget Sound steamer will be boarded for Tacoma, which city will be reached about noon. The following morning the party will arrive at Portland, Ore., departing in the afternoon for San Francisco, where it will arrive late on Monday afternoon August 16.

After a week's stay in San Francisco the party will continue its trip on Tuesday, August 24, for Los Angeles, Pasadena and the San Diego Exposition, in which cities

four days will be spent.

Departing from San Diego on Sunday morning, August 29, the next stop will be at Salt Lake City on the following day. Pueblo, Colo., will be reached on Tuesday afternoon, where a short stop will be made for sight-seeing, and Colorado Springs on Wednesday morning. Leaving Colorado Springs the following morning the party will arrive at Denver at noon of that day, remaining until night and arriving at Kansas City, Mo., the following afternoon, leaving that night for St. Louis.

Arriving at St. Louis Saturday morning the members of the party will separate that evening, those traveling to Chicago arriving at that city on the following morning; those for New York, Philadelphia and Washington arriving in the eastern cities early on the morning of September 6.

The round trip fare over the entire route, including lower Pullman berth, will be: From New York, \$164.80; Chicago, \$159.20; Washington, \$151.95; Buffalo, \$140.50; Chicago, \$114.50; Minneapolis, \$105.95.

Fickets are good for ninety days, so that those who may desire to leave the party in California and extend their trip on the Pacific coast, or in Colorado, to visit Yellowstone Park, can do so by making arrangements for the homeward trip when purchasing tickets. Return trip can also be made from California via the Sunset Route to New Orleans, thence by the Southern Pacific steamers to New York at no additional fare.

Complete details and copy of the itinerary may be had by applying to Herman W. Merkel, chairman Transportation committee, American Association of Park Superintendents, Zoological Park, New York; M. C. Ebel, secretary, National Association of Gardeners, Madison, N. J., or any of the offices of Thomas Cook & Sons, tourist agents.

No. 6.

#### NATIONAL ROSE GARDEN DEDICATED

The dedication of the National Rose Garden occurred in Washington, D. C., on June 3. Many public officials were present and the rose industry was well represented by a number of men prominent in it.

The ceremonies were presided over by Robert Pyle, of West Grove, Pa. Dr. William Tayor, chief of the Bureau of Plant Industry, Department of Agriculture, represented Secretary of Agriculture Houston, who was unable to attend owing to other official engagements.

Wallace R. Pierson, president of the American Rose Society, presented the Rose Garden to the Department of Agriculture, which was accepted by

Chief Taylor on behalf of that Department.

Addresses followed by Professor L. C. Corbett, David Fairchild, Dr. W. Van Fleet, Peter Bisett, all of the Department of Agriculture, and Benjamin Hammond, secretary of the American Rose Society. When William F. Gude proceeded to formally dedicate the garden, it might have been more fittingly termed a christening, as his address was made during

a heavy downpour of rain.

Following the dedication services the guests were entertained by Mrs. C. C. Bell, of Washington, at "Twin Oaks," where she has a beautiful rose garden. Mrs. Bell is the daughter of Mrs. Hubbard, donor of the Hubbard Medal.

#### AMERICAN SWEET PEA SOCIETY'S SHOW.

A meeting of the joint committees of the Newport Horticultural Society and Gardeners' Association of Newport was held recently, which Harry A. Bunyard, secretary of the American Sweet Pea Society, attended. All arrangements were completed for the annual show, which is to be held at the Casino, Newport, R. I., on July 8-9.

The final schedule will be issued about June 20 and may be had by applying to Harry A. Bunyard, secretary, 40 West Twenty-eighth street, New York City. Everything indicates that the coming show will be one of the finest sweet pea shows ever held in this country. Reports coming from the vicinity of Newport say the outdoor sweet peas are looking well in that locality.

Keen competition is looked for, also a large attendance of visiting gardeners from New York and from the New England States. A large delegation from New York will attend the show, leaving on the Fall River steamers on Wednesday, July 7.

#### THE CLEVELAND FLOWER SHOW.

The Premiums Committee of the Cleveland Flower Show has decided to include classes in vegetables in its show. The committee is at work at the present time on the arrangements of the premium list for the vegetable department of the show and expects to have this ready for mailing within a few days. Gardeners desiring to obtain copies of this special list can secure them by addressing Herbert Bate, 356 Leader building, Cleveland.

Plans are on foot to organize personally conducted trips to start from New York, Boston and Philadelphia in the East and Chicago in the West to visit the Cleveland Flower Show. It is expected that there will be enough interested in the Cleveland show from each of these centers to make a special train possible. Further details of these plans will be announced in the July issue of THE GARDENERS' CHRONICLE.

The Cleveland Garden Club, co-operating with the Ohio Horticultural Society and the Cleveland Florists' Club in promoting the Cleveland Flower Show are at work securing a large list of special prizes among their members. This will make the final list of premiums much larger than as announced in the preliminary list.

#### THE NATIONAL FLOWER SHOW.

The National Flower Show Committee met recently in Horticultural Hall, Philadelphia, with Chairman Farenwald presiding. John Young of New York was present.

Practical details for the conduct of the National Flower Show, to be held in Philadelphia March 25 to April 2, 1916, were more or less definitely worked out.

At a meeting with the same committeemen, Mr. Frederick Newbold of the New York Horticultural Societywho did so much towards making a success of the New York Show—was present, and explained in detail the plans and methods pursued by that organization in connec-W. F. Therkildson, tion with the New York Show

Chairman of Press and Publicity Committee.

### NATIONAL ASSOCIATION OF GARDENERS

JOHN W. EVERITT, President, Glen Cove, N. Y.

OFFICIAL COMMUNICATIONS

M. C. EBEL, Secretary, Madison, N. I.

#### ASSOCIATION NOTES.

The executive meeting of the association's trustees and directors will be held in New York City early in July to complete plans for the summer meeting to be held in San Francisco during the third week in August next, and also take action on such other business as may be brought before the meeting.

Attention is directed to the following resolution which was adopted by the board:

"In view of the national character of our association, our president has rightly appointed to the Executive Board members residing in all parts of the country. At the same time it is obvious that the attendance of all members of whatever place meetings may be held is practically an impossibility. As it is essential that every member of the Executive Board should take an active interest in the welfare of the association and should have opportunity of doing so afforded him to make suggestions in connection with, and offer opinions upon the policy of, the association; therefore be it resolved, That an invitation be extended to the members of the Board, that when they cannot attend a meeting they submit any suggestions they may have to offer in writing that can properly be brought before the meeting, and, that it shall be given the same consideration as though the member offering it were present in

The Cooperative Committee will submit the proposal received from the Nassau County Horticultural Society, published in the April issue of the Chronicle, at the Executive Meeting in July, which recommends that members moving from one district to another be accepted through transfer from the local society with which they have been affiliated. The committee will also be glad to hear from any of the local cooperative committees on any recommendations that they may have to submit that can be brought before the Executive Board. Communications should reach the committee not later than July 1 and can be forwarded in care of the secretary of the association.

The Committee on Bird Protection reports that it is enlisting the cooperation of the officials of the principal organizations concerned with the protection of birds and that it is meeting with very favorable results. As the success of this committee depends to a large extent on the cooperation of individual members, the committee urges that all members interested respond to the appeal made in its report which was published in the May number of the Chronicle. Communications should be addressed to the chairman of the committee, L. P. Jensen, superintendent of the Busch Place, St. Louis, Mo. A committee consisting of Herman W. Merkel, New York; J. H. Prost, Chicago, Ill.; Theodore Wirth, Minneapolis, Minn.; C. L. Brock, Houston, Texas of the American Association of Park Superintendents has been appointed to cooperate with our committee.

The Essay Committee reports that there has been little or no interest shown to date in the contest for President Everitt's prize, due in all probability to the announcement being made just at the beginning of the busy season. It again directs attention to the contest and to the following subjects:

Class 1-Prize \$35 gold.

Subject—Horticulture as a Profession. From the Standpoint of a Gardener.

Class 2-Prize \$25 gold.

Subject The Proper Grouping and Culture of Trees, Shrubs, Perennials and Annual Bedding Plants in the Ornamentation of Private Grounds,

Class 3—Prize \$20 gold.

Subject—Preparation of Ground for and General Treatment of Hardy Herbaceous Perennials. Naming a list of species (limited to one hundred) providing a succession of flowers throughout the entire season.

Class 4—Prize \$20 gold.

Subject—How to Secure a Year's Vegetable Supply With the Aid of Cold Frames or Hotbeds (but no greenhouses), Including Soil Preparation

The contest will close on October 1, the judges to report their decision at the next convention of the association, to occur the first week of December.

Contestants will address William H. Waite, Chairman of Essay Committee. National Association of Gardeners, P. O. Box 290, Madison, N. J., for further particulars.

There are many members in the association qualified to enter this competition and the committee urges that the members show their appreciation of the President's generosity by entering the competition. Members contemplating attending the summer meeting in San Francisco and accepting the invitation of the American Association of Park Superintendents to join their party in the trip to the coast, should communicate with the secretary without delay so that accommodations may be reserved for them. A brief outline of the itinearary is published on another page in this issue. Complete information and copy of the itinerary will be sent to any member applying to the secretary's office. The party will leave New York on August 7—Chicago August 8 and will be due in New York to return on September 6.

#### AMONG THE GARDENERS

Alexander Michie, formerly superintendent for C. A. Stone, Plymouth, Mass., has been appointed superintendent of the Memorial Cemetery, Cold Spring Harbor, Long Island, taking office on June 1. Before accepting the position Mr. Michie was engaged for several months superintending the landscape work of the cemetery under Olmsted Brothers, Brookline, Mass.

W. R. Fowkes resigned his position as head gardener on the Howard Cole estate, "Brooklake," Madison, N. J., to accept a similar position on the Clark estate, Cooperstown, N. Y. Mr. Fowkes entered on his new duties early this month.

Joseph Dexter, formerly superintendent of the Whitelaw Reid estate, Purchase, N. Y., has taken charge of the private grounds and greenhouses of "Brooklake," the estate of Howard Cole, Madison, N. J.

Harry B. Keiller, who took charge of the Alexander R. Peacock estate, Pittsburgh, Pa., last August, has recently had a fine display of roses in his greenhouse range, which is quite an extensive one. Chrysanthemums and carnations are also extensively grown, and more than a thousand cyclamen occupy the house at the present time.

J. F. Zimmerman, in charge of the old William Carr Estate, Point Breeze, Pittsburgh, Pa., for the past year has been doing some independent work since the death of Mrs. Carr, which has stopped all improvement work for the time being on this estate. He has recently completed the new grounds for James R. Starrett, one of the finest places on Squirrel Hill.

Thomas Hambleton has secured the appointment of superintendent of the Garneau Estate, Kingston, N. J., a new place of 150 acres, on which considerable development work is now under way.

Robert Grindrod, formerly of Greenwich, Conn., has secured the position of superintendent on the 6,000-acre estate of Dr. Clarence Fahnestock, Cold Spring, N. Y., which was recently purchased and on which improvements, both in a horticultural and agricultural way, will be made on a large scale.

# TREE PLANTING BY PITTSBURGH SCHOOL CHILDREN.

Superintendent of Parks George W. Burke is largely responsible for the most generally distributed scheme of horticulture ever attempted in Pittsburgh: the planting of 20,000 catalpa, hard maple and mulberry saplings donated by the city council to the children of the public schools, one to every five children, during the past month. Accompanying each consignment of trees were minute directions for planting, culled from the best knowledge of tree nurseries, assuring a crop of perfect trees in future Not a school in the city was overlooked, those in the congested districts receiving as well as those in the outlying, the only discrimination being as to number according to the neighborhood's availability for tree culture. The distribution included 10,000 catalpas and 5,000 of each maples and mulberries. The tree planting, while the biggest project attempted in the public schools, is by no means all that the schools are doing in the way of planting. For several weeks flowers have been blooming in practically every school in the city. Creation as applied to plant life is a big part of the work in the 92 kindergartens and many flowers and vegetables are growing in gardens surrounding the schools, where there is such space, or in boxes in the windows, or in the backyards of neighbors loaned for the purpose.

#### AMERICAN ASSOCIATION OF PARK SUPERINTENDENTS

OFFICIAL COMMUNICATIONS.

G. X. AMRHYN, Pres., New Haven, Conn.

R. W. COTTERILL, Sec.-Treas., Seattle, Washington.

#### ASSOCIATION NOTES.

President Amryhn has appointed the following committee to cooperate with the Committee on Bird Protection of the National Association of Gardeners:

Mr. Herman Merkel, of New York, N. Y.; J. H. Prost, of Chicago, Ill.; Theodore Wirth, of Minneapolis, Minn.; C. L. Brock, of Houston, Texas.

The chairman of the committee of the gardeners' association is L. P. Jensen, St. Louis, Mo., who is also a member of our association.

Members are reminded that proposed amendments to the constitution and by-laws must be filed in writing with the secretary, at least thirty days prior to the date of the annual meeting, which will mean July 18.

A copy of all proposed amendments will be published in these columns or sent to each member for consideration prior to the convention.

The secretary has in mind submitting two amendmnts, one a general reconstruction of Article 2, dealing with classification of members in order to make the same consistent with various amendments which have been made during the last few years; another fixing the admission fee at \$10 which shall also cover the first year's dues.

Convention time is fast approaching and there is every indication that the attendance will break all previous records. Persons who intend joining the special train party should notify Herman Merkel, Zoological Park, New York City, who is chairman of the Transportation Committee.

The special train will start from Chicago and eastern parties will try and arrange special car groups to Chicago. Persons from the Middle West can get their tickets via Chicago or Minneapolis and join the main party at those points.

Elaborate preparations for the entertainment of the special train party are being made by our members at Chicago, Minneapolis, Spokane, Seattle, Tacoma and Portland and the Great Northern Railway Co. is going to see to it that our party has a big day at Glacier National Park.

If you miss this special train party you will regret it as it will be the last word in convenience of travel and a trip through a scenic wonderland with stop-overs at cities which have progressed very rapidly in modern park development during recent years. There will also be entertainment free which ordinarily would amount to a hundred dollars of expense. Remember that your relatives and friends or members of kindred organizations are welcome to join this party and take advantage of these features.

Secretary Cotterill met with the local committee at San Francisco on the 14th inst. and completed all details of arrangements for the convention. A preliminary program and circular of information will be sent to all members, prospective members and various Park Boards, about July 1, and it is to be hoped that this will result in arousing interest in the trip.

Just east your eye over this list of horticultural and pomological conventions which will meet in San Francisco at about the same time:

August 12-14, Pacific Coast Association of Nurserymen; August 17-20, American Rose Society; August 17-20, Society of American Florists and Ornamental Horticulturists; August 17-20, National Association of Gardeners; August 18-20, American Association of Park Superintendents; August 23-25, American Pomological Society. These conventions will undoubtedly bring together the greatest assembly of men of kindred professions in the history of the country.

Here is a point to remember when buying your ticket, if you intend to visit the San Diego Exposition. San Diego is a side trip from Los Angeles and not on the main route and it is necessary to get a special stub-ticket, which will cost you nothing extra, but you must demand and procure it at the time and place where your general ticket is purchased. Get this ticket whether you intend using it or not, as you may change your mind when you learn of the remakable horticultural exhibit at San Diego. The exposition is located within one of the city parks and the exhibits and land-scape work are something which every park man should see.

St. Louis is the first city to file an invitation for the association to hold its 1916 convention in their city. Ernest Strehle, Superintendent and Nelson Cunliffe, Commissioner, join in extending a very cordial invitation and promise entertainment and instruction which will long be remembered.

Members who can and will deliver papers or addresses at the convention are requested to send the information and the subject to the secretary at once, in order that the information may be included in the preliminary program which will go to press about June 25. Select your own subject but make it something of general interest and not merely a local review, also be prepared to handle all questions which may come up in the discussions which follow.

There has been some complaint that at recent conventions we have had so much entertainment and so little of papers and discussions, that this year the officers have decided upon a full day and evening for this purpose, prior to any sight seeing trips or social functions, so it is up to the members to supply the material. Now don't be modest, decide on what you can write or say that may be helpful to the others and notify the secretary at once.

#### PARK DEPARTMENT PERSONALS

The annual repot of the Minneapolis Park Commission, issued recently, is without a doubt the most artistic publication of its kind put out by any city in the country. Brother Wirth has had a great opportunity in Minneapolis and has been fortunate in having back of him a fine Park Board and a most loyal and efficient organization, the result being quite apparent to any one who has visited Minneapolis and inspected its wonderful park sytem.

It certainly pays to advertise and the type of annual report by the Minneapolis Park Board, inspires confidence and wins support at home and also exploits the city abroad.

Richard Iwerson, formerly of Calgary, is now stationed at the Washington State Reformatory at Monroe, Washington, as land-scape engineer.

Andrew Balmer, formerly of Vancouver, B. C., is also stationed at this fine new institution and when they write the secretary they accuse him of trying to place our Canadian brothers in the reformatory. However, they have a fine opportunity to develop the grounds of what is going to be one of the finest institutions of its kind in the country.

The St. Louis Park Department Association is an organization which might well be patterned after in other cities. This association has 300 members, all employes of the St. Louis park department and was organized over two years ago for the purpose of promoting good fellowship and efficiency in the department. Instruction classes, lectures, debates and social functions all contribute towards this end and are producing wonderful results.

Ernest Strehle, local superintendent and one of our members, was the organizer of this association and Dwight Davis, former Commissioner and L. P. Jeusen of Busch Park, also members of our Association, were important factors in the building up of the organization. We hope to have a paper on this subject presented at the convention by one of these men.

James O. Convill, the new superintendent at Portland, Oregon, Thomas W. Shimmins, superintendent of Cameron Park, Waco, Texas and John D. McEwan, superintendent of Queensborough, New Work City, have filed applications for membership and will attend the San Francisco convention.

Remember the mark has been set at fifty new members for this session, so get busy and do your part.

Portius C. Deming, president of the Minneapolis Park Board, has just completed a tour of the Pacific Coast and Messrs, J. W. Thompson and Secretary Cotterill were graced by a few days visit at Seattle. We feel sure that Mr. Deming will testify that the Association is making no mistake in having its special train party visit the Pacific Northwest.

Martin C. Ebel, editor of the CHRONICLE, spent a day with President Amrylin last month and had an opportunity to inspect the beauties of the New Haven park system. The secretary hopes that he was also able to induce Mr. Amrylin to contribute something to these columns in the future, a pleasure we have been denied heretofore.

#### PARKS AND THEIR USES.

The word "park" originally in English referred to a place for the preservation of deer for the chase, and was characterized by broad stretches of pasture and woods and contained ponds or running water, rustic bridges, thickets of bushes, water, trees, etc. But of late years the word park may designate the grounds surrounding a private estate, a recreation ground known as a large rural park, a small city park, a neighborhood pleasure ground, a square, a place or a garden, parkways or boulevards or outlying reservations; in fact, the word may mean almost any form of a recreation place where trees and shrubs form a part. One of the practical things a park man should understand is the proper use of each of the foregoing places.

Our large Chicago parks were originally intended as breathing spots, where the tired business man or city worker could relax by strolling, picnicing or driving, sit on grass or otherwise enjoy and rest himself in a quiet way, and very little attention was given to space for such games as tennis, baseball, golf, etc. As the city continues to grow the demand for space in our parks for these games is continually increasing until a point has been reached where the original purpose of the park is lost track of and the large parks, such as Lincoln, Jackson, Washington, Humboldt, Garfield and Douglas are rapidly being converted into playgrounds. I believe that this is wrong and that no more space should be alloted in these parks for games for the following reasons, unless, of course, more space is provided. We have nine classes of park visitors, as I see it, as follows:

Class 1—Children, boys and girls, up to 12 or 14

vears of age.

Class 2—Young men and young women, from 14 to 21 years of age, not accompanied by parents.

Class 3—Adults, couples of men and women or

company.

Class 4—Adults, men, single or in groups of two or more.

Class 5—Adults, women, single or in groups of two or more.

Class 6—Family groups, man, wife and children, or picnic groups.

Class 7—Automobile drivers and those using conveyances.

Class 8—Equestrians.

Class 9—Invalids and old people.

Taking all of the foregoing classes into consideration, it is obvious that no one park, even of a very large extent, can furnish adequate accommodations for all, especially when you take into consideration the many forms of recreations usually pertinent to a large park, such as band concerts, croquet, roque, casting clubs, rowing, boat clubs, archery, bicycle races, large picnics, bathing, celebrations and many other forms of recreative events which bring together at one time large groups or crowds in addition to the visitors who are interested only in floral displays, the zoological garden and similar attractions and those who simply pass through the park on their way to and from work or for other reasons.

The main purpose of a large city park is to furnish a means of relaxation to the great mass of city toilers from the routine of city life and who find recreation in simply strolling among the trees and flowers, rest the eye on green grass, breathe the fresh air and return to the crowded homes refreshed. Since the great growth of population, and perhaps great growth of

popularity of our large parks were not adequately conceived, or, for other reasons, we now find them too congested for all recreation features, it behooves us, therefore, at this time to study means by which the greatest number of people can find recreation in the limited area available. In order to do this intelligently it is necessary to draw distinct lines betwen play and other forms of recreation. By play I mean tennis, baseball, football or any other form of athletics wherein competition plays a part, also gymnastics of all kinds, etc., etc. For this form of play the park space is limited. By recreation I mean concerts, seeing the animals, seeing the flowers, in and out of the conservatory; picnics, boating, promenading and young couples communing with nature and planning their future.

Having made a careful analysis of the kinds of people who visit the parks and the kinds of games played and the various recreations sought, we next proceed to divide all play and forms of recreation into two classes.

These games and forms of recreation which can be best enjoyed and managed in a limited area should be confined to small parks, school buildings, field houses or vacant lots, and the other forms of recreation are those that can only be carried on in a large park. The result will show that the small parks and playground movement is of the greatest importance, because, as I said before, the areas and facilities in large parks are limited, while the field for advancement in the playground movement can go forward for many years, or as long as there is vacant property or property with old, cheap buildings that can be purchased for a reasonable price. Then, too, I believe the public school buildings should be available for many forms of recreations, such as lectures, concerts, meetings and even dances.

While I believe that our present fine field houses now operated by our park systems are none too good for the purpose, the initial expense for these buildings is enormous. If we expect to expand rapidly in the playground movement, we must save our money for the purchase of land for playground field houses and construct cheaper buildings. On the other hand, I also believe that all games and recreations in the playgrounds should be properly supervised and directed, so that children may be taught the value of correct methods and that fairness shall prevail. Without supervision, a playground will soon lose its effectiveness in the community and will be ruled by a few persons or by a gang, who will make others feel that they are unwelcome.

Time will not permit me to dwell longer on this subject. In conclusion, however, there are three points I

wish to emphasize:

First—We must stop crowding our large parks with games and recreations that can better be taken care of in the small playgrounds for the reason that if we continue, the large parks will be ruined for the purpose for which they were originally intended, viz., that of furnishing rest and rural recreation for the great mass of city workers.

Second—When this point is well considered, it will readily be seen that the field of endeavor for our pres-

ent needs lies in the playground movement.

Third—When the dividing line between large parks and playgrounds is closely understood, park workers and playground workers will then join hands and operate in perfect harmony.

[Address by Superintendent E. A. Kanst, of Lincoln Park, Before the Chicago City Club, May 19, 1915.]

# Our Native Birds' Protectorate

Under the direction of the Committees on Bird Protection of the National Association of Gardeners and American Association of Park Superintendents, L. H. Jensen, St. Louis, Mo., Chairman.

#### THE ECONOMIC VALUE OF BIRDS.

Abstracts from Dr. William T. Hornaday's "Our

Vanishing Wild Life.'

"TO MY FRIEND THE EPICURE: The next time you regale a good apetite with blue points, terrapin stew, filet of sole and saddle of mutton, touched up here and there with high lights of rare old sherry, rich claret and Dry Monopole, pause as the dead quail is laid before you. on a funeral pyre of toast, and consider this: 'Here lies the charred remains of the Farmer's Ally and Friend, poor Bob White. In life he devoured 145 different kinds of bad insects, and the seeds of 129 anathema weeds. For the smaller pests of the farm, he was the most marvelous engine of destruction that God ever put together of flesh and blood. He was good, beautiful and true; and his small life was blameless. And here he lies, dead; snatched away from his field of labor, and destroyed, in order that I may be tempted to dine three minutes longer, after I have already eaten to satiety.' Then go on and finish Bob White.

"The millions of the insect world are upon us. The birds fight them for us, and when the birds are numerous and have nestlings to feed, the number of insects they consume is enormous. They require absolutely nothing at our hands save the privilege of being let alone while they work for us. In fighting the insects, our only allies in nature are the songbirds, woodpeckers, shore-birds, swallows and martins, certain hawks, shrews, bats and a few other living creatures. All these wage war at their own expense. The farmers might just as well lose \$8,250,000 through a short apple crop as to pay out that sum in labor and materials in spraying operations. And vet, fools that we are, we go on slaughtering our friends, and allowing others to slaughter them, under the same brand of fatuous folly that leads the people of Italy to build anew on the smoking sides of Vesuvius, after a dozen generations have been swept away by fire and ashes."

"In view of the known value of the remaining trees of our country, each woodpecker in the United States is worth twenty dollars in cash. Each nuthatch, creeper and chickadee is worth from five to ten dollars, according to local circumstances. You might just as well cut down four twenty-inch trees and let them lie and decay, as to permit one woodpecker to be killed."

#### WIN BACK OUR NATIVE BIRDS.

By Joseph H. Dodson, Illinois.

The great awakening all over this country to the importance of saving our native birds is particularly interesting to all who have gardens. The birds are Nature's own agents to help us protect and improve our gardens. But for our native birds the insects would destroy all growing things. Yearly we have increased our expenditures in fighting insects by sprays and applications of chemicals. Altogether there are millions of dollars spent in America each year in fighting insects and still not less than \$500,000,000 are lost through the ravages of those insects we cannot utterly destroy. Scientists say the gypsy moth, if unchecked, would completely defoliate all the trees in this country within eight years.

And you know the birds are the best aids to man in fighting this moth. For better trees, better flowers, more and better fruit we need more American birds. And the birds are willing to come, hungry and eager for work in our behalf. How, then, shall we help increase our bird workers?

Our first care should be for the protection of our native birds. Wage the holy war on the English sparrow, the quarrelsome pest that has driven so many of our birds away. Protect the birds from the cats, particularly stray cats. E. N. Forbush, State Ornithologist of Massachusetts, estimates that cats kill 700,000 birds a year in his State alone. The damage done by cats is appalling. Red squirrels also war on our birds.

It is very easy to trap English sparrows and to trap

cats.

A bird bath is one of the very best means of attracting birds. They are not costly if bought ready made, not hard to make for yourself. The birds love to frequent the gardens where a bath is always ready for them; particularly if they are given protection against cats.

For twenty years I have studied and worked for birds. During that time I have discovered, by actual experience, just what these dear little fellows want in the way of houses and shelter shelves or invitations to nest.

In choosing the kinds of houses you are going to put out, you should consider first the birds which usually come to your neighborhood every year. Wrens, bluebirds and purple martins are generally found in most neighborhoods and these birds are very easily won to suitable houses. Robins, cat birds, cardinals, grossbeaks. brown thrashers and scarlet tanagers can be attracted by a sort of shelter shelf, in which they build their nests. Chickadees, flickers and tree swallows can all be attracted by the houses particularly adapted to their needs. The purple martin usually arrives in the Central States about the end of April. Martins, as you may know. travel and live in great colonies, sometimes as many as 100 birds living in one house. This is one of the most sociable and delightful American birds because you can win so many of them to live together, and then they are really the most valuable bird we have as they get their food, which consists mostly of mosquitoes, entirely out of the air. The experience of a Chicago bird lover is interesting and typical of many others in attracting purple martins. He was pressed for time and tossed a recently finished martin house upon the roof of a shed, intending to place the house upon a pole later on. That evening he returned to his house through an April storm of rain and sleet and was astonished to behold a flock of martins sitting on the telephone wires, apparently attracted by the new house which still lay upon the shed. Several passing teamsters noted the pitiable condition of the freezing birds and offered to raise the house for them. Tools were quickly brought and in a few minutes the united efforts of the kindly workmen had swung into place the heavy pole with its handsome bird-house on top. While the last brace was being spiked to the shed, the birds seeming to know that the house was for them, darted eagerly into the dripping shelter. They were quite fearless of the men on the roof of the shed and their twitterings of contentment could be distinctly heard. The house has been inhabited each year ever since, although it is right in the heart of the city now

and surrounded by large buildings and several huge smoke stacks.

Nearly all of my bird houses are of wood because I have found in long experience that the birds prefer this material. I have a martin and a wren house that have been up for 19 years and they are occupied every year and are in as good condition as when erected. The martin and bluebird houses should be erected on a pole, although I have won bluebirds by a hanging house as well as by one on a pole.

Here are a few general rules which should be observed when you make or set a bird house:

First: All bird houses should be at least a little weather-worn for all birds look with suspicion upon newness and abhor fresh paint. Yet the house should be well painted so it will last as after being once occupied the occupants will return to it every year and they will expect the same house and if anything should happen to the house or it were substituted by a new one you would lose your birds, sure.

Second: The house should be so placed that there will be as little danger as possible from that great enemy of all birds—the domestic cat.

Third: The openings in the houses should be of the following dimensions:

Martin houses,  $2 \times 2$  inches or  $2 \times 2\frac{1}{2}$  inches.

Wren houses, 15/16 ths of an inch.

Bluebird houses, 1½ inches.

Flicker houses, 23/4 inches.

Tree swallow house, 1¼ inches.

Fourth: Provide by all means, one bird bath in a sheltered place, preferably in some spot where you can have the great pleasure of watching the birds bathe and at the same time protect them from the danger of cats.

Fifth: Proper height for houses: The purple martin, which lives in great colonies numbering from 20 to 100, desire a house not less than 16 feet in the air. It can be higher but must not be lower. I have a house for martins which has 26 rooms and stands on a pole 16 feet high. There are more than 100 martins in this house every summer and the same birds come back to me year after year. I know this because I band a great deal of them. The proper height for the wren house, which should be hung from a tree or projection from some building, is about 10 to 12 feet. The proper height for a bluebird house, which should be placed on a pole, is 12 to 16 feet.

Don't imagine that because you live in the city or busy town that you cannot win native birds. There are birds near you and you will be surprised how readily they discover an attractive house so placed that they can with safety take it as their own and while I myself live in a suburb of Chicago, I am really in the city as my home is just over the line and as many as 1,500 autos an hour pass at certain times of the day. I have only one acre of ground, yet I have 54 bird houses, numerous shelters, food devices, baths, etc., in this garden and have from 300 to 500 native birds living on my property every summer. I have from 50 to 75 birds who stay with me all the year around. Birds do not freeze as many people suppose—they suffer and die from hunger. If they could get something to eat they could stand any cold in the winter, as their little hearts beat just twice as fast as ours. By providing them with shelter and food in protected food devices, I am enabled to keep them with me the year around.

I never have to spray or treat my fruit trees or plants. My birds take care of them for me.

# DEVELOPMENT WORK OF UTICA, N. Y. PARK SYSTEM.

The Utica Park Commission has been making earnest endeavors through initiating condemnation proceedings and otherwise to acquire land needed to complete the westerly link in the Utica Parkway now three and one half miles long. The last link is economically of vast importance to the city because it will connect the main thoroughfare of Utica, Genesee street, with the state roads and country to the southwest, cause the most beautiful hills around Utica to be built up, help keep taxrate down, through an increased valuation of property estimated to be—when parkway is completed—about 600 per cent. as as been the case with previous construction. A magnificent viaduct similar in appearance to the celebrated Luten Designs has already been erected in the westerly link across the railroads leaving Utica for the South and West.

The four new sanitary toilets constructed last year are ready to operate. They are solid concrete, with red asbestos shingles and brown trimmings. The ones in the parks are being concealed with mounds, trees and shrubs, giving, in effect, a semi-cave appearance.

The tennis courts are more popular than ever, as is the deer run. These animals, and the Opossums, Black Squirrels, wild rabbits and Pheasants are proving a source of great pleasure to the people.

The Park Commissioners hope to secure other deer, bears, racoons, and gold and silver pheasants as they

are able to construct enclosures for them.

Mr. Thomas R. Proctor, the public spirited citizen, who gave these large Utica parks to the city, has recently constructed a modern, up-to-date, exquisitely landscaped park, which he has named after his brother. This park is full of interesting, natural and formal features, is part hills, part valleys; full of streams, lakes, natural springs; contains swans, etc., a glorious pinetum and arboreal collection of hardwoods. Mr. Fred T. Proctor has just completed a most beautiful formal entrance on Rutger Boulevard using two ornamental columns of finest cut stone one each side of the entrance.

The Park Commission, a year ago, granted the use of a famous, old house, built chiefly from black walnut—now park property—to the boy scouts of which there are several flourishing troops here in Utica. The members of the Utica Park Commission are, F. E. Thomas, chairman; Tom W. Johnson, W. C. J. Doolittle, E. B. Townsend, secretary; E. M. Swiggett, superintendent of parks.

#### A UNIQUE PROPOSITION.

A new feature in future work will be the co-operation of the city parks with the Houston florists along a plan outlined by Park Superintendent C. L. Brock, who made an offer to the florists' club that all florists would be given bedding space in the parks where they could plant such stock as they desired, and the park gardeners would cultivate it for the additional beautification of the parks. The stock would remain the property of the florists who put it there, with the understading that in the fall they could take cuttings from the plants useful to them in propagaing during the winter in their greenhouses. It is understood several of the members of the clubs will avail themselves of this offer.—Exchange.

# Ornamental Fowl for Parks and Gardens

A MONTHLY TREATISE ON THEIR CULTURE.

#### BREEDING AND REARING PEACOCKS.

By John W. Talbot.

Peacocks were brought from the East Indies, where they are still found in vast flocks in a wild state. The head of the bird most familiar to us is adorned with a tuft of 24 feathers whose shafts are entirely bare, tipped with eyes of green and gold. In the male the head, throat, neck and breast are a deep blue, adorned with green and gold. The greater coverts and bastard wings are a reddish brown, as are also the quills, some of which are variegated with black and green. The belly and vent are black with a greenish hue. The distinguishing feature of this bird is its train which rises just above the tail, and when erected forms a fan of the most splendid hues. The two middle tufts are sometimes four and a half feet long and the others gradually diminish on either side, the shafts white and furnished from their origin nearly to the end with parted filaments of different colors, ending in a flat vane decorated with what are called The real tail consists of short, stiff, brown feathers which serve as a support to the train. When excited or in the presence of his female, the peacock erects his train and displays its beauty. All his movements are full of dignity: his head and neck bend nobly back, his pace is slow and solemn and he frequently turns slowly around as though to catch the sunlight on every side and show new colors of unequalled beauty, accompanied by a hollow murmuring sound expressive of desire. The cry of the peacock at other times is oft repeated and is very strident and disagreeable. The plumes are shed every year and while moulting the bird, as though humiliated, retires from view. In the female the neck is green and the top of the head is brown.

The rearing of peacocks requires the care of the gentle house holder. The bird wanders about safely without a keeper and when allowed proper range acquires for itself the greatest part of its nourishment. The females hatch, rear and feed their own young with very great care and success. The eggs of the peacock should not be hatched under other birds, nor should attempts be made to raise them except where the raising is done by the mother bird. Anyone raising or keeping peacocks should, by giving a signal at a certain time of day invariably call together the whole flock near the house and throw to them a little barley or pieces of bread or cake, corn bread or anything for which they develop a liking. The birds in time will become accustomed to this treat and will look forward to it and it will be found to keep them tame and kindly. They should never be driven or scared where it is not absolutely necessary, as this has a tendency to make them wild. In the breeding time the males sometimes become pugnacious and highly combative. One male may be mated with five pea hens. Their lodging places should be entirely free from moisture and the perches should be made movable so that they can be removed for the time when it is necessary to sweep and clean the building and floor. The males do not breed until fully matured and they do not mature until they are three years old. They may be fed anything that is good for chickens.

The young birds are a delightful table luxury. Many complain that the peacock is vicious and troublesome where kept with other poultry and that he often chases and kills young chickens and even the older hens, and

destroys eggs and eats them, but the writer's experience has been the contrary. We have never found that the peacocks annoyed the chickens, although kept with them constantly. In fact they were much kinder to the chickens than turkeys.

At the breeding season the pea hen seeks retired places for her nest and avoids as much as possible the intrusion of the male, who is apt to destroy the eggs and nest. She lays from five to seven eggs of a whitish color. Mr. Wilson had one pea hen that laid at one clutch as many as twelve, out of which he was so fortunate as to hatch seven chicks. The young are easily reared, especially on a dry fertile soil, where the pea hen can have the shelter and range of a shaw, hedgerow or wood, as well as pasture land. The pea chicks will thrive on the same kind of food as young turkeys. When well grown they should have a variety of grain, but about the breeding season more barley, which has a tendency to make them salacious and to increase the fertility of their eggs, as well as the number. The young keep with the old birds throughout the year, and are seldom driven off until the next breeding season. The peacock does not obtain his full adornments until the second year and is at his best in the fourth, fifth and sixth. It is said to be a very long lived bird, one hundred years a possible age, but, although I have made many inquiries, the limit so far has been from twenty to twenty-five years, and even that has lacked proof. The flesh of the old birds is dark, hard, harsh, dry and unless very fat almost tasteless, while that of the peahen at about twelve months is good and gamey, and the peachicks, when properly cooked and served, are exceedingly palatable. As they are by no means expensive or troublesome to rear, it is surprising that so few are kept for commercial purposes.

The feathers of the peacock are of some value. The quills of both cock and hen are still in demand for decorative purposes. The utmost cleanliness is necessary for these fowls, and fresh water must be given them at least once a day. If kept in confined runs they require green food daily, such as cabbage, lettuce, green oats and corn. Such weeds as cow parsley, etc., are good.

#### THE BIRDS OF BROOKLINE, MASS.

The town of Brookline, Mass., a suburb of Boston, has given the whole country a lesson in the value of birds. Its streets were lined with beautiful shade trees, but the moths and beetles were destroying them. Spraying the trees did no good. And then a man who knew what he was talking about, said:

"Let's bring the birds back; they'll attend to the worms and bugs."

He was allowed to have his way. The first thing he did was to have ordinances passed imposing severe penalties upon anyone who shot at or frightened a bird, and appointing a bird warden to enforce those laws. He put bird boxes in the trees, fed the birds regularly in winter and enticed them in other ways and the birds came, whole colonies and flocks of them. And the tree worms and beetles went.

A report just issued says: "Last year the town's sixty-five miles of streets showed no webs of the tent caterpillar and no signs of leopard moths, gypsy moths or beetles, though these insects were an abominable nuisance in nearly all sections outside."—Kansas City Star.

#### QUERIES and ANSWERS

We believe the greatest good can be accomplished for the greatest number, by instituting a query column; or an exchange of experiences, on practical propositions, by our readers.

You are invited to contribute questions, and answer others.

Each question as received will be given a number, the questioner's name will not be published, but the source of the answer will be given unless otherwise requested.

We all have something we would like to know more about. Here is your opportunity to ascertain somebody's experience in just that matter.

Nothing will tend to better fellowship than helping each other. Take advantage of this "Question Box."

While I find no difficulty in securing remedies to combat the many insects that infest our gardens, I have not, however, been able to learn what produces these insects and what, if anything, can be done to prevent their appearance. The black aphis appears to be our worst enemy this season. It has severely attacked an Euonymus bush which was transplanted this winter near some lilacs. The lilacs are not attacked and I do not recall having found any insects on this Euonymus before. Sedums are attacked by the black aphis while poppies, and columbines planted close by are free of them. We have had green aphis on some of our plants in past seasons, but this is the first year of the black aphis, while the green aphis seems absent. What explanation can you give me as to the cause of this invasion on some of our plants while others, usually subjected to insects, seem free of them so far this season.

It is only after a most fundamental study of the relation of the in-ect- and its enemies to the factors of climate that one would be in a position to answer the question which your correspondent asks. With a few exceptions no studies of insects have gone as far as this. No doubt the appearance and disappearance of almost any species of injurious insect which is followed closely enough year out and year in could be explained. In fact, I think that any entomological department with sufficient competent help might so scout the state that a knowledge of the status of all the principal injurious insects could be maintained and that the probability of an outbreak of this or that species could be forecasted with a reasonable degree of certainty, and that fairly adequate measures for its control could be taken in time. The maintenance of a scouting service of this sort would entail an expense which a State is not willing to bear, and we are therefore largely limited to the discovery and dissemination of measures of control. Your correspondent should be glad that efficient measures of control have been worked out for most of the injurious species. I am merely able to say that some condition in the aphis environment-natural enemies or unfavorable climate factors, or lack of food supply, or one or more of these factors operating together have caused the reduction of the green lice and favored the production of the black lice. ENTOMOLOGIST.

Will you please give me a few directions for the culture of sea kale in this country? . English directions do not seem to suit this climate. .I treat my plants very much like rhubarb in the spring but the stalks are thin, tough and somewhat bitter. The plants are three years old with the exception of about half a dozen which are no larger than the younger plants.

Sea kale is very easily grown if given a sunny position in the garden, and given well manured ground to grow in. The most satisfactory method of propagation is by means of root cuttings taken from forcing sized roots. These may be taken when forcing begins say in November and made: then stored in damp sand in the storage shed until spring, when they will be planted in the garden.

These soon start into growth and often make many growths. which must be thinned to the strongest one. If well grown these root cuttings may be forced the following year; and if a regular supply is made and planted each year, a good supply of forcing roots is maintained.

To grow sea kale from seed is a simple method, but takes one season longer to acquire forcing sized roots. Sea kale is as easily forced as Whitloof chicory, and may be treated in the same manner.

Place the roots around the edge of a deep flower pot, a few inches apart in leaf soil, with an inverted flower pot of the same size over, and place in a temperature of 65 degrees or 70 degrees. If the roots have been previously subjected to a freezing temperature they will respond very quickly.

Place the roots in heat every two weeks for succession.

T. E. R.

Can you let me know how to get rid of dandelions in lawns? They cannot be taken out by hand as the lawns are infested with too many of them. Do you think that we could get rid of them by plowing up the lawn, harrowing and raking it and then seeding down in September or would it be better to take a crop of buckwheat or something else before seeding down? T. K.

Before going to the radical cure of plowing up your lawn, is, it not possible to get rid of your dandelions by means of the poisoned dart. We used one of these instruments with great success. They are made by an English firm, but can be secured from Henderson's in New York, or other large dealers in garden sundries. The instrument is shaped like a long syringe, into which a weed killer is poured. The apex is sharp pointed, and when this point is pressed into the heart of the dandelion a portion of the liquid emerges and kills the plant. A large piece of ground can be gone over in a short time. Afterwards by scarifying the surface, brushing in fine rich soil, using care in watering and subsequent weeding, it might be possible to get the lawn reestablished. Otherwise plow up the ground in August, harrow it and get the roots killed by exposure to the sun and sow down in September. We do not see any benefit in sowing a buckwheat crop in this case. GARDENER.

I was quite interested in reading the criticism of William Gray in your April issue on my article entitled "Traditions of the Fathers." I wonder if Mr. Gray still takes soft wooded cuttings at the heel for such plants as are grown by the millions in the East for bedding plants annually. If he does he utterly failed in comprehending the teachings of Peter Henderson in his book "Growing Plants for Profit." I do not know of a single propagator of Verbenas, Heliotrope, Geranium, Fuchsias and other such plants, making a cutting at a joint for more than twenty years before I came to the State of California, and I have been on the Pacific Coast for eighteen years.

When we want to propagate geraniums here we cut up the whole plant, no matter how hard the wood. We put the cuttings in sand in a lath house, or a frame covered with lath to keep them damp, and they all root if the work is done from June 1 to Novem-

Fuchsias we grow from hard wood cuttings the same as willows are grown in the east. The same method is followed with Lemon Verbenas, Crepe Myrtle, Hydrangeas, etc., etc. Bougainvillesa are grown from old hard wood, from a half inch in diameter to two inches, and they all root, if placed in a glass house or a sash covered frame without bottom heat. To cut the heavy wood of Bougainvillesa a sharp saw is used.

Roses are grown here by the million every year from outdoor plants, never taking a cutting at a heel, and they get from 90 to 95 per cent. to strike. No better stock is grown anywhere.

P. D. BARNHART, Los Angeles, Cal.

#### Of Interest to Estate Owners

The National Association of Gardeners maintains a Service Bureau which is at the disposal of all who may require the services of efficient gardeners in their various capacities.

The association seeks the co-operation of estate owners in its efforts to secure opportunities for those engaged in the profession of gardening who are seeking to advance themselves. It makes no charge for services rendered. It endeavors to sup-ply men qualified to assume the responsibilities the position may call for.

Make your requirements known to

#### THE HORTICULTURAL SOCIETY OF NEW YORK SHOW.

The June exhibition of this society and of the American Rose Society was held, in co-operation with the New York Botanical Garden, in the Museum building of that institution, on the 5th and 6th. Owing to auspices of the Society of American Flor- the continued cold weather just before the ists and Ornamental Horticulturists, Phila- exhibition, peonies and roses were much retarded in their development. The display of these flowers was therefore relatively small. There was an excellent display of the flowers of shrubs and trees of herbaceous plants, including a large representation of irises. The display of flowers of shrubs and trees made by Mr. T. A. Navemeyer was of especial excellence, containing many unusual things. A large display was made by Messrs. Bobbink & Atkins, including a collection of irises, another of flowers of herbaceous plants, and also an excellent collection of rhododendron flowers. A group of plants, containing fine specimens of Pelargoniums, Calceolarias, Spiraeas, and Fuchsias, was exhibted by Mrs. F. A. Constable, and attracted much attention.

Following is a list of the awards: Collection of flowers, shrubs and trees: T.

A. Havemeyer, A. Lahodney, gardener, first; G. D. Barron, Jas. Linane, gardener, second.

Collection of flowers of herbaceous plants: Mrs. W. G. Nichols, Geo. N. Sullivan, gardener, first; Mrs. L. S. Chanler, E. Wilson, gardener, second.

Twenty-four vases cut orchids, open to all class: Lager & Hurrell, first; Clement Moore, J. P. Mossman, gardener, second.

Twelve vases cut orchids, non-commercial class: Mrs. Harold I. Pratt. A. J. Manda, gardener, first.

Three white peonies: T. A. Havemeyer, first. Three pink peonies: T. A Havemeyer,

first. Three rose peonies: T. A. Havemeyer,

first. Three crimson peonies: T. A. Havemeyer,

Collection of single peonies: T. A. Have-

Collection of peonies: T. A. Havemeyer,

Twelve vases hybrid tea roses, outdoor grown: Gen. E. A. McAlpin, J. Woodcock, gardener, first.

Vase hybrid tea roses, outdoor grown: Gen. E. A. McAlpin, first: Wm. Tricker. second.

The following special prizes were also awarded: Mrs. F. A. Constable, for a col-lection of flowers of herbaceous plants. eash: J. A. Manda, for new Swainsonia, Mrs. Jos. Manda, certificate of merit: Bobbink & Atkins, for collection of irises, silver

baceous plants, silver medal; for collection of rhododendron flowers, silver medal, for collection of flowers of shrubs and trees, special mention; Mrs. Marie Cullen, two vases roses, special mention; John Lewis Childs, for collection of irises of Germanica type, silver medal, for vase of Paeonia Mad. Coste, special mention; A. N. Pierson, Inc., for vases of roses in variety, silver medal; Wm. Shillaber, J. P. Sorenson, gardener, vase of sweet peas, special mention: Miss M. T. Cockcroft, Adam Paterson, gardener, vase of Spencer sweet peas, silver medal; Wm. Tricker, for collection of miscellaneous herbaceous plants, cash, for water lily, Mrs. Woodrow Wilson, certiwater My, Mis. Woodrow Wilson, Certificate of merit; Mrs. F. A. Constable, for group of plants of Pelargoniums, Calceolarias, Spiracas, and Fuchsias, cash; Wm. Ziegler, Jr., A. Bieschke, gardener, for sport of Dorothy Perkins, special mention.

The Bronze Medal of the American Rose Society was awarded to Gen. E. A. McAlpin for the best vase of hybrid tea roses, outdoor grown.

The judges were: A. J. Manda, Wm. Tricker and John Scheepers.

Mr. Robert Pyle, of West Grove, Pa., entertained an appreciative audience during the show with an illustrated lecture on "Rose Gardens for all the People." This was held in the lecture hall of the building and was well attended, it being estimated that there were nearly two hundred and fifty people in the audience. Mr. Pyle took the opportunity to urge the establishment of a public rose garden in New York City which should be in keeping with the great metropolis of this country.

GEORGE V. NASH, Secretary.

#### MENLO PARY (CAL.) HORTICULTURAL SOCIETY SHOW.

The first spring show that has been held under the auspices of the Menlo Park Horticultural Society took place here May 20. The show was only of one day's duration, but it proved to be a great success, in spite of the very inclement weather which has prevailed in this locality of late. The exhibits were large and varied, and it proved conclusively that the growers and private gardeners, and also the members of this society, can do things even if the weather conditions are not all that is to be desired. The display of Spencer sweet peas surpassed all expectations, and some grand stock was on view. Out-door roses also were shown in great variety, and proved to be a great attraction. The flowering shrub section was very excellent, considering growing conditions, as also were the displays of perennials and annuals.

The sweepstakes gold medal, awarded to the exhibitor winning the most first prizes, was awarded to the Lynch Nursery Company of Menlo Park, Cal. Special mention must be made of the grand new roses shown by George Nunn and the splendid exhibit of pot gloxinias by Joseph Paneicka, gardener to Mrs. Charles G. Lathrop. Paneicka's tuberous begonias, as well as his Spencer sweet peas, were very fine. John W. Daly, gardener to J. Lewy Nickel, showed a splendid lot of Burbank's new hybrid amaryllis; also, perennials and flowering shrubs. John Patterson's sweet peas showed splendid culture and the same can be said of his show of flowering shrubs.

David Bassett's roses in the collections carried off first honors, and it was an award well bestowed, as they were grand. The pansy display was a feature and the competition very keen. First honors went to Edward O'Neill, head gardener to the TalPlan for the Color-Glories of late Summer. Nature will supply the golden background for

# Shorburn's Seeds

PICTURE the rich crimsons, the fiery scarlets, the refreshing lavenders.

Whether you are planning color beauty for rockwork, sub-tropical garden, flower spray, shrubbery or background, we have the seeds for you.

Even if you are a very experienced gardener you will be surprised at the novelty and variety of seeds we have to aid you in carrying out the color pictures in your mind's eye.

We have a catalog for you too. Let us have your name so that we may send you a copy. Write

#### J. M. THORBURN & CO.

53U Barclay St., through to 54 Park Place NEW YORK

hibit. An award of merit was given to the Walker estate for a magnificent show of Silver Pink antirrhinum; these were very beautiful and splendidly grown. David W. Spalding, showed Slade, gardener to S. some of the finest digitalis ever seen in this locality. Henry Wright's exhibit of roses was greatly appreciated by the visitors.

Several awards were made for displays of wild flowers arranged by children, and there were quite a number of exhibits not entered for competition, chief among which was the carnations of Henry Goertzhain of Redwood City. Sidney Clock officiated as judge, and all his decisions were well re-

At the next monthly meeting of the society a smoker will be held and the society takes this means of inviting any member of the craft who should happen to be in this vicinity at that time. The date is June 10. As yet this society is undecided as to where the fall show will be held. As there is no hall of suitable size in Menlo Park it will probably be held in Palo Alto again this year. The members of this wideawake organization have long held the dream that some day the society would own its own building, but owing to various reasons that time has not arrived as yet. Arrangements will be made shortly for the annual outing, the one day that every member looks forward to with pleasure.—Ameri-

#### NEW LONDON HORTICULTURAL SOCIETY.

The regular monthly meeting of the New London Horticultural Society was held in its quarters in the Municipal building, State street, Thursday, June 10, a large number being present. In the absence of Mr. Martin C. Ebel, who was prevented by illness from fulfilling his engagement, Mr. Wallie Cook, of New York, gave a short talk on "Perennials, Their Season of Flowering. and Varieties Suitable for Amateurs to

Ernest Robinson, of the Plant estate, exhibited some nicely-grown Golden Glow Mums; also Carnations, Sweet Peas from outside were shown from the Harkens esthe noted wild garden of Mrs. Guthrie, "Meadow Court," John Maloney, gardener. A rising vote of thanks was given to Mr.

Cook for his talk.

A Rose show will be held in the Court House, Tuesday, June 22. This being the first attempt of the society in giving a Rose show, it is to be hoped the same will prove a success to it.

Owing to your correspondent being very busy last month, the report of the May meeting was omitted. Mr. Robinson, of the Plant estate, gave an address on exhibition Chrysanthemums at that meeting, a good number being present, followed by the usual STANLEY JORDAN. discussion.

### SHORT HILLS (N. J.) GARDEN CLUB

a number of types of new roses, were shown visitors pronounced the vegetables the best at the first annual spring flower exhibit of the Short Hills Garden Club, Short Hills, Gregor and Everitt acted as judges and N. J., on Wednesday, June 9. There were turned in the following list of awards: about twenty-five exhibits. It is planned to hold similar events annually. This, however, will not interfere with the annual fall, exhibit of dahlias held by the club.

The exhibit was considered exceptionally good when recent weather conditions are

bot C. Walker estate, for a magnificent ex- and Spanish. Mrs. John A. Stewart, Jr., exhibited German iris, which took up the space of a single table apart from the other exhibits. There was a variety of color, lavender, white, yellow and pink.

There was a large assortment of a new variety of roses. What was regarded by the women as the most beautiful, was a rose "Madam Herriott." in the exhibit of Mrs. Stephen Nash. Mrs. Nash's exhibit took up almost an entire table.

Two other types of rose exhibited by Mrs. Nash and which received much com-mendation were those named "Mrs. Aaron Ward" and "General Arthur.

Another rose praised was "Madam Pirrie," shown by Mrs. Frederick A. Burlingame. Mrs. Louis P. Bayard's roses, "Bell Seibrecht," "Prince of Bavaria," "Clara Wat-son" and "Edward Meyer," also proved attractive, as did that of Mrs. Frederick L. Rhodes, "Dean Hole."

Mrs. Edward B. Renwick and Mrs. Dean Emery exhibited large numbers of peonies. while the former also had on exhibition two lots of Oriental poppies that proved at-

tractive.

The older types of flowers were represented in the exhibit of Mrs. Edmund N. Todd, consisting of old French damask rose. Mrs. Charles H. Stout exhibited Spanish iris and laurel, while Mrs. Will Bradley had among her exhibit some carmine pillar roses and a quantity of peonies. Mrs. T. C. Satterthwaite exhibited peonies and other exhibits included quantities of laurel, columbine, and larkspur.

#### MORRIS COUNTY GARDENERS' AND FLORISTS' CLUB.

The regular monthly meeting was held on Wednesday evening. June 8, in Masonic Hall, Madison, N. J. In the absence of President Witing, Vice-president Robert Francis occupied the chair. It was decided to hold an out-door rose show on June 17. in Masonic Hall, to which the public is to be invited free, to be followed by a lecture on Roses, by Arthur Herrington.

The date of the Fall show was set as Oct. 28-29. Chas. H. Tutty, who recently returned from California, where he served as one of the international judges at tate; also a very fine display of Lupins from Panama-Pacific Exposition, entertained the members with an interesting talk on the interesting horticultural features of the exposition and California in general. He urged those in position to make the trip to take advantage of the exceptional opportunity to visit the western states at the moderate railway fares prevailing. eific Coast hospitality among horticulturists. he remarked, would not be found wanting.

#### OYSTER BAY HORTICULTURAL SOCIETY SHOW.

The Spring Show of the Oyster Bay Horticultural Society was held in Fireman's Hall, Oyster Bay, on June 11.

In quality of exhibits as well as quantity. this show surpassed all our other spring shows, although the weather has been un-SHOW. favorable. The cut-flower classes were well Early blooms of many varieties, including filled with excellent stock, and the many seen this year. Messrs, Johnston, Mac-

There were a number waiting admittance when the show was opened, and the attendance was unusually large all afternoon

and evening.

ANDREW R. KENNEDY, Secretary.

## CONNECTICUT HORTICULTURAL SOCIETY SHOW.

The society held its first spring flower show on Thursday and Friday, the 10th and 11th of this month, in lower Unity Hall, Hartford. The various exhibits were laid out to represent flower beds, some being oblong, others oval, crescent shaped, circles and half-circles. On each side of the entrance leading to the hall were box trees shown by W. W. Hunt & Co. The central exhibit was a towering mass of splendid palms and tropical plants surrounded by a border of maidenhair and other ferns. was staged by President Warren S. Mason, superintendent of the estate of A. A. Pope. Farmington, which was also represented by an attractive bed of perennials, blue lupinus, German and Spanish iris, salvia, phlox and Spanish roses. In passing from one exhibit to another the observer was delightfully charmed with the striking likeness to actual flower beds

W. W. Hunt & Co. had an oblong outline

## "The Typewriter of Perfect Presswork"

THE flawless presswork of the new Royal Master-Model 10 carries the high-grade business message in as fine form as your thoughts themselves! Royal presswork reinforces the result-getting power of your business-letters—for it adds the forceful stamp of quality to every letter you sign.

Heretofore, you have been obliged to accept a standard of typewriting inferior to high-class printing, yet you would not accept poor printing. But with the new standard of "typewriter presswork" created by the *new Royal* "10," it is no longer necessary to accept inferior typing in your office.

"The Type That Tells" Pick up the letters you have signed to-day. Examine them—then see a sample of the faultless presswork of the **Royal!** On which kind of typing will you send your signature to represent YOURSELF?

Which one will you trust to convey unmistakably to the world the character of your house?

## Get the Facts!

Send for the "Royal man" and ask for a DEMONSTRATION. Investigate the new master-machine that takes the "grind" out of type-writing. Or write us direct for our new brochure, "BETTER SERVICE," and book of facts on Touch-Typing-with a handsome Color-Photograph of the new ROYAL MODEL 10—all sent free to typewriter users. "Write now-right now!"

## ROYAL TYPEWRITER COMPANY, Inc. Royal Typewriter Bldg., Broadway, New York

composed of perennials, including blue and white lupins, various peonies, and the whole rising to a high centre of blue scabiosa. Single and double columbine, anchusa, campanula, buttercups, Jacob's ladder, phlox, and a superb group of Pennsylvania anesweet-william, Iceland poppies, lychins and hardy pinks.

John F. Huss, superintendent of the Goodwin estate, was another exhibitor of a wonderful variety of flowers, the centre of his bed being formed by the unusual yellowish blooms of isatis glaerca. Gorgeous Oriental poppies in red, pink and orange; German and Spanish iris, white and pink, alum root, fox gloves, anchusa, pink and blue lupins, red wiegela, petunias and sweet peas are among the other flowers in the group; and the same exhibitor made the stage a veritable bower with palms, flamingo flower. fancy leaved calladium and pink spirea, with especially interesting primroses never exhibited before, discovered in northern China by Professor Wilson, of Boston.

An effective round bed in which blue predominates was shown by Oscar F. Gritzmacher, of New Britain, anchusa, bachelor's buttons, peonies, double daisies, pansies. roses and Scotch pinks entering into it. A very beautiful round bed, composed of exquisite roses, was shown by Niel Nelson, also containing in the center pink and white enchantress carnations and sweet peas.

A. N. Pierson, of Cromwell, arranged a long bed of roses of all kinds, also displayed twenty-five blooms of each variety of roses grown in the Cromwell Gardens, which made a most charming spectacle. Four tables were decorated by John Coombs, Welch and Louis Chauvy, assisted by Miss Benson, to represent bridal tables. Each was a remarkable creation of beauty.

The design of this remarkable exhibit, which was the principal topic of discussion in Hartford the past week, was the creation of Mr. Walter A. Cooke, of the house of Stumpp & Walter Company, and the society takes this opportunity to thank the gentleman for his assistance in making our first spring show a grand success. The following are the awards and judges:

The judges of perennials were: Mrs. Samuel O. Prentice, Mrs. Morgan G. Bulkeley and Mrs. William H. Palmer. Those of the decorative tables and flowering plants were: Mrs. Frank C. Sumner, Miss Rose Johnson and Miss Virginia Browne. Following are the prize awards:

Perennials First, James J. Goodwin, second, W. W. Hunt & Co.; third, A. N. Pierson,

New York. Perhaps you know her. If you do, you very likely already know about the Happy Solution.

For those of you who don't, here's the story. It seems that she agreed to do all the "'tending garden," provided the man of the house would keep it watered

This he agreed to do, and then promptly began looking around for a way of entirely emancipating himself from "hose holding."

He finally successfully solved the problem by spending \$11.75 for one of our Rain Machines, and freed himself from all responsibility. His wife now turns on the tancet and the garden waters itself.

Doesn't this kind of emancipation appeal to you?

Send for booklet 614 fully describing the Skinner System Rain Machine

#### CONNECTICUT HORTICULTURAL SOCIETY.

At the meeting Friday evening was an exceedingly fine specimen of Campanula, Media layender, measuring more than three feet high and containing some 248 blooms. This plant created quite a sensation among the members by its beauty and splendid growth. This plant was grown by Alfred Cebelius, head gardener for Professor Jacobus, and received a first-class certificate. Mr. Cebelius also exhibited two varies ties of Lupinus polyphyllus, blue and rosea, and Emerus robustrum. John F Huss had a display of shrubs, among them being three varieties of duetzia, gracilis, Lemoinii and apple blossom, also dictamnus fraxinella, dictamnus alba and dictamnus rosea; viburnum tormentosum and spirea van Houttii. He was awarded a certificate of merit. Warren S. Mason, of Farming ton had the following: Anchusa Italica, Trollius Europa, Dicentia spectabilis, Hesperis matrionalis, Hemerocallis flava, hes peris, sweet rocket, armeria or thrift, Myosotis alpestris, Victoria rose, Alyssum Saxtile and others. He also received a certifi-cate of merit. Three new members were admitted to the society. The next meeting will be held in Unity Hall, Pratt street, on Wednesday evening, June 9, and all the members should make a special effort to be present in order that the Flower Show may meet with the highest success.

ALFRED DIXON, Secretary. Wethersfield, Conn., May 31, 1915.

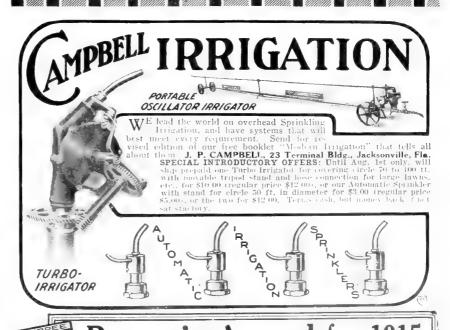

#### THE WESTCHESTER AND FAIRFIELD HORTICULTURAL SOCIETY.

There was a large and enthusiastic attendance at the regular monthly meeting of this society, held in their rooms in Doran's Hall, Greenwich, Conn., Friday evening, June 11, President Sealy presiding. Two new members were added to the lists and several proposals for membership were received and filed. The Summer Show Committee reported everything in readiness for the coming exhibition, to be held in the Town Hall, Greenwich, Conn., Friday and Saturday, June 18 and 19. Fifty-five classes are provided for. We anticipate a very fine exhibition of flowers, fruits and veg-We anticipate a very etables. The Outing Committee announced the date of the outing this year at Rye Beach Inn, August 11. The success of previous years will no doubt be repeated this year. The Fall Show Committee reported progress, and has ready for distribution a preliminary schedule. One hundred and eleven classes are included. Handsome prizes of cash, silver cups, medals, cut glass and useful silverware articles will be offered. Visitors were Mr. Joseph Manda, of South

Orange, N. J., and Mr. Watkins, of the Burnett Bros, seed house, New York City, who each addressed the meeting.

A special feature of this meeting was the grand display of cut flowers, plants and vegetables, staged by the following members, with the awards of the judges: Collection

Burpee's Annual tells the Plain Truth about Burpee-Quality Seeds. It is mailed free, Write for it today, - "Lest you forget." A postcard will do. W. ATLEE BURPEE & CO., Burpee Buildings, Philadelphia.

A tested Fungicide of practical value for Grapes, Roses, Cucumbers, Melons, Tomatoes and Pear Trees

Why Metropolitan Construction Was Used by the N. J. Agricultural Experiment Station, at New Brunswick, N. J.

HERE IS THE STORY: Every grower knows to what test the Government and State experiment stations put their greenhouses. The construction and heating system must be far above the ordinary in order to produce the desired results. The greenhouse on the extreme left was not built by us, but when a new one was wanted we were awarded the contract. This greenhouse (the one in the center) was constructed of the Metropolitan patented iron wall construction. Two years later they needed a third house, and would have none but our construction—that's the one to the right.

Here is what Dr. J. G. Lipman, Director of the New Jersey Agricultural Experiment Station, has to say about our work: "In so far as I know, the work done by you was eminently satisfactory, and I trust that we shall have occasion in the future to request your company to bid on other work."

If contemplating the building of a greenhouse, by we say mut plans and prices. We go anywhere in the U. S. J. HERE IS THE STORY: Every grower knows to what test the

Nothing adds more to the beauty and attractiveness of your grounds than a good, substantial fence. Permanency is of prime importance, too. Select the fence that defies rust and withstands all weather conditions.

fences are made of big, strong wires with clamped joints which prevent slipping, sagging or twisting. This exclusive feature assures unusual rigidity under the most severe strain. Excelsior Fences are dipped in molten zinc which makes them practically indestructible. Write for Catalog J from which to select the style best suited to your needs. Ask your hardware dealer for Excelsior "Rust Proof Trellises, Flower and Tree Guards.

WRIGHT WIRE COMPANY, Worcester, Mass.

Iron Fence Around the Grounds of the City Hospital

## What Happened at Cincinnati

NE of the things was, we secured the contract for that much talked about beautiful iron fence around the City Hospital

We now have some strikingly interesting photos of it. If you are considering an iron fence for your grounds we will gladly send you a collection of photos of this fence.

It's quite one of the best things we have done yet. Not so big as the Yellowstone Park order -as far as number of feet is concerned-but a fine piece of work in every way.

concentrated liquid

a concontrated liquid spinying material, readily soluble in water, is used at various strengths, me ording to directions on cans.

Aphine is equally effective in the house and garden; free from disagreeable odors of most insecticides, and practical for professional and amateur growers.

It is effective against green, black and white ross cabbage and curcking insects. It can be

thy, red spider, thrips, mealy bug, soft scale rose cabbage and white rant slugs, and other soft bodied and sap-sucking insects. It can be applied to the tenderest foliage, flowers, fruits and vegetables.

Aphine will keep your plants (sweet pea vines, rose bushes, etc., etc.) in the garden free from insects.

Gill, 25c.; half pint, 40c.; pint, 65c.; quart, \$1.00; gallon, \$2.50.

As a summer spray for hardy trees, shrubs and plants it is an effective remedy against green, black and white fly, red spider, thrips, woolly aphis, cottony maple scale, tulip scale, mealy bug, and all soft scale. Use one part Scaline to forty to fifty parts water.

Scaline will tid your evergreens and shrubs of the red spider pest, which has done so much havon to them recently.

For summer spraying, Scaline is recognized as a marked improvement over the old-fashioned kerosene emulsion; more effective and more economical. It mives readily with water, contains no sediment, and can be applied with the finest spray nozzle.

Quart, 75c.; gallon, \$1.50; 10 gallons, \$10.00.

is a concentrated sulphur composition, used as a spraying material, readily soluble in water, containing no sediment, and, unlike Bordeaux mixture, and lime and sulphur, does not stain the foliage, but cleanses it.

It is an infallible remedy for mildew, rust and wilt, affecting flowers, fruits and vegetables, and is used with much success by leading growers on young stock as a preventive against various blights. One gallon makes 50 gallons spraying material.

Half pint, 30c.; pint, 50c.; quart, 75c.; gallon, \$2.00.

is a soil sterilizer and vermicide. Destroys cut, wire, eel and grab worms, maggets, root lice and ants. Used one part to four hundred parts water, thoroughly soaking the ground, it will protect your plants and lawns against ravages under the soil.

Gill, 25c.; half pint, 40c.; pints, 65c.; quart, \$1.00; gallon, \$3.00.

These products have the endersement of leading a numerical and pricate grovers, and are generally recognized as standard remedies for the control of the insects and plant diseases for which they are recommended.

For sale by the leading seedsmen throughout the country. If not obtainable in your community, send us your order direct and we will have it shipped to you from our nearest agency.

# Rock Gardens and Rockeries

By Arthur Smith, Pennsylvania.

Slowly perhaps, but none the less surely, gardening with hardy plants is becoming the rule, to the exclusion of the unnatural, and therefore inartistic, beddingout system. That the latter has existed so long is due in a great measure to the fact that professional gardeners with expert knowledge of hardy plants are in the minority, and also because so many landscape architects, so called, rarely make provision for hardy

plants, other than shrubs, in their plans, as their knowledge of them is generally even less than that of the average gardener.

When people begin to see the artistic results produced by gardening with hardy plants, the effects of the ever-changing variety for the greater part of the year and the boundless possibilities connected with the system, they desire to bring into their gardens some

PORTION OF ROCK GARDEN, ADJOINING THE CONSERVATORY, U. S. BOTANIC GARDEN, WASHINGTON, D. C. GEORGE W. HESS, SUPERINTENDENT. THE ACACLA HUNDRISSUNA (HARDY ACACLA STEN IN THE BACKGROUND WAS PLANTED BY GENERAL U. S. GRANT.

of the many beautiful plants which find a congenial home among rocks. Hence a rockery is made with the idea of accommodating them.

We have used the caption "Rock Gardens and Rockeries"; the former may be of any extent, a distinct garden—in the same way that one would form a rose garden, for instance—in which one can create all kinds of situations suited to the needs of rock plants which distinctly differ in different species, whether from arid Arizona or from the mountains above the tree line close to perpetual snow. A rockery may cover only a few square yards devoted to a small collection of those choice gems of the floral world known as Alpines.

Whatever the extent of "rockwork" we propose to undertake, the underlying principles of construction ful subjects which are to be found upon the mountains we must give them a home which reproduces to the greatest possible extent that from which they are removed, and at the same time protect them from the adverse effects which may arise from the great difference in climate.

The mistake is often made of thinking that these plants grow upon rocks: it is true that a mere passing glance might lead one to suppose such to be the case, but if closely examined it will be found that their roots go down into the fissures of the rocks and in cases where these fissures have been opened up the roots have been found to be many feet in length and are thus safe from cold and drought.

This apparent prevailing idea that rock plants grow

ROCK GARDEN ON THE ESTATE OF THE LATE J. J. GOODWIN, HARTFORD, CONN. J. J. HUSS, SUPERINTENDENT. SHOWING AN ARTISTIC ARRANGEMENT OF ALPINE PLANTS. THE HARMONY OF COLOR IS INDESCRIBABLE.

are the same. There are few matters connected with horticulture wherein there have been more failures and ridiculous results than in the formation of rockeries.

The use of rocks in connection with growing plants is to create conditions similar to their native habitat and also to counteract the adverse circumstances brought about by a distinct change in that habitat. One of the principles of naturalizing is to produce as far as possible the environment in which the plant has been in the habit of living. The fact that a plant has been growing under certain conditions for a thousand or more years and is found in no other, is *prima facic* evidence that those conditions are best for its constitution. Therefore, if we wish to grow the many beauti-

upon rocks and therefore they require little or no soil, no doubt accounts for the method frequently employed in making rockeries, which is to dump a few loads of rocks on the top of hard ground, form them into a sort of pyramid, poke a few spoonfuls of soil between each, and ram in the plant with a stick. There are, it is true, a few species, such as Sedum acre, Sempervirum tectorum, that will survive this treatment, but one does not go to the trouble and expense of constructing a rockery for the purpose of growing subjects like these which will thrive in any poor, droughty situation.

The first point to be considered in making a rockery is the site. This should not be near trees or shrubs with extensive root action on account of their

roots being sure to find their way into the soil of the rockery and rob the plants of food and water. The drip from trees is also detrimental to the alpine section of rock plants. It should be in an open situation, not near the walls of a building and not join or be part of a closely-cut lawn or other formal environment. If possible it should be so placed that it is not seen until actually reached; in other words, it is better not to make it part of the landscape. The more airy the spot chosen the better, especially for alpines, and its surroundings should be as naturally picturesque as possible. In its immediate neighborhood dwarf subjects having compact roots may be used, such as the prostrate Junipers, dwarf species of native Rhododendrons, Andromedas, Heather and such like, with things of a taller nature farther away. Of

trouble and expense, but in all cases the site must be thoroughly cleared of everything likely to grow through and cause trouble in the future.

It is not necessary that a rock garden should be made into mounds and miniature mountains. A slight elevation above the immediate surroundings is not out of place; in fact, desirable, but a pile of earth and rocks, with a flat surface extending all round is unnatural and therefore inartistic.

If the ground of the site decided upon contains much clay it should be entirely removed and the drainage secured by tiles. Above the latter should be placed a few inches of stones, arranging so that the top of the stones is 3 feet below the surface of the soil in which the plants are to be placed.

The soil in which the plants are to grow should be

THE CAMERA DOES NOT DO FULL JUSTICE TO THIS SCENE. IT CANNOT REVEAL THE TRUE SPITNDOR OF THE TOTAGE AND BLOOM. ANOTHER VIEW OF THE ROCK GARDEN ON THE LATE, J. J. GOODWAY ESTATE.

course one has to make the best of the conditions they have, but jarring notes must be avoided, and simplicity and naturalness, which are too often lost sight of in general landscape work, made the guiding principles.

The drainage of the site must be absolutely perfect, as stagnant moisture is fatal; even when rock plants are found in nature growing among rocks in moist situations or where there is apparent constant drip from rocks above them, it will be found that there is complete drainage and that the drip is only there during the short summer, which in alpine regions is not more than three months, and there is no drip at all during the rest of the year because everything is frozen up and the plants under a mantle of dry snow. Upon some estates naturally rocky positions exist which can be adapted with comparatively little

such as to easily drain itself and at the same time hold plenty of moisture. To the uninitiated this may seem a paradoxical statement. Drainage is for the purpose of preventing the existence of stagnant, unabsorbed moisture, and a well-drained soil will absorb more moisture than an undrained one. A sponge, for example, holds a large quantity of water, but absorbs practically none. A properly drained and constituted soil absorbs much water, but holds none in a free state.

A depth of three feet of soil is not too great for rock plants, and it cannot be too rich. It should contain plenty of humus in the form of leaf mold one-fourth; old cow manure, spent hop or mushroom bed, one-fourth; another fourth good fibrous sod that has been piled for at least two years and turned five or six times during that period; the remainder sharp grit,

not fine sand altogether, but a mixture of sand and stones, the latter up to the size of turkey eggs. Briefly, humus and grit expresses the fundamental requirements of rock plants, particularly alpines.

As regards the kind of rock to use, that natural to the district and nearest at hand is the best on economical grounds, provided it does not crumble to pieces on being exposed to the weather. Rocks which have been exposed to the weather and have lichens or moss growing upon them are to be preferred; freshly quarried rock should not be used if any other is available. The use of pieces of concrete, brick, broken columns or any kind of artificial stone should not even be thought of.

There is nothing in mountainous districts where alpine conditions prevail so likely to mislead as the arrangement, or want of arrangement of the rocks. Some of the ugliest and most desolate rock gardens are the result of attempts to imitate the savage chaos of alpine boulders, which is supposed to be favorable to plant life because some alpines, difficult to grow under artificial conditions, are to be found thriving among them at an elevation of 9,000 or more feet. Now we in our gardens can provide an absurd and insignificant imitation of this chaos, but we cannot provide the elevation with the pure mountain air, the sustained winter frost and constant snow mantle, and the continuous summer moisture. The strewing a few boulders about at random will enable a few Stone Crops to flourish among them, but most other plants worth while going to any trouble for will take the first opportunity of dying; and an imitation chaos devoid of vegetation is, in a garden, scarcely less ugly than a rubbish heap.

In studying the rockwork of nature we must know the actual function rocks ought to perform in a garden. If this is borne in mind one can get many valuable hints from alpine districts, both practical and aesthetic. The first of these is that all rocks should be so placed that the roots of plants near them will be able to run under them, and so get protection from drought in summer and from cold and wet in the winter. Some ambitious rock gardens may be seen with the rocks driven perpendicularly down into the earth, in which position they are practically useless. Those who have been in alpine districts will have noticed that the finest specimens of alpine plants are to be found often in conditions not otherwise favorable, but at the edge of a great boulder which slants into the ground, so that their roots can run under it and get coolness and shelter as far as they are likely to penetrate; and it is in the slanting fissures of huge rocks that many of the more difficult plants grow best and most abundantly. Therefore, we should never place a rock without thinking of the plant that is to profit by it, nor should we consider rocks apart from roots, for the sole function of rocks in a rock garden is to protect roots and not to look rugged or picturesque.

Another point is to have the rocks as large as possible so that they may be sunk a good distance into the soil and give continuous protection to deep rooting plants. In making the rockery it is better to build up soil and rocks together, not to place all the soil into position and then place the rocks after. The tops of the rocks should not be very much above the soil, only just sufficient to form pockets; in fact, if they are level with the surface when the rockery is made, the natural sinking of the soil will give them about the right position, for in viewing a rock garden the eye should be filled by plants, not rocks.

There are many alpine plants which grow without rocks at all and thickly carpet the bottoms of valleys among the mountains, forming actual lawns of flowers; but when these plants are brought down into our gardens they invariably need to have their roots protected by rocks.

One reason why the formation of pockets is advantageous is because we can make such additions to the soil in a pocket necessary to suit special requirements of individual species. Some, for instance, prefer a soil containing lime, like the Milkworts and Bee Orchis. One does not usually associate any of the Rhododendron family with lime, but *R. chamaecestus*, a delightful species native of the mountains of Europe, likes it. Another alpine Rhododendron, *lapponicum*, is found upon the New England mountains, but the writer is unaware whether it prefers a soil containing lime or not. Then *Eriogonum*, native of the Rockies, not only likes lime, but also a soil composed of half grit. When lime is added it should be in the form of old broken lime mortar, or broken, not ground, lime rock; burnt or slaked lime should never be used.

(To be continued.)
(Editor's Note.—In the August number Mr. Smith will explain the best planting methods, varieties of alpines best suited to our climate, and the pleasure of gathering a collection of the plants.)

## ROCK GARDEN BUILT BY J. J. HUSS.

The situation of the layout, forming a valley, was naturally quite suggestive of the establishment of a Rock or Alpine garden, the straight walk leading to the sunken garden and connecting also with the extensive fern garden, writes J. F. Huss, in describing the beautiful rock garden he planned and developed on the late J. J. Goodwin estate, Hartford, Conn., and of which we present some views in these columns.

"There may be a great many diversities, tastes or opinions as to Alpine gardens, but as for myself," he writes, "where the aerial position is not extended to an extent where every plant is not in view of, or before us, large tall growing plants would not harmonize with the surroundings." His idea is only to use plants that will not exceed twelve inches as the tallest plants, just as we find them in the Alps, and mingled with low and creeping varieties which will cover some of the rocks, as you will observe in the illustrations. The most beautiful effect of this Alpine flora is attained during the months of May and June. The following collections are those contained in his garden which have given superb satisfaction, especially this season, being an unusual cool one, which seems to have been beneficial, as found in the Alps.

The many varieties of Primulas, Auriculas in many beautiful colors; Polyanthus with all the colors of the rainbow, with Sibbaldia, Veitchi, and others planted in semi-shaded positions, among which are the many varieties of Phlox subulatas, with the three divaricatas, as seen on the left of the illustration, together with Aubrietias and Arabis and rosea, with various Cerasciums and Erysum hanging over the rocks on each side of the paths. Alyssum Saxatile and flora plena of beautiful golden color. Further along we find the following varieties: Betonica rosea, Lychnis splendens fl. pl., Lychnis alpina, Draba olympica, Anemone alpina, Alchemilla splendens, Alsine, Gentiana acaulis. Gentiana Andrewsii, Helianthemum single and flora plena, Dianthus, dwarf Iris, Veronica, Arenaria montana, Campanula in many varieties, Primula, Geraniums, Ajuga, Daphne, Alchemilla, Potentilla, Soldanella alpina, Saxifraga and Sedums in many varieties, Silene, Leontodon in several varieties, with many others too numerous to mention.

## The Question of the Gardener

By Mrs. Francis King, Michigan.

A book on gardening in its varying aspects could hardly omit mention of that man who must be constantly in sight of those who garden, the gardener. the paid, the earnest, the almost always the friendly, assistant in our labors with flowers. That charming anonymous book, which appeared first in the form of letters to the Times (London), "Studies in Gardening." has a chapter, and a capital one, which I would commend, and it is called "Behavior to Gardeners." The few paragraphs I shall commit to paper on the subject will deal partly with this matter, the employer's attitude, and partly with the question of salary or wages; in the latter case taking the gardener's own standpoint.

It has often gone to my heart as a worker among flowers to see the misunderstandings which all too frequently arise between an American and his gardener. And so often this is entirely due to the difference in temperament. The average gardener, slow, careful, methodical, cannot but feel the heckling comments of his employer who wants things done in his way; yet who, in nine cases out of ten, does not know what that way is. The gardener must recognize and resent ignorance, haste, prejudice, and excessive criticism, and particularly is this hard to bear because as a rule the gardener loves his work, cherishes his plants, and, to his credit be it said, does this more faithfully and thoroughly than the untrained gardener for whom he labors.

To take up the other side, for the employer it should be set down that he may himself be a good amateur gardener, coupling to this an imaginative ingenuity which I like to think a characteristic of Americans; and the lack of imagination, the dumb devotion to traditional methods of gardening whose outward and visible signs he cannot but observe on each visit to his garden, go hard with him. It has been my lot to see in several cases employer and gardener antagonistic, and the best interest of an estate languishing under such conditions. One must be friends with one's gardener. I venture to assert that no great degree of success can be reached with flowers unless such is the happy case. Take note of a man's personality, of his temperament, when next you have occasion to decide upon the vital figure for your garden. If the candidate be not "simpatico," know that your garden cannot with him be carried happily, successfully along.

That was a refreshing instance of friendship between master and man shown in an anecdote of the great London flower exhibition, the Chelsea Show of May, 1912, and pleasant it is to repeat it here: "What a true aristocrat is, was forcibly illustrated the other day by an incident concerning the speech of Sir George Holford, who won the King's prize for orchids at the London show, and who, at the Royal Horticultural Society's dinner later, deprecated the great praise given him, saying that his friend Mr. Alexander deserved most of the credit. Mr. Farquhar met him the next day and complimented him on that portion of his speech. Sir George said: 'He is my friend; I never think of him otherwise.' The point of this illustration lies in the fact that Mr. Alexander is the baron's gar-

\*Extracts from the chapter on "The Gardener," from Mrs. Francis King's new book, "The Well Considered Garden." Published in these columns by permission of the author and her publishers, Charles Scribner's Sons, New York.

dener; but the baron never thought of referring to that fact in his speech. He spoke of him as his friend."

This, more remarkable where class distinctions are rigorously observed, has timely bearing upon the relations of master and man in our country, too. But here consideration and respect are not always lacking. . . .

Gardeners, according to classification given me by an expert, should be divided into their several grades as follows: 1. Gardener-superintendent. 2. Head gardener. 3. Working gardener. 4. Coachman gardener. Whose respective duties are:

1. Has charge of the whole estate and with foremen and assistants over the different departments of

greenhouses, gardens, farm, and so on.

2. Has charge of greenhouses and gardens only, with foremen and assistants, does no physical work.

3. Does most of the work himself with laborers and takes care of greenhouse, kitchen garden, and

4. Coachman first, gardener at odd times.

While the immigration laws of the United States classify the gardener as a personal body-servant, and his admission to this country is free from restrictions, in England he is not looked upon as such. He is the gardener in all senses of the word, and in no wellregulated establishment would the employer take the libery of gathering flowers, fruit, or vegetables without the consent of the gardener. Unfortunately, in the United States the majority of gardeners are looked upon as inferior to the chauffeur and the cook.

The American gardener, or rather the gardener emploved on some American estates, is the superintendent of the whole, including the farm and dwelling or mansion; his salary in a few cases being equal to three thousand dollars per year, with many privileges.

From the same authority to whom I am indebted for the classification of the gardener comes also the

following opinion, which I quote verbatim:

"We are unfortunate in this country, not having botanic gardens and gardens carried on like the Royal Horticultural Society in England, where the young gardener is taught the thorough, practical work of the gardener and goes through all departments, even to the menial work of digging, attending to furnaces, etc. In England the gardener has to pay an apprenticeship to the head gardener on some estates. After he has served an apprenticeship to the head, he becomes an assistant, then journeyman, then foreman. So he must have at least ten or fifteen years of thorough experience before he becomes head gardener. The trouble with the American gardener is that he is a specialist either in roses, carnations, or orchid growing, and has not the all-around knowledge of the European trained

"You cannot get an assistant gardener in this country to-day for much less than fifty-five dollars to sixty dollars per month and board. I mean an assistant in a large garden where they specialize in fruit-trees, rose-growing, carnations, orchids, palms and foliage

plants, and kitchen garden.

"This, you see, is far better than some wages paid to head gardeners. I do not think the average wages paid to a gardener in this country would be equal to one hundred dollars per month. In many instances this is the fault of the gardener himself. Most places that I know of are where gardeners have made themselves valuable and created the place. I have in mind at least two instances where gardeners were employed at sixty dollars per month and are now getting as high as one hundred and fifty dollars per month; this all happening inside of five years.'

The question of the gardener's worth in money is surely to be considered as an important one to both sides. A discussion of this matter has lately taken place with a rather unusual freedom of speech in the columns of one of our best horticultural weeklies; and it may be of interest to quote here from some of these arguments. One writer, taking the words of a former Secretary of the Treasury of the United States, begins thus: "In every profession which uses a man's highest powers and lays rigid demand on his idealism and courage it is always sage to assume that up to a certain point these men can be overworked and underpaid, because they are much more concerned with doing their work well than with being well paid for it. But when this imposition begins to reduce them and their families to poverty, they do not, as do workmen lower in the scale, go on strikes. They quietly resign and seek some other occupation. It is commonplace among professions in which idealism plays a part: this idealism is deliberately exploited to the disadvantage of those of whom it is exacted." This, I think, meets the gardener's case exactly, and, so long as conditions are as they are, gardening must necessarily be a labor

Now hear another, this time on the practical side: "The burning question seems to be how to get away from the fifty-dollars-a-month salary limit. There is no getting away from it so long as people of wealth are willing to hire a laborer who calls himself a gardener, at that price. The remedy, to my mind, is to start a campaign of education among the people who are wealthy enough to hire a real gardener and show them by facts, figures, and statistics that they are losing money by not doing so. A good gardener is worth anywhere from one hundred dollars up-just by the same process of reasoning that one would employ in

engaging a lawyer or doctor.

"The larger the estate, the more the responsibility. The larger the responsibility, the higher the salary. If a good man is squeezed down to taking less than he is worth, the greater the temptation to make something on the side. If a poor man, that is, an ignorant man willing to take laborer's wages, is hired, then the estate will suffer not only in that, but in many other ways. So that it is the employing class that the campaign of education should be aimed at. It will do no good to scold the seedsman or other allied interests; nor to split the ceiling in gardeners' meetings about the villainy of those fifty-dollar fellows calling themselves gardeners. One hundred dollars should be the the minimum. More should not be considered anything out of the way if the training, experience and native ability be present. But the employers have to be educated up to that." Proportions should be maintained, salaries of the learned professions kept in mind. I personally believe that \$100 a month is the least that should be offered by those whose fortune fits them to employ an excellent professional gardener.

In all these words, the subject of the gardener, his salary and his position, has been only begun. It is a matter which, with the ever-increasing interest in gardens, must and will be more and more discussed; and in which the gardener's side must be better looked after by his employer than at present seems to be the case. "And if the reply of an alarmed employer might be that all this means higher wages, our reply is, first,

that after all it is very little; and secondly, that the garden must be looked at in a new perspective, not as a tiresome and costly appurtenance every penny spent upon which is begrudged, while thousands are to be lavished on pictures, old china and motor cars, but as a great influence on life.

There is reasoning here as cogent as it is vigorous; I fully agree with this writer, and the more so when I think of the disproportionate use of money by those who would keep down the wages of the men engaged for their gardens; for those labors which go to produce what is becoming daily more and more precious to men and women in this age.

Let us who think seriously of these things not only learn to value the services of our own gardeners more fully, but let us spread our convictions upon the subject, and soon must come a better understanding and agreement between employer and employed.

## QUESTION OF PROPER PROPOGATION.

Editor, Gardeners' Chronicle.

Mr. Barnard is, as I can see, writing from the viewpoint of the plant factory and not from the private gardener's standpoint. Therefore, why did he take issue with the private gardener?

Gardeners still propagate in the old way to a great extent because they have found the results are

The gardener grows his plants on to maturity and the plantsman grows to sell in a young state. I am sure that I am not the only gardener that has been disappointed with stock purchased from the plant factory where every inch of wood is progagated to make a dollar. If it were surplus stock from a good many private places it would go in the dump. Mr. Barnard makes the statement that for twenty years before going west he did not know of any one making a cutting of a plant with a heel, mentioning Geraniums, Fuchsias, Heliotrope, Verbenas, etc., which shows he was not amongst the private gardeners to any extent, for they are still doing it today and no better stock is to be seen any place than on the private estates and I am sure by inquiry you will find that such stock cannot be duplicated by any of the establishments where plants are grown by the million. My contention was that Mr. Barnard's article was misleading in that it would give the reader the impression that his method of propagating gave better results and the gardener not following it was a fool and lacking in progress.

#### Newport, R. I. WILLIAM GRAY.

According to the Department of Agriculture ants do little injury to lawns and gardens and the injury that is attributed to them is usually caused by something else. In large numbers the small conical nests which they build on lawns are somewhat unsightly, and on this account it may be desirable in some cases

GARDEN ANTS DO LITTLE HARM.

Except for the unsightly appearance of their nests, however, the lawn ants do no appreciable harm. They are frequently noted on roses and on other ornamental and garden plants, and it is naturally supposed that they are doing harm to these. a matter of fact, it is not the plants that attract the ants, but plant lice. These tiny creatures excrete a sweet liquid of which ants are very fond, and which they collect without injuring the plant lice. On the whole, they do no harm of any kind except in so far as they lessen the attractive appearance of the lawn. On the other hand, it is quite possible that by bringing up from the lower depths sand and earth they may distinctly increase fertility by forming a top dressing or soil mulch, and at the same time permit better aeration of the earth.

# An Eighty Acre Estate in New York City

By The Onlooker.

Probably some who glance hurriedly through the pages of THE GARDINERS CHRONICLE may at first thought conclude that an error has been made in this headline. "An eighty acre estate in New York City? I hear someone inquire as he adds, "well, yes, but why should THE CHRONICLE branch out into real estate or building site problems?

In all seriousness, however, here we have one of the most trimly, attractive places and beautifully planted gardens it has been my privilege and pleasure to see and describe. It is the property of George W. Perkins, located at Riverdale, in New York City.

The place stands on high ground in an airy elevated location, everywhere abundantly timbered, and while there are spacious lawns and excellent vistas immediately around the house itself, one also finds that these are equally balanced by as much woodland environment through which one meanders under a canopy of leafy Linden trees, Elms, Beeches, Oaks and not a few Pines and Conifers. This wilderness feature is the salvation of such places as those of Mr. Perkins, for while the smaller type of suburban garden or property almost necessarily must be burnished and laid out

upon purely decorative lines in order to be comfortable, pleasant and fitting, a ten-acre or twenty-acre stretch of "Nature unadorned" supplies, in the fullest degree, all that one could get or expect in or on a country estate many miles further from Fifth avenue or Wall Street. Yet all of this woodland belt that stretches far down to the bosom of "the American Rhine" is not strictly unadorned—or not left unaided by the hand of man. This is just the place that Mr. Albert Millard, the superintendent who so faithfully and with much skill manages the estate, has seized upon for the naturalization of Daffodils, Tulips and other Holland bulbous stock.

The outstanding features from the gardener's standpoint are the very well-kept lawns and tall umbrageous trees, without which no garden has any dignity or measure. Secondly, and as the balancing factors in the layout, there is a handsome and solidlybuilt pergola, a high retaining wall, balustraded above the line of the lawns, together with a children's playhouse as an architectural addition forming a very useful, agreeable and satisfactory terminal to the terrace

A VIEW OF THE ROSE GARDEN ON THE COUNTRY ESTATE OF GEORGE W. PERKINS AT PIATROALE WITHIN THE CHARLOS TIMELS OF NEW YORK, WHERE ALBERT MILLARD PRESIDES AS SUPERINTENDENT

Thirdly, the adorning features of choice shrubbery groups and belts, remarkably well filled herbaceous borders, and on the crown of all, a highly natural-looking rock garden. Evidently the rock upon which New York City is built extends here, too, and stratified layers of it crop out in such a way as brings back to mind little prominences and cameos of true hill-land scenery. Who says that rock gardening in America may not be made a bright and interesting feature is truly behind the times—a man of pessimistical or foreshortened outlook. Why, here are sheets of the double and single-fringed Pinks which, even when

On the left or north side there is a hexagonal shaped Summer house, its base and sides built of stone, also the stone piers, but the roof was formed of cork bark. This gave a rustice effect and kept it well in harmony with the garden. Sempervirums, or House Leeks, were colonized here and there in niches of the bark.

From this collection of alpines a few steps takes one on to the lawns with the pergola marking the division between them and the rockery. This pergola forms a right angle, running first down then across. Each way it is about 100 feet in length, 9 feet high and 9 feet wide. The walls and pillars are of stone, the

THE PINE NILEAR WALK ON THE GLO W. PERKINS ISTATE AMONG THE RHODODENDRONS. MORE THAN FIFTEEN HUNDRED OF MANY VARIETIES ARE PLANTED HERF.

only their stems and leaves remain, are ornamental. There are also Sedums and House Leeks, Heucheras or Alum root, Poppies—the Peacock Poppy, the orange-colored pilosum and the Iceland varieties for later flowering, and such vigorous and desirable plants as Saponaria ocymoides, the Soapwort, Cerastium tomentosum, popularly called Snow-in-Summer; the gray-leaved, blue-flowered Veronica incana (Speedwell), the double white Arabis or Rock Cress, with its companion of the early spring, the yellow Allyssum saxatile fl. pl.

This rock garden occupied the crown of the highest ground and was perfectly open, although sufficiently sheltered in its outward surroundings by tall trees. It gently sloped on at least three of its sides.

roof of wood beams with scalloped ends abutting beyond the longitudinal supports. Here are Roses in variety, Wistaria, Lonicera Halleana, Vitises, and dwarfed subjects for the lower parts.

Upon the lawns parallel with the pergola were lines and groups of neat golden Privet, a shrub that is accessible to every one and ought to be far more liberally used for brightening up many a corner.

It is a pleasant outlook—the wooded slope across the water, the lawns, terraces, flower borders and big trees where we stand. These flower borders lie westward from the pergola and below it. They are thus in view from two sides. The outline is sinuous. Here are great golden colonies of Helianthus, Rudbeckia, Coreopsis; blue masses of tall Delphiniums, the light blue Belladonna

among them. Contrasting with these are the grouplets of Lilium candidum, the white Madonna Lily, Lychnis chalcedonica, with its fiery scarlet clusters; gorgeous Peonies, both here and by themselves in other beds nearby; frontal plantings of Antirrhinums, Verbenas, Sweet Williams and Godetias. These groupings were not promiscuous, but were massed in colors of one kind, thereby getting the best and fullest tone effects. Away behind, or in line with the Delphiniums stood rank upon rank of stately Hollyhocks, and here and there the bold, handsome foliage of the Plume Poppy (Bocconia cordata).

German and Japanese Irises colonized and flourishing in almost wild prodigality as an adjacent feature in this part of the garden, deserve notice. So do the beds of fine leaved Japanese Maples. The late flowering Ligustrum Ibota (white), reminded one of the display of the Persian Lilacs that had been in bloom some time earlier. Some of the recently introduced Nephrolepis ferns were planted at a corner where two paths diverge. This was under the shade of trees, and strongly flowered plants of the orange colored Primula Bulleyana were intermixed. Touches like this greatly interest the advanced student of gardens and flowers. Then not far away another bend of a border, this time in front of shrubs and just clear of the shade of the trees, was devoted to regal Pelargoniums—those beautiful plants that used to plague the life out of us in our English and French and German gardens when we so carefully grew them in pots in greenhouses. How easily they were overwatered and sickened and died; how prone they were to the attacks of aphides! And the drying off, and the pruning back and repotting. Yet here they were smothering themselves in bloom in the rudest of health and vigor, as if expressing satisfaction at being free from the trammels that man imposes.

Beside the play house already mentioned there is a large open-air swimming tank. A tennis court is another recreational provision, while as distinctive from the purely ornamental there are very compact fruit gardens of nearly an acre, comprising Raspberries, hardy Grapes, Blackberries, Strawberries and other things, all closed about with a tall wire netting screen; and an ample vegetable garden away down out of sight near the river.

The glass houses, too, yield Melous, Cucumbers and Tomatoes, although some of these are grown in unheated frames, and Roses, Carnations, Sweet Peas, Chrysanthemums, Gardenias, ferns and foliage plants

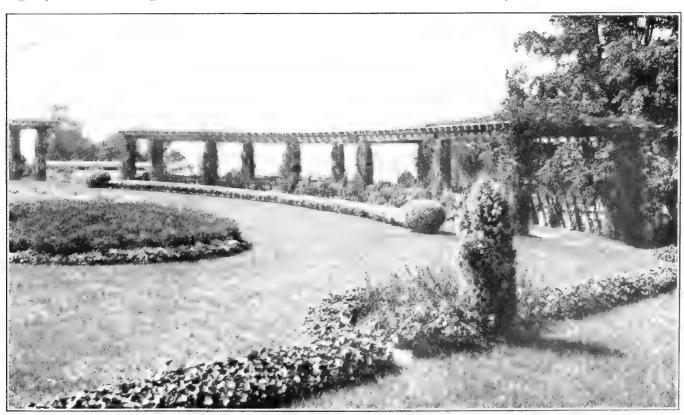

mainly fill the span-roofed greenhouses.

A Pine-needle path under Pine trees and Hemlocks skirts the outer grounds and around the fruit garden, the needles being brought from Pennsylvania woods annually so that the soft, carpet-like surface with its faintly resinous odor, remains fresh and clean always. The Pine-needle walk is hedged about with Rhododendrons, wild ferns (Aspidium), and here, too, has the Lily of the Valley become naturalized.

Lastly may be mentioned the formal Rose garden, a pretty geometrical rosary of long, rectangular beds on the grass, with other crescent shaped ones filling in the corners. Standard as well as bush Roses were here, the standards having their stems bound in hay bands to prevent sun scald. They were loaded with bloom—Druschki, Mrs. Laing, Ulrich Brunner and others. In the beds we see Rayon d'Or, the new golden yellow, flowering freely. General McArthur is a fine red, but the collection as a whole contained many of the finer hybrid perpetuals and hybrid teas.

One cannot but think that Mr. Perkins and family, together with their friends, must greatly enjoy the peace, quietude and refreshing storehouse of charm, beauty and interest of their wonderful estate—wonderful because so complete in its many features, because of its rus in urbe effect, and because of the gen-

eral excellence of its subjects.

FROM THIS TERRACE ONE LOOKS OUT BEYOND THE PERGOLV ON THE WORLD RENOWNED HEDSON RIVER. WHICH TOWS
PAST THE ESTATE.

# Garden Perennials That Thrive Under Neglect

By Stephen F. Hamblin, Massachusetts.

There is a great difference in the amount of attention that perennial herbs in the garden require for a fair amount of growth and a good bloom. I do not refer to common wild flowers that may be introduced near the house, for such will of course do very well when left to themselves, if planted in proper soil. But a great many plants, once brought from distant lands, or from other parts of our country, are so sturdy of growth and indifferent to soil conditions that they are permanent features of home grounds when once properly planted, even if grass is allowed to try to choke them, and fertilizer and cultivation are unknown.

I don't mean that they are used in "wild gardening" experiments, nor planted in "any old place" to shift for themselves, but started in garden soil and intended to give a garden effect. These are the ones that persist, but do not spread, in old gardens long after the garden builders, and the house that sheltered them, have moulded in dust. Many a grass-grown "old-fashioned garden" still has every year thrifty clumps of Creeping Phlox,

Feony, German Iris, Thread Lily, and others.

For several years I have been interested in an "oldfashioned garden" in Massachusetts where absolutely no care has been given to the plants for five years—not a weed has been pulled, not a plant removed, nor has the spade been used to loosen the soil or reset plants that have become crowded or starved. They have been left to fight their own way among each other. A heavy loam that bakes dry in summer and becomes soggy in winter makes the struggle for existence much harder.

Some of the plants have been in place at least ten years, and formerly they were cultivated after a fashion. but never enough for their best development. No two garden spots ever offer the same conditions for plant growth, but this list will be found fairly representative of results in other plantings. Though in this garden there are shady spots, due to the presence of large shrubs, these notes were taken on plants that had nearly full sun.

This list has little meaning when taken by itself, or as absolute test of what plants will do under crowded conditions, for many plants failed here that in other places will do very well. Even with the same piece of ground there would have been more survivals had there not been so many shrubs there. A good many native plants, not mentioned in the list as they would naturally be self-supporting, were planted in this garden, and their vigor has been at the expense of the garden-like sorts. The biennials mentioned are about as numerous as when planted some six years ago, but they are not in the places where planted, but push up among the lower herbs and between the shrubs. This shows their power of self sowing; in a more open garden they would have increased more.

The negative list of those that failed is the least valnable for another spot would give the plants different conditions. Those that failed this time to hold their own were low growers that were smothered, spreading herbs that crowded themselves and should have been divided, or free bloomers that exhaust themselves. They are all hardy and thrifty, but when under cultivation, not when

left to themselves utterly.

Those that stayed and bloom nearly as well this year as they did five years ago are to be particularly commended for their strong constitutions, for herbs that can survive the treatment they got in that place will never fail anyone under the ordinary conditions of any garden. They may be made the mainstay of any planting. The

list can be made longer, for only a part of the plants seen in gardens were tried here, though perhaps at the time of planting the preference was given to the species that have been favorites in gardens for at least a half century.

#### PLANTS THAT THRIVE AFTER FIVE YEARS' NEGLECT.

#### Tall Herbs.

Garden Lupine Lupinus polyphyllus blue, white, pink, Balloon-flower Platycodon graudiflorum—blue, white. German Iris - Iris germanica - various colors. Yellow flag - Iris pseudacorus - yellow. Plaited Flag – Iris plicata Mad. Chercau – pale bluc. Siberian Iris – Iris sibirica – bluc, white. Late Siberian Iris Iris sanguinea, and var. Snow Queen-blue, Lemon Daylily Hemerocallis flava yellow. Double Tawny Daylily—Hemercocallis fulya fl. pl.—orange.

Late Lemon Daylily Hemerocallis Thunbergii—yellow. Orange Daylily—Hemerocallis Dumortieri—orange. Tiger Lily—Lilium tigrinum orange. Yellow Japanese Lily Lilium Henryi yellow. Garden Peony-Paeonia albiflora-red to white. Solomon's seal Polygonatum multiflorum Gasplant Dictamnus albus pink and white Perennial Pea -Lathyrus latifolius-pink, white. Oriental Poppy Papaver orientale scarlet. Peachleaf Bellflower Campanula persicitolia Scarlet Lightning Lychm's chalcedonica scarlet. Garden Phlox Phlox paniculata various. New England Aster Aster nova-angliae purple, rose. Tickseed-Coreopsis lanceolta-yellow. Golden Glow-Rudbeckia laciniata fl. pl.-yellow. Oriental Larkspur—Delphinium formosum—blue. Meadow Sage Salvia pratensis blue. Spider Lily Tradescantia virginica—blue, white. White Snakeroot—Eupatorium articifolium white. Amsonia—Amsonia Tabernaemontana blue. Thread Lily Yucca filamentosa white.

#### Low Herbs.

Bloodroot—Sanguinaria canadensis—white Dutch Crocus Crocus vernus blue, white, Lily-of-the-valley-tonvallaria majalis-white. Star-of-Bethlehem Ornithogalum umbellatum white. Daffodil—Xarcissus Psuedo-Xarcissus Von Sion—yellow Poet's Narcissus Narcissus poeticus—white. Grape Hyacinth Muscari botryoides blue. Autumn Crocus—Crocus speciosus—blue. Rock Speedwell—Veronica rupestris—blue. Common Speedwell-Veronica officianalis-blue. Myrtle Vinca minor blue. Darwin Tulips Tulipa Gesneriana various. Creeping Thyme Thymus Scrpyllum pink. Silver-bell Stellaria Holostea Scotch Pink—Dianthus plumarius—pink, white. Showy Stonecrop—Sedun spectabile—pink. Creeping Phlox Phlox abulata pink, white Creeping Stonecrop-Sed m stoloniferum-pink. Yellow Stonecrop—Sedum Aizoon—yellow. Greek Valerian—Polemonium reptans -blue. Meadow Saffron-Colchicum autumnale-pink, white. Chinees Larkspur-Delphinium grandiflorum-blue, white, Crested Iris Iris cristata - blue. Dwarf Iris Iris pumila blue. White Plantain-lily—Hosta plantaginea—white. Lance-leaf Plantain-lily-Hosta lancifolia-blue. Sweet Violet Viola odorata-blue.

#### Biennials That Self-Sow.

Sweet Rocket-Hesperis matronalis-pink, purple, white Columbine - Aquilegia vulgaris - purple, white. Feverfew—Chrysanthemum Parthenium—white. Sweet William Dianthus barbatus—various. Orange Coneflower-Rudbeckia fulgida-orange.

#### Perennials Lost After Five Years of Neglect.

Japanese Iris -Iris Kaempferi. Perennial Flax Linum perenne. Persian Daisy—Chrysanthemum coccineum. Blanket-flower—Gaillardia aristata. White Boltonia—Boltonia asteroides

Pink Boltonia latisquama Sneezeweed Helenium autumnale. Bee-balm Monarda didyma. Hardy Chrysanthemum Chrysanthemum Lortorum. Musk Mallow Malya moschata. Hybrid Larkspur Delphinium hybridum. Japanese Lily Lilium speciosum. Late Monkshood Acoustum autumnale, Yellow Foxglove Digitalis grandiflora. Scarlet Beardtongue | Pentstemon barbatus Torreyi, Carpathian Harebell | Campanula carpatica. Tuffed Pansies Viola cornuta hybrids. Sea Thritt Armeria vulgaris. Carolina Phlox Phlox ovata. Silvery Chickweed Cerastium tomentosum. Mountain Cornflower Centaurea montana. Goldfutt Alyssum saxatile. Snow-in-summer Arabis albida. Perennial Candytuft—Iberis sempervirens. Pin-cushion-flower Scabiosa cancasica. Japanese Speedwell-Veronica longifolia subsessilis.

#### SCHIZANTHUS CULTURE.

By Staneby R. Candelr, New York.

Where greenhouse space is limited and a continual display of flowers is expected, one must always be on the lookout for flowering plants that are quickly raised, quickly grown and quickly brought into full flower; so one cannot overlook the Schizanthus as one of the best subjects for greenhouse and conservatory decoration, the cultivation of which is within the reach of all who possess a cool greenhouse.

The Schizanthus is sometimes called the "Butterfly Flower" after the shape of the flower; it belongs to the natural order of Solanaceae. The flowers, which are of the most varied and brilliant colors, are borne on terminal cymes (a cyme being the botanical term employed where the first axis of the inflorescence ends in a single flower and opens first); the corolla or throat is, as a rule, of the darkest color in each single

flower, thus giving a very fine effect.

The reason this plant is of such value is that it can be readily raised and it has wonderful decorative character, as it can be had in flower either in mid-winter or in early spring, just as the cultivator requires. Its usefulness does not end as a decorative plant, for as a cut flower it can be used with wonderful results, being of such a light and graceful habit that it is most valuable as a subject for dinner-table decorations. In fact, in its season it has no rival and for gracefulness it will surpass the delicate effect of the sweet peas when used for the above-mentioned purpose. It is the light branching habit of the Schizanthus which gives it such a graceful effect.

CULTIVATION.—The best season to sow the seed is in August. Some sow in July, but there is nothing gained by early sowing; that is, if the plants are required to flower in spring, which is the most popular season to

flower them.

Seeds should be sown very thinly in pans or boxes, taking good care that the soil is well drained; a light soil of poor nature is best for sowing purposes; never sow seeds in a highly-manured soil. These boxes should be placed in the coolest section of the greenhouse or in the cold frame to allow germination to take place. As soon as the seedlings are large enough to handle, pick them off into boxes or pans about 2 inches apart and employ a very light, well-drained soil in this case, placing them in a light, airy place, as light and air are most essential to the well being of this plant. As soon as the plants have become established and make enough growth it is advisable to pot them singly in 2½-inch or 3-inch pots (here employ a soil composed of loam and leaf soil, two parts of loam and

one of leaf soil, to which add a little grit). Once they begin to grow it is advisable to re-pot into larger pots according to growth of roots; but do not over-pot; only give a slightly larger pot each time. Do not pot to firm, as that is harmful to the young roots of this plant; also do not allow the plants to become potbound before re-potting (pot-bound means when the roots are formed into one hard ball within the pot). Always make sure the pots are well drained by employing a few pieces of broken pots as drainage and place a few semi-decayed leaves over this drainage; this will prevent small soil from working between the broken pots and thus making good drainage impossible. After each potting, water with great care; in fact, keep the plants on the dry side till a few roots have been made; otherwise over-watering at this stage would cause the soil to become sour.

Should the plants be inclined to flower early or make straggly growths, it is then advisable to pinch out the long shoots, thus giving the plants a bushy and compact habit. When the plants have been potted into the final pots and the pots become filled with roots, then they can be fed with liquid stable manure or farmyard manure; also a change of soot water could be given with great advantage at this season. Soot water is of great value to most all plants grown in pots, as it acts in two ways—first, as a stimulant: second, as a cleanser of the soil, as worms do not like

soot in any form.

At all times give plenty of ventilation, but do this with great judgment; otherwise bad ventilation will soon end in diseased stock. Avoid cross draughts and cold winds. It is very advisable to stalk the plants, and this should be done after the first or second potting, according to state of plant. Enlarged stalks should be placed at each potting; that is, always keep one centre stalk until the final potting and then the plants can be shaped out to the grower's requirements. Strong twine makes a very neat and safe support.

When purchasing Schizanthus seed it is always advisable to obtain same from some reliable seed house. as there are so many inferior strains on the market that unless you have a good start with seed from a good strong stock, you will have trouble all along

and results will be very disappointing.

The Schizanthus Wisetonensis hybrids are the best to grow and are most commonly employed; these are the results of continued selection and hybridization on the part of the horticulturist.

The Schizanthus are annual herbs from Chile, some

six species being known.

#### PROTECT YOUR TREES.

"Many of the fine remnants of former torest glory or of old time planting which adorn the grounds of our wealthy citizens and of our note humble home makers, go to passes gradually, unobserved and unnecessarily, because of neglect and carelessness; a little care at the proper time would have saved the investment which cannot  $\Gamma$  duplicated in the exercis literary  $\Gamma$  B, F, Fernow.

When trees are dormant there is much work that may be done to promote their growth and protect them against injury. A little attention at this period in the way of pruning and the destruction of fungi and the various insect pests will prove beneficial and save much time and labor later. In late fall or early spring is the proper time and land later. In late land of early spring is the proper time for planting all decidous varieties. The important work of tree surgery may also be carried on successfully during the winter time except in severe cold weather.

"Eternal vigilance" is the price of thrifty trees as well as of

liberty and many other blessings, and the enthusiastic tree owner knows neither times nor seasons in his watchful care. it is labor of leve, and one which repays a hundredfold. Tree Talk.

# Work for the Month of August

Conducted by Henry Gibson, New York.

THE PLOWER GARDEN.

Cleanliness is the order of the day in this department. Continue to remove spent flowers, as the plants will soon cease to bloom if seed pods are allowed to develop. Dahlias, hollyhocks and other tall-growing subjects must be secured to supports or they will fall

a prey to strong winds.

Roses of the rambler, or climbing types, are now making strong basal growths which will provide next year's show of blooms. These should be tied in whenever opportunity offers. The rapid growth of these plants indicates the activity of the roots, which should be kept regularly supplied with water. Old-established plants will be benefited by liberal applications of liquid manure.

#### SEEDLING PLANTS.

Numerous kinds of perennials and other seedlings will be ready to transfer to nursery beds this month. By planting them while they are quite small the danger of having long-stemmed, leggy plants is avoided. If they are left in the seed bed until they become drawn it will be necessary to plant them deeply in the nursery beds. This in itself is not a difficult matter, as they can be readily dibbled in, but when they have to be replanted to their permanent quarters a considerable amount of labor is involved with leggy plants.

#### THE VEGITABLE GARDEN.

Rhubarb should never be allowed to flower unless seed is wanted. As soon as the flower stalks appear they should be cut off close to the ground. Whenever there is room, late crops of beans, beets, turnips, radish, lettuce, etc., may be sown. Keep the tomatoes tied up and disbudded. Endive also requires tying up for bleaching. Continue to earth up early celery as it requires it. Onions should be harvested this month. A sowing of Grand Rapids lettuce for growing in frames or under glass can be made now. Late celery may still be planted. Care should be taken to keep the ground between the growing crops well cultivated. Many weeds mature this month and in doing so produce countless thousands of weed seeds, which are bound to cause trouble another season.

#### THE FRUIT GARDEN.

Strawberries may be set out this month. Set the plants firmly in the soil, and keep all the runners pinched off. The ground will need to be deeply dug or ploughed, after having had a liberal application of well-decayed manure applied. Two feet between the rows is not too much. Don't overlook a few plants for forcing.

Go over the vines to ascertain if the grapes are developing evenly. If there are signs of too many bunches being left to mature, don't hesitate to thin them out. Those left will be of much better quality.

The old canes of the raspberries and blackberries should be cut away and the young ones thinned out, taking care to leave the most vigorous canes. These may be headed back to about four feet in height, thus inducing them to produce laterals that will also bear fruit next season.

#### THE GREENHOUSES. (THE ROSES.)

The object of the rose grower at this time of the year should be to have the plants growing strong and healthy and so lay a good foundation for the winter.

August is a most trying month for roses; the hot, sultry days, combined with cold nights, are very conducive to an attack of mildew or black spot. Don't hesitate to even up the difference between day and night temperature with a little heat in the hot water pipes if necessary.

#### CARNATIONS,

The planting of field grown stock should be pushed ahead with all possible speed. Give the houses a little shade for a few days until the plants show signs of renewed root acton. A light coating of lime doesn't take long to apply, and it makes the actual planting a much more congenial task for the men who are doing it than would be the case working in an unshaded house.

Spraying two or three times a day, as conditions seem to warrant, will greatly assist the plants to recover themselves. If early blooms are wanted the leading shoots should not be pinched back.

#### CHRYSANTHEMUMS.

There is no end to the work among the Mums during the next few weeks. The plants are growing rapidly and must have adequate supports and be carefully tied up if straight stems are wanted. Disbudding takes up a good deal of time, and must be faithfully attended to in order to get the best results. After the middle of the month the buds of many of the midseason varieties can be taken. It takes from six to eight weeks for a bloom to come to maturity after the bud is taken, a fact that should not be overlooked when the operation is performed.

Once the buds are formed, moderate applications of fertilizers, or weak liquid manure, will be beneficial. Feeding chrysanthemums before the buds have formed is a much mooted question among growers, but as space forbids discussing this matter at length now, we will leave it over until next month.

#### \MARYLLIS.

These subjects are now making vigorous growth and if plunged in frames, much less work will be experienced in keeping them watered. The sashes should be raised, both top and bottom, all the time. Sufficient shade should be provided to prevent burning of the foliage.

Syringing frequently greatly accelerates the growth and also keeps the plants free from mealy bug and red spider. Liquid manure once a week now, and twice later on will assist greatly in making good strong bulbs by Fall.

#### CALLAS.

Callas that have had a rest during the past five or six weeks should now be started into growth. Such as show signs of a sturdy crown growth are good for another season. Shake them out and place into suitable sized pots. Three parts good loam and one of cow manure makes a very good compost for callas. Good drainage is essential. After potting they may be stood in a cold frame for the next month or so.

#### MISCELLANEOUS PLANTS.

Continue to pot poinsettias as they require it; also cyclamen, cineraria and primulas.

Seeds of cyclamen, cineraria, calceolaria, schizanthers, mignonette, sweet peas should be sown now.

# Ornamental Fowl for Parks and Gardens

A MONTHLY TREATISE ON THEIR CULTURE.

## PHEASANTS AS INSECTIVOROUS BIRDS.

By Prof. W. H. Olin, Colorado.

The pheasant, especially the Chinese ring-neck and English varieties, are the most valuable insectivorous birds, as well as the most attractive and eagerly sought game bird of all the species that can be reared in captivity or in a semi-domestic way and be kept in the district in which it is propagated.

The great majority in numbers and kinds of the insectivorous birds are migratory—are only with us a short time—while the pheasant, especially the kinds above mentioned, becomes attached to the locality and will breed and remain there as long as they are protected and can secure food.

Thousands of these gorgeously plumed pheasants

CHINESE RING NECK PHEASANT

with a wealth of feathered adornment, some of which shine in the sunlight as burnished gold and bronze of many shadings, with grace of form and carriage, the private property of W. F. Kendrick, in charge of his own game keepers, are kept on exhibit at City Park, Denver, for the education and entertainment of the visitors, yet few realize their economic value.

The pheasant is naturally an insectivorous bird, and where such food is obtainable he will eat compara-

The variety of the insect food of the pheasant is larger than any other bird, so far as known. Investigations show that over 130 species of insects, including earthworms, are eaten by the pheasant, and doubtless many more will be found to

share in its menu.

In addition to this it is especially fond of small rodents, such as field mice, young gophers and small snakes. England a number of pheasants have been found choked to death in the attempt to swallow worms larger or longer than they could manage; also several pheasants have been found dead, choked on small rodents.

The keeper of most any large pheasantry has seen his pheasants catch mice that were stealing the grain from the birds. This is verified by Mr. Fred Barnett, superintendent of the pheasantries at City Park, Denver, Col. Mr. Barnett says that a pheasant hen will catch and destroy a mouse as quickly as a cock pheasant or cat, as he has frequently watched them in the act.

Among the insects destroyed by the pheasant are included smelling bugs, that most birds will not touch -this makes these birds more valuable to the farmer than any other.

Prominent among the pests ravenously destroyed are the Colorado potato beetle, the squash bug, the cucumber beetle, the bean leaf beetle, tomato worms, cut worms and the millers which deposit the eggs for the wire worms. The pheasant also digs for and eats the wire worms, as it does all ground worms and bugs, and practically all kinds of ground beetles. Most birds avoid the potato and other bad smelling bugs on account of their obnoxious odors, but the pheasant hunts and eats them.

The pheasant chooses the dandelion and the bulbs of buttercups as two of its greatest vegetable delicacies. He eats but comparatively few buds from bushes and trees, excepting in severe winters. In this way he is quite different from the grouse. Of the grasses he has liking for white and red clover, alfalfa and red and yellow sorrel, but when there are plenty of dandelions and buttercups he will make those his principal vegetable diet.

In the winter time pheasants can be seen turning over forest leaves and examining them and picking off the larvae of different tree insects deposited on the under side of the leaves; also picking over the top soil around bushes and trees for the bugs and larvae.
Tegetmeir-English says: "The value of pheasants

to the agriculturist is scarcely sufficiently appreciated; the birds destroy enormous numbers of injurious insects—upwards of 1,200 wire worms have been taken out of the crop of a pheasant; if this number was consumed in a single meal the total destroyed must be almost incredible."

It is fond of carrots, potatoes, beets, cabbage and turnips in the winter time, although if dandelions are fed to caged pheasants they will eat them in preference to most any vegetable food, roots and all.

The pheasant is also very fond of many of the wild weed seeds, such as legumes, thistles, especially the burr thistle, wild carrots, sunflowers, wild lettuce. mayweed, marsh elder and mustard seeds.

\*Continued on page 320.)

DOMESTICATED MAILARD DUCKS ON THE LAKE IN GRANDS FARM, THE COUNTRY HOME OF AUGUST A. BUSCH, ST. LOUIS, MO (See page 323.)

#### EUCHARIAS AMAZONIEA.

The accompanying illustration, which shows a house of the well known choice exotic plant Eucharias Amazoniea, is a collection grown by William Morrow, superintendent of Mrs. H. O. Havermyer's estate, Palmer Hill, Stamford, Conn. It should be grown more generally where fine flowering stock is found, for there are few flowers that can be called superior to the white flower of the Eucharias.

A side bench in the palm house, where they will have some shade and bottom heat, will suit them nicely. They would also do well on a back bench of a rose house, but shade would be necessary in such a position. A bench three feet wide, of cypress boards one and a half inches thick, placed half an inch or more apart, so as to insure good drainage, seems to suit them. Two inches of roughly chopped, fibery sod, with part of the soil shaken out, should be spread over the boards or bench bottom and pressed down level. The bench can then be filled with chopped sod and leaf mould or old manure in equal parts and with a good cast of sheep manure and crushed

A HOUSE OF EUCHARIAS AMAZONIEA. THIS PLANT IS RARELY GROWN IN SUCH QUANTITY,

charcoal well mixed in. This will subside an inch or more after being planted and watered. Set the bulbs in rows across the bench, about nine inches apart in the row and sixteen inches between the rows. This may seem rather wide at first, but during the second year the space will nearly all be taken up, they make sidings so fast.

There ought to be room for the hand with the hose to get in to spray the under side of the leaves. This is important, as it is the only cleaning to keep down insects, and should be done right along, except when the flowers are open. When the bench has been filled with roots an occasional dose of manure water should be given during the six weeks of their growth. When the last leaf is almost full size and no new ones coming up, it is time to withhold water from the bench, except what they get in the way of spraying of the leaves, which will generally keep the soil damp enough.

Care should be taken not to let the soil get dust dry at any time, even when resting, which will take five or six weeks. As soon as they begin to send up a few flower spikes the bench should get a thorough watering. Two days after give another, this time with sheep or cow manure. The temperature need not be over 55 at night and better spikes of flowers will be obtained than if more heat is given. In the growing period the heat had better be kept up to 60 or more. The first year one good crop of flowers is all that should be expected, but after that two or three good crops a year,

with a few straggles between time, can be had. A bench planted this way, three feet wide and 30 in length, will give over 300 spikes at one crop after the first year. And a house with several such benches could be kept producing almost continuously with a little juggling in growing and resting at different periods.

#### PHEASANTS AS INSECTIVOROUS BIRDS.

(Continued from page 319.)

As a table food, and also as a game bird, the pheasant has been held as the leading bird for these two qualities by the kings, royalty, wealth and educated people of the world for more than two thousand years as being of the greatest sport and richest delicacy. No other bird has held such a position, and it will be a long time before any other bird can gain such distinction.

The home of the Chinese ring-neck is largely in the mountains, as well as in the valleys of China, and they are accustomed to very severe weather, as it inhabits

the high altitudes, and yet adapts itself to the lower altitudes, as low as sea level. It is a thoroughbred bird and has been imported into England in considerable numbers to breed up the English pheasant. Chinese ring-neck pheasants are doing well liberated in the mountains of Colorado up to 9,000 feet altitude.

The Fcathered World, London; Frank Finn, F. Z. S., says: "The Chinese pheasant, like his human fellow countrymen, is very hardy, and will thrive anywhere, bearing the cold of a northern United States winter and the heat of a Bengal summer quite well. It is also a good breeder and bears confinement well."

At the last annual meeting of the New York Zoological Society \$60,000 was given to be used entirely for the study of pheasants and the best methods to be

adopted for the introduction and distributing of these birds into the United States.

In a number of States the next Legislature will be asked to pass liberal appropriations for propagating the pheasant and other insectivorous and game birds and the distribution of literature to instruct and aid the people in the hatching of the eggs.

#### THE VALUE OF CULTIVATING.

Go where one may at this time one sees cultivators busily at work in all the fields. This is one of the operations cease-lessly performed by farmers and gardeners, as the value of surface scarifying, not only for the elimination and prevention of weed growth, but for the conservation of moisture, has been appreciated for many years, and its value proclaimed from the house-tops, so much so that the least experienced of growers knows its value. We have had sufficient rains in most sections to keep the heavier soils supplied with moisture for the next five, six or seven weeks, provided that this surface tillage is maintained. What this cultivating does is not theoretical, and is a matter of fact; it breaks the capillary tubes of the soil, and by choking them over with a dust mulch, prevents evaporation. This evaporation goes on all the day in caked and rain-beaten soil, whereas the dust-like or broken surface is an antidote to it.

One thing should be noted in connection with irrigation systems: the grower is apt to water at short intervals and instead of giving a soaking, gives comparatively small amounts. This causes a surface rooting tendency in the plants and develops soft growth. The proper thing is to give eight or nine hours of steady overhead irrigation, which would be equal to about an inch of rain, thereafter to allow the ground to dry out as it would do naturally after rain, and instead of watering, to cultivate just as one would if the irrigation system did not exist.—Florist

## Flower Shows as Business Promoters

The First National Bank of Joliet, Ill., held its first annual flower show on June 10, 11 and 12.

In the May number of The Banker (the house organ of the First National) which is sent out to 12,000 homes in Will county, there was an announcement of the flower show, inviting everyone to attend and to exhibit any flowers they might have growing in their gardens. In this announcement the offer of the prizes was made. The four first prizes were silver trophy cups for the best exhibits of three red peonies, three white peonies, three pink peonies and the best collection of irises. The four second prizes in these classes were full year subscriptions to The GARDENERS' CHRON-ICLE OF AMERICA. The general conditions that governed the contest were also stated, namely, that all flowers shown in competition must have been grown in Will county by the exhibitor; that no exhibitor could take more than one prize.

Willard Clute, editor and publisher of The American

Botanist, acted as judge.

When the show opened on the morning of June 10 the bank was gorgeous in color with artistically arranged masses of peonies, irises, carnations, garden and hot house roses, pansies, gladioluses, sweet peas and phlox grouped in the center and along the sides of the banking room. Large jars filled with peonies were arranged along the balcony railing and on top of the cages. Down the length of the banking room stood a table on which were close to seventy-five exhibits of peonies and irises entered in competition.

The exhibits of the six florists of the city played no small part in the success of the show. Each was distinctive and individual.

For three days crowds of people came and went, many returning with their friends and members of their families. The officers were in constant attendance making friends with the visitors. Every day interesting novelties in plants and floral pieces were brought in and the spent flowers were replaced by fresh ones. The show brought such crowds of people to the bank, and the interest of the community in the show was so strong that it was decided to make it an annual affair. From a publicity point of view the bank has never attempted anything that was more successful.

Thousands inspected the flower show which was held on Saturday, June 12, at the Second National Bank, Paterson, N. J., under the auspices of the Paterson Floricultural Society. Hundreds of magnificent blooms were exhibited and a great deal of interest was shown in the awarding of prizes. The judges were: James McCollom, superintendent of the public parks; Arthur Vescelius, florist, and Thomas Heminsley, a grower. The entire display was under the management of Wessels Van Blarcom, assistant cashier of the bank.

The flower shows which are given at the Second National Bank are the result of a suggestion made by Mr. Van Blarcom two or three years ago that the Paterson Floricultural Society bring in some of their

best blooms for the benefit of those who may love to look at flowers, but are not especially fortunate in growing them. Once started, the shows have continued. In the spring roses and peonies, with such other flowers as exhibitors choose to bring in. Again in the Fall dahlias and other Fall flowers, with chrysanthemums to close the season. Thousands of visitors go in to see the blooms and a considerable proportion of them go away determined that they will grow flowers themselves next year. The Paterson Floricultural Society is made up of enthusiasts in floral culture and they have given freely of their time and influence to make these shows a success.

# Concrete for the Country Home

The present insistent demand for the substitution of durable, sanitary and fire-resisting materials for those not possessed of these properties has been a pronounced factor in hastening the adoption of concrete. The change means impervious and monolithic structures as opposed to those consisting of the more familiar types of masonry with their attending wooden features of combustible nature, the latter also affording refuge for much that is noxious and unsanitary. This enduring method is now applied to all sorts of construction work.

Small buildings, for one purpose or another, are always required on the country estate. These structures include garages, stables, wagon houses, poultry houses and buildings designed for many other purposes. A common source of annoyance and expense is the decay or giving way of building supports and foundations. When this occurs it is considerable trouble to replace these with new timber or ordinary masonry. It frequently happens that a building is in first-class condition while its supports have disintegrated or collapsed.

The following situation is to be found on many coun-

used, the mixing methods and the care necessary to obtain the best results.

Concrete—a manufactured stone—is made by mixing together Portland cement, sand and stone (or gravel). Various proportions of each are used, depending upon the use to which the concrete is put. About half an hour after mixing these materials together, the mass begins to stiffen, until, in from half-a-day to a day, it becomes so hard that you cannot dent it with the hand. By a month the mass is hard, like stone—indeed, harder than most stones.

It is important that your stock of cement be kept in a dry place. Once wet, it becomes hard and lumpy, and in such condition is useless. If, however, the lumps are caused by pressure in the store-house the cement may be used with safety. Never, under any circumstance, keep cement on the bare ground, or pile it directly against the outside walls of buildings.

Do not use very fine sand. If there is a large quantity of fine sand handy, obtain a coarse sand and mix the two sands together in equal parts; this mixture is as good as

TROLLEY POLE AND LIGHTING STANDARD OF CONCRETE.

CONCRETE SAND BOX FOR GOLF

CONCRETE INLET-EASY TO DRAIN.

try places: A comfortable and well-built house with substantial barns and outbuildings. Between these buildings run the roads or walks used many times each day, but hundreds are simply thoroughfares of mud during frequent periods but especially in the spring, when the frost is coming out. They certainly are a false and discordant note in an otherwise attractive environment.

Nothing gives more trouble and injures the appearance of property so greatly as sagging gates and fences caused by rotten gates and corner posts.

Terraces too steep will not stay sodded and frequently cause endless trouble and spoil the general appearance of an otherwise fine lawn.

There is nothing that pleases the appetite so much as delicacies out of season. As for vegetables, they are not costly luxuries and are within the means of any one who will take the time to build a hot-bed or cold frame.

In a series of articles to appear in these columns it is the purpose to briefly describe different methods of concrete construction without the aid of expert mechanics, as they apply to its use on country estates and suburban home grounds, discussing, in this number, the material coarse sand alone. Sometimes fine sand must be used, because no other can be obtained; but in such an event an additional amount of cement must be used—sometimes as much as double the amount ordinarily required. For example, in such a case, instead of using a concrete, 1 part cement, 2 parts sand, and 4 parts stone, use a concrete, 1 part cement, 1 part sand, and 2 parts stone. Besides being coarse, the sand should be clean, i. e., free from vegetable matter. "But," you say, "how shall I tell whether the sand is what you call clean?" The presence of dirt in the sand is easily ascertained by rubbing a little in the palm of the hand. If a little is emptied into a pail of water, the presence of dirt will be shown by the discoloration of the water.

Stone or gravel is known as the "coarse aggregate" of concrete. Great care should be used in its selection. The pebbles should be closely inspected to see that there is no clay on their surface. A layer of such clay prevents the "binding" of the cement. If necessary stone or gravel may be washed in the same way as above described for sand. Indeed, it is more easily done than sand, as the water flows through the larger voids in the gravel more

readily than through the voids in the sand. Dust may be left in the crushed stone without fear of its interfering with the strength of the cement, but care should be taken to see that such dust is distributed evenly through the whole mass, and when dust is found in stone, slightly less sand should be used than ordinarily.

As to the size of stone or gravel, this must be determined by the form of construction contemplated. The best results are obtained by the use of a mixture of sizes graded from small to large. By this means the space or voids between the stones or pebbles are reduced and a more compact concrete is obtained. Moreover, this method makes it possible to get along with less sand and less cement.

Water for concrete should be clean and free from strong acids and alkalies. If you are at all in doubt about the purity of the water that you contemplate using, it would be well to make up a block of concrete as a test, and see whether the cement "sets" properly.

As above explained, concrete is composed of a certain amount of cement, a larger amount of sand, and a still larger amount of stone (or gravel). To determine how much of each of these materials to use, we must first consider the type of work we wish to undertake.

There are three kinds of mixtures, in general, in con-

crete work:

1. Very wet mixture.—Concrete wet enough to be mushy and run off the shovel when handling; used for thin walls or for thin sections, etc.

2. Medium mixture.—Concrete just wet enough to make it jelly-like; used for foundations, floors, etc. To better describe this mixture it may be said that a man should sink ankle deep if he were to step on top of the pile

3. Dry mixture.—Concrete like damp earth, used for foundations, etc., where it is important to have the con-

crete "set up" as quickly as possible.

The difference between the mixtures is, that the dryer the mixture the quicker will the concrete "set up"—but in the long run, when carefully mixed and "placed," the results from any of the above mixtures will be identical. It may be said, however, that a dry mixture is the harder to handle, must be protected with greater care from the sun or from drying too quickly; and lastly, is likely—unless used by most experienced hands—to show voids or stone pockets in the face of the work when the "forms" are removed. The less the voids in the stone or gravel, the greater will be the volume of the concrete.

No time should elapse between the "mixing" and the "placing." Directions for placing must of necessity be general, the important thing to remember is, that the

materials should not separate in placing.

In order to obtain a smooth face on the concrete, the mixture should be carefully "spaded" immediately after "placing"—on the side next to the form where the finished concrete will be exposed to view. By "Spading" is meant the working of a spade or beveled board between the concrete and the side of the form, moving it to and fro, and up and down. This forces the large stones away from the boarding, or form, and brings a coating of mortar next thereto, thus making the face of the work present an even, smooth appearance.

Green concrete should not be exposed to the sun until after it has been allowed to set for five or six days. Each day during that period the concrete should be wet down by sprinkling water on it, both in the morning and afternoon. This is done so that the concrete on the outside will not dry out much faster than the concrete in the center of the mass, and should be carried out carefully, especially during the hot summer months. Old canvas, sheeting, burlap, etc., placed so as to hang an inch or so

away from the face of the concrete will do very well as a protection. Wet this, as well as the concrete. Often the concrete forms can be left in place a week or ten days; this protects the concrete during the setting-up period and the above precautions are then unnecessary.

It may be well, in summing up, to emphasize the following points: 1. The materials must be perfectly clean.

2. The mixing must be in proportions carefully determined. 3. The mixture must be used while absolutely fresh. Good results cannot be obtained unless you use a good cement, nor will the work be at its best unless care is taken in the selection of clean sand and clean stone.

Among the uninitiated, there is an all too prevalent idea that anything is good enough for the making of concrete. Some will tell you that sawdust, shavings, mud, clay, etc., will do to complete the mixture, but the absurdity of this notion will very soon become evident to anyone who neglects the precautions which have been above pointed out

(To be continued.)

## DOMESTICATING THE MALLARD DUCK.

By L. P. JINSEN, MISSOURI.

Perhaps one of the most interesting sights to be witnessed, at any time, at Mr. August A. Busch's Grant's farm, near St. Louis, Mo., is the large number of mallard ducks.

Several years ago a few domesticated birds were secured, and the flock now numbers several hundred. It is a beautiful sight to behold when several of them take wing and circle over the property, eventually alighting on one or the other of the watercourses or lakes on the place.

At present the female may be found on stumps of old trees, or in the underbrush near the water, hatching her brood of youngsters. Many of them are also to be seen with their brood of little ducklings swimming on the water, busily devouring any insect that may come within their reach. These little ducklings are very interesting to observe, as they are very active and rapid in their movements, darting in all directions as quick as a flash, yet remaining close to the mother bird.

The nesting females are so tame that you may almost step on them before they attempt to leave the nest, and in most cases, they permit you to touch them with your hand.

They are regularly fed with wheat and other grain, and remain on the place all year. They require very little care and protection. They are never pent up, and seldom take advantage of the house put up for their protection.

The mallard duck seems to create confidence among other species of wild ducks, which have become regular visitors to the place, and permit you to approach very close to them before they alight.

The accompanying illustration shows a small group of them in their favorite element.

(See illustration, page 319.)

OUR QUERIES AND ANSWERS column is omitted from this number due to lack of space. It will appear in the August number. Have you any inquiries to make?

JULY, 1915.

No. 7.

In her book, The Well-Considered Garden, Mrs. Francis King devotes a chapter on The Question of the Gardener, extracts of which, through the courtesv of the author and her publisher are presented on page 311. She frankly acknowledges the lack of appreciation the average American manifests in the efforts of his gardener, and concedes that a good cook or a speeding chauffeur oftentimes receives greater consideration. Of course, Mrs. King refers to the gardener on the large estate, and not those employed on small home grounds. We agree with her that the compensation of the class she terms the Head Gardener should be at least one hundred dollars per month, with his cottage and privileges, while we realize that the compensation of what she terms a "working gardener" must be governed to a certain extent by their responsibilities. As for the manager or superintendent of the country estate, we fear that the owners of these establishments are not as thoughtful of them as they are of the heads of the departments of their business enterprises, for many of the latter with far less responsibilities than some of the

estate managers must assume, are comfortably enough situated through the recompense they receive to employ gardeners. Few vocations call for greater ability than that of the manager of a complete country estate. Ostensibly a gardener, he must have a knowledge of engineering, construction work, farming, cattle, forestry and much else that is demanded in estate management, besides executive ability and an ability to handle men. In many instances he is even provided with a banking account with which to finance the operation of the estate. And we know of gardeners who creditably fulfill such positions at figures well below the \$150 mark. We choose to ascribe such existing conditions, first, to the utter thoughtlessness on the part of the average owner of an estate of the value of the service his superintendent renders him as compared with the remuneration he receives for it; second, that many an estate owner takes no further interest in his establishment than to have it maintained as lavishly as that of his next door neighbor's for appearance sake, but continuously begrudges the expenditure involved in doing so. We firmly believe, however, that the gardener's effort is more appreciated in this country today than it ever has been and that he is gradually gaining the recognition due him. He is indebted to the author of The Well-Considered Garden for the attitude she assumed in his behalf in The Ouestion of the Gardener, and which undoubtedly will provoke considerable discussion on this subject.

The reports appearing in another column of flower shows held recently as business promoters by two progressive banks offer a suggestion that could profitably be adopted by other business institutions as a means of securing general publicity, and providing a method for securing some effective advertising on an economical basis, that could not be obtainable from other sources. We commend the holding of flower shows to our business friends who may be engaged in enterprises catering to the general public. They provide healthy and educational entertainment, and will bring patronage to any institution that will provide an interesting show. This applies more to the smaller cities than to our large metropolitan districts, although even in large cities a business institution that will properly exploit the holding of a flower show within its walls can draw large crowds to it.

#### THE FATHERLAND.

Where is the true man's fatherland? Is it where he by chance is born? Doth not the yearning spirit scorn in such scant borders to be spanned? Oh, yes! his fatherland must be As the blue heaven wide and tree!

Is it alone where freedom is, Where God is God and man is man. Doth he not claim a broader span For the soul's love of home than this? Oh, yes, his fatherland must be As the blue heaven wide and free!

Where'er a human heart doth wear Joy's myrtle wreath or sorrow's gyves. Where er a human spirit strives After a life more true and fair. There is the true man's birthplace grand His is a world-wide fatherland!

Where'er a single slave doth pine. Where'er one man may help another-Thank God for such a birthright, brother -That spot of earth is thine and mine! There is the true man's birthplace grand, His is a world-wide fatherland! James Russell Lowell

## NATIONAL ASSOCIATION OF GARDENERS

JOHN W. EVERITT, President, Glen Cove, N. Y.

OFFICIAL COMMUNICATIONS

M. C. EBEL, Secretary, Madison, N. J.

#### ASSOCIATION NOTES.

An executive meeting of the trustees and board of directors will be held on Wednesday, July 14, at the Hotel Martinique New York City, to complete the plans for the summer meeting to be held in San Francisco during the third week of August. and to act on several other important matters in the interest of the association, which are to be brought before the meeting.

The Co-operative Committee is anxious to begin an active cooperative campaign between the local horticultural societies early this fall. The committee was created for that purpose, but without the assistance of the local co-operative committees, which have been appointed by the various local societies to work in conjunction with the co-operative committee of the national association, the last named committee can accomplish little, for it is but an instrument, so to speak, of the local committees. The members of the national committee will welcome suggestions from any member of the association on the subject of producing a greater co-operation between all horticultural bodies. Communications should be addressed to the Co-operative Committee, in care of the secretary of the association.

The gardeners' national association has during the last three years gained considerable recognition as an influential factor in horticulture. In order to make it even a greater factor than it now is the organization must increase the strength of its membership so that its influence may be spread. To accomplish this every member should aim to introduce at least one new member into the association, and should strive to do so at once. so that when the next convention convenes we may be able to report a substantial gain in our membership roll,

The article on the "Question of the Gardener" by a prominent amateur, published on another page, should have the careful attention of every gardener interested in the future of his profession. Whether you will agree or not, with all the writer of it advances, is not paramount the issue for consideration is that it should be discussed at all from practically the gardener's standpoint by one wholly outside of the profession. The first shot has been fired; it is now up to the gardeners themselves to keep up a campaign of education to enlighten the uninitiated that there is a distinct difference between real gardeners and the class of so-called gardeners, many of whom are filling positions, which, if occupied by efficient men, would prove more creditable to the gardening profession, and give more satisfaction to the garden owner, who, while it may cost him more, would get his money's worth.

Duplicate bills are being sent to members who have not yet paid their 1915 dues, and to those who are more delinquent. By taking a life membership, which will cost you \$25, you are exempt from all dues and from the annoyance of having to remit once a year. Some members have already expressed their intention of taking out life membership before the end of the year. Life membership dues are deposited in a permanent fund

#### THE LAST CALL!

If you are going to accept the invitation of the American Association of Park Superintendents to join its members on their trip to San Francisco and return, you must decide now. Scretary Cotterill of the A. A. P. S., writes:

"If you miss this special train party you will regret it, as

it will be the last word in convenience of travel, and a trip through a scenic wonderland with stop-overs at cities which have progressed very rapidly in modern park development during recent years. There will also be entertainment free which ordinarily would amount to a hundred dollars of expense. Remember, members of kindred organizations are welcome to join this party and take advantage of these features."

The party departs from New York, Saturday forenoon, Aug. 7; Chicago, Sunday evening, Aug. 8. Arrives San Francisco, Aug. 16. Leaves San Francisco, Aug. 24; Los Angeles, Aug. 29. Arrives New York, Sept. 7.

Full particulars can be obtained by addressing your secretary, M. C. Ebel, Madison, N. J.

## Of Interest to Gardeners

A larger membership in the National Association of Gardeners will mean greater strength for the organization, and will spread its influence for the development of ornamental horticulture in America.

Your neighbor may not yet be a member. Why not secure his membership? He is only waiting to be asked.

## AMONG THE GARDENERS

The many friends of Herbert W. Clarke, of Manchester, will be sorry to learn that he is laid up with a broken leg.

A party of about one hundred will go from Boston to the Newport Sweet Pea Show, and will visit some of the leading private estates there on July 15,

Increased interest is being taken in rock gardens in Massachusetts and quite a number of estates are making a start in this branch of gardening.

William Roberts, late of Readville, Mass., returned to Great Britain some time ago and is now at the battle front with the Royal Welsh Fusiliers.

The Garden Committee of the Massachusetts Horticultural Society, visited the noted rose gardens of Miss S. B. Fay, Woods Hole, Mass., on June 24, and M. H. Walsh, who has charge, was able to show them a wonderful display of roses.

Boston is planning to hold two big shows in 1916 one either in March or May, and the other in November. Popular sentiment favors March in preference to the May exhibition.

George G. Milne, who recently returned from a visit to his home in Ireland, has secured the position of gardener at the Homestead Hotel, Hot Springs, Va.

George W. Hess, superintendent of the United States Botanic Gardens, Washington, D. C., will leave shortly for New Orleans, by steamer via New York, to become the guest in that city of Schatter Robert F. Bronssard.

Joseph Dexter has resigned his position as superintendent at Brooklake, the estate of Howard Cole, Madison, N. J. ≝ynamidonaes este east of a a a composition of the asternational and the composition of 
## Of Interest to Estate Owners

The National Association of Gardeners maintains a Service Bureau which is at the disposal of all who may require the services of efficient gardeners in their various capacities.

The association seeks the co-operation of estate owners in its efforts to secure opportunities for those engaged in the profession of gardening who are seeking to advance themselves. It makes no charge for services rendered. It endeavors to sup-ply men qualified to assume the responsibilities the position may call for.

Make your requirements known to

M. C. EBEL, Sec'y, National Association of Gardeners, Madison, N. J. 

# Gardeners Inspect "Homewood"

The pleasant relations that exist between some estate owners and their superintendents were manifested on Monday, June 21, when R. B. Ward, the genial owner of "Homewood," a charming country estate situated among the hills of Westchester County, at Wykagyl, New York (described in the last issue of the Chronicle), extended an invitation to some sixtyfive gardener friends of Nicholas Butterbach, his superintendent, to inspect a new French fruit garden that has recently been completed on the estate by Mr. Butterbach. The members of the party, traveling by various routes, journeyed to New Rochelle and were there met at the station by Mr. Butterbach. After many greetings by old acquaintances, the party boarded a special car that Mr. Ward had chartered for the occasion and proceeded to "Homewood," where, after an inspection of the grounds, they became his guests at luncheon.

After lunch Arthur Herrington brought the gathering to order and called on Mr. Butterbach whom, he stated, some knew as such, while others knew him more familiarly as Nicholas Butterbach; "but," he remarked, "there are some among us who have been intimately associated with him so long that we know him only as 'Old Nick.'" He referred to Mr. Butterbach's long and brilliant career as a gardener and one who can be accepted as an authority on almost any subject pertaining to horticulture.

Mr. Butterbach, in responding, was found in a reminiscent mood and related some of his early experiences as a gardener. On behalf of Mr. Ward, Mr. Butterbach extended a cordial welcome to the visiting gardeners and expressed for Mr. Ward, who had planned to receive them on the estate, his regrets for being unable to be present, as he was unexpectedly called away earlier in the day. Reverting to the subject on which he desired to speak, Mr. Butterbach said that he received his early training and experience in

dwarf fruit tree culture under the watchful eye of a student of the originator of the dwarf fruit trees in France. He explained the various methods of cultivation and the necessity of proper pruning and pinching (which will be reported in more detail in the August issue of the Chronicle). The party then withdrew to the French fruit garden, where Mr. Butterbach gave some practical demonstrations of summer pruning as a means of developing fruit spurs and bringing trees into bearing. Many questions were asked and ably answered by Mr. Butterbach, which left no doubt in the minds of the visitors that he is a master of his art.

The lecture over, other prominent features of the place were inspected, among which may be mentioned the extensive herbaceous garden, adjoining the fruit garden. The sunken garden containing many varieties of old-fashioned flowers, was the source of much interest. The rose garden, which contains many of the finest varieties of out-door roses, was next inspected. The somewhat extensive range of green houses also proved of more than passing interest.

At this stage of the tour of inspection the arrival of the photographer was announced and the visitors repaired to the stretch of lawn in front of the mansion to be photographed.

The next point of interest to be inspected was the farm part of the estate, which is well equipped with modern farm buildings, but as the party was about to proceed there it was found that the time had passed so rapidly that many had to leave at once in order to make their train to get home the same evening. Those who had the time to spare, visited the farm buildings and found much to interest them, after which those remaining expressed themselves freely in appreciation of all they had seen, heard and enjoyed at Homewood.

On the motion of John W. Everitt, president of the National Association of Gardeners, a hearty vote of thanks was accorded to Mr. Ward for his kind invitation and hospitality, and to Mr. Butterbach for his practical talk on fruit growing and other courtesies extended the party while visiting the estate.

GATHERING OF GARDENERS AT HOMEWOOD, THE FSTATE OF R B WARD, WYKAGYI, NEW YORK,

# AMERICAN ASSOCIATION OF PARK SUPERINTENDENTS

OFFICIAL COMMUNICATIONS.

G. X. AMRHYN, Pres., New Haven, Conn.

R. W. COTTERILL, Sec.-Treas., Seattle, Washington.

### ASSOCIATION NOTES.

The Convention Committee met in San Francisco on June 14 and 15, with Secretary R. W. Cotterill, John McLaren and Daniel MacRorie present, every detail of arrangements and program being taken care of in accordance with summary as outlined elsewhere in this department. The Board of Park Directors of Oakland will co-operate with San Francisco in making the convention a success and those who attend will have no regrets, as it will undoubtedly be a banner convention and the Exposition, San Francisco and the entire Pacific Coast will be a revelation to those who are fortuate enough to see them.

The sessions of the convention will be held in the new municipal Civic Auditorium, a magnificent structure, which is a part of San Francisco's civic center, and is directly across from the new city hall, the finest in America. Our convention hall will be on the same floor as the hall and exhibit of the S. A. F., so that members can conveniently go from one to the other, as both will be in session at the same time.

In the matter of selecting a hotel, the committee had in mind that the convention trip is going to be a long and expensive one for many of our members. Too often the mistake has been made of having as headquarters the fanciest hotel in the city, with prices which were a burden, and the secretary has heard many complaints on this score, hence decided to select a modest hotel which would meet our requirements.

San Francisco is a tourist city, this is Exposition year and the big hotels have a scale of prices which will put a crimp in the purses of tourists who go to the best known hostelries. The committee decided upon the Stewart Hotel as headquarters and reservations have been made for one hundred persons for our dates. The Stewart is a modern hotel of 300 rooms, very conveniently located just off Union Square and across the street from the St. Francis Hotel, which will be the headquarters of the S. A. F. The rates at the Stewart for our party will be on the European plan, as follows: Single room (detached bath). one person, \$2; two persons, \$3 per day. Room with private bath, one person, \$2.50; two persons, \$4 per day. Double room, tiwn beds, with private bath, \$4.50 per day. The hotel has an excellent cafe with modest prices and there are numerous cafes within a few doors. The hotel is in the heart of the theatre and hotel district. Write your reservation direct to the Stewart Hotel Co., stating just what you want, when you will arrive, and be sure you state that you are with the Park Superintendents' party, as the Stewart is a very popular hotel and is usually

New Orleans is going to make a strong bid for the 1916 convention and will have representatives on the ground to work for it. The secretary has on hand invitations from the mayor, governor and various commercial organizations, so St. Louis had better look to its laurels.

Secretary Cotterill has seemed two program teatures which will be a great card for our convention. Samuel Hill, millionaire good roads advocate, president of the Pacific Highway Association and past president of the American Good Roads (ongress, will present his famous lecture on "Good Roads," illustrated with magnificent colored slides of roads and drives all over the world. Mr. Hill has made twelve trips to Europe and has a wonderful collection of views of road construction. Good roads are his hobby and he has spent several hundred thousand dollars of his own money in putting in experimental sections of different types of roadways.

E. B. DeGroot, formerly of Chicago, now of San Francisco, probably the most eminent playground man in this country, will also be present at our convention and deliver an address. Quite a number of our members will have papers and addresses, so that at this session we will probably have more real instructive features than at several previous sessions.

The social features at this session will also be all that anyone could ask for, but will not be indulged in until the business is The exposition is a marvel, and San Francisco, Oakland and the other bay cities will offer sight-seeing trips that will never be forgotten.

### PRELIMINARY PROGRAM ANNOUNCEMENT.

Seventeenth Annual Convention, American Association of Park Superintendents, San Francisco, Cal., August 18-20, 1915.

Headquarters, Stewart Hotel, Union Square,

Convention sessions will be held at the Civic Auditorium. Special train party will arrive at San Francisco, Monday evening. August 16.

### TUESDAY, AUGUST 17.

Opening of convention of Society of American Florists and meeting of National Association of Gardeners. Executive Committee meeting of A. A. of P. S. Evening: Informal reception and dance at St. Francis Hotel.

# WEDNESDAY, AUGUST 18.

Convention Sessions: Morning, afternoon and evening, at Civic Auditorium.

Morning: Opening ceremonies; address of welcome by Mayor James Rolph; response by President G. X. Amrylin; admission of new members; report of oflicers; appointment of committees; introduction of resolutions, amendments to by-laws, etc.

Afternoon: Reports of committees; election of officers; new

and unfinished business; question box.

Evening: Addresses, papers, stereopticon lectures, closing ceremonies.

Ladies of the party will be given an automobile tour in after-

### THURSDAY, AUGUST 19.

Steamer trip around San Francisco Bay in forenoon; luncheon at Oakland, followed by auto tour of Oakland, Alameda and Berkley, as guests of the Board of Park Directors of Oakland; return by steamer to San Francisco, at 6 p. m.

Evening: Stag smoker for gentlemen of party at Elks (lub; theatre party for the ladies.

# FRIDAY, AUGUST 20.

All-day auto tour of San Francisco parks, boulevards and playgrounds. Panama-Pacific Exposition grounds and the picturesque rural districts of the San Francisco Peninsula; evening at exposition grounds amusement features on "The Zone."

# SATURDAY TILL TUESDAY, AUGUST 21 23.

Free for inspection of exposition, general sight-seeing and side trips. Party leaves for Los Angeles and San Diego at 8 p. m. Tuesday, August 24.

### DAMAGE DUE TO WEEDS.

While there are various definitions, a weed may be said to be a wild plant that has a habit of intruding where it is not wanted. Some weeds produce immense quantities of seeds. Some mature seeds in a very short time. Some have seeds difficult to separate from crop seeds. Some have roots or rootstalks that live for a number of years. They persist because well equipped by nature to hold their own. Weeds, however, are not always useless. Sometimes they are the principal means by which organic matter is restored to the soil, and, generally speaking, a soil is productive in proportion to the quantity of organic matter it contains. Turning farm land out to rest merely means that weeds are permitted to grow on it for several years. Weeds are also useful at times in preventing soil erosion, especially during the winter months, and serve a useful purpose in collecting and holding the nitrates and other soluble salts during periods when crops are not being grown, thus preventing these valuable nutrients from being washed out of the soil. Ordinarily, however, all these benefits may be realized through proper rotations, in which case it is a mistake to allow weeds to grow

The full reason why weeds reduce yields is not definitely known. It is well recognized that weeds deprive crops of moisture, plant food, and sunlight, and by these means cause decreased yields. Experiments have shown, however, that even where there is a supply of moisture and plant food sufficient for the needs of both weeds and the crop, weeds still exert a detrimental effect. This may be due in part to the weed roots giving off substances which are poisonous to crops. The fact that weeds do harm in more ways than has been supposed is all the more reason why the farmer should make strenuous efforts to subdue these invaders. Land that should produce 60 bushels of corn may yield no more than 20 bushels if weeds are not kept down by adequate

# Our Native Birds' Protectorate

Under the Direction of the Committees on Bird Protection.

National Association of Gardeners, L. H. Jensen, St. Louis, Mo., Chairman.

American Association of Park Superintendents, Herman Merkel, New York, Chairman.

# WHY A "CITY ORNITHOLOGIST?"

This question is undoubtedly being asked by some of the readers of the Gardeners' Chronicle, after reading the report of the committee on bird protection, published in the May issue, and a statement of the thoughts that induced the writer to add this paragraph to the report may lead to some valuable discussions and comments by Chronicle readers.

For sentimental reasons alone, I think, that, any large city could afford to pay for the protection of our native birds. To have the public parks and tree lined city streets abound with birds of song and color; to have the places now occupied by the European sparrow regained by our native feathered friends, would be worth many times the cost of the office of a city ornithologist.

American cities, as a rule, are not particularly sentimental, but require to be shown in a tangible way, that the result will be worth the cost, as measured by the standard of dollars.

We know, that the economic value of birds consists principally in their relentless and untiring warfare against insects injurious to vegetation. If the number of insectivorous birds is very greatly decreased, man must pay for the work of checking the destruction of vegetation by insects. The protection of our native birds would reduce, and in many cases entirely prevent this work.

Most articles relating to economic bird protection have considered the country districts, and their crops of grain and fruit, which of course must be protected at any cost, but, not so often is consideration taken of the value of protecting the city vegetation.

Within recent years, we are beginning to realize, that the trees and shrubs of our parks and streets are of great economic value to the ever increasing number of people who must live in cities.

In the country the enemies of birds are not as many as in the city. The English sparrow is not so common along the woody highways of the country, and the stray cat, one of the worst enemies of our birds, not so much in evidence as in the city.

At night large hordes of injurious insects are drawn to the bright lights of the city, there to perform their work of destruction, on the very form of vegetation which makes the living in cities possible.

Owing to the large number of insects attracted by the lights, insectivorous birds would come to the cities in large numbers, provided they were given proper protection. Hence the need of a city ornithologist.

A city ornithologist should be one who thoroughly knows birds and their habits. He should look after the distribution and placing of bird boxes and the distribution of food for the birds, at such times as feeding would seem essential. He should instruct the children, at school and at the playground, on the importance of the birds to the city and its inhabitants. He should protect the birds from their enemies, and work out a bird census of the city, which would show the annual decrease or increase of birds, etc.

We are confident that the effort for the protection

of birds in cities, if systematically carried out, would be of untold benefit to the city population of this country, and we wish to enlist the aid and support of every reader of the Gardeners' Chronicle, of every lover of birds, of every live civic organization, of every park board, and of every one interested in the betterment of city conditions.

L. P. Jensen, Chairman.

### BIRDS OF FIELD AND ORCHARD.

Birds are the gardener's best friends. This has been said many times before, in many ways, by many writers and observers. But it is one of the things that can bear repetition, and if anything new and compelling can be said, the repetition will be well worthy of attention. Besides, very, very few understand the extent of the birds' help in raising each year's crops.

One who begrudges birds the little fruit which they may eat in the fruit season is apt to forget that the fruit season is very short, while these helpers are working for him the year round. In the winter the woodpeckers, nuthatches, and brown creepers, are literally climbing up his trees-gathering insect larvae and eggs from trunk and limbs, bark creases and knot holes. In the spring, when leaf and flower buds are bursting, when all foliage is tender, and insect larvae begin to devour, warblers, greenlets, and kinglets come from the South by hundreds to search every delicate crevice and cranny of leaf, bud, and blossom; and were it not for these mighty pigmy hunters, our trees, fruit, and vegetables would literally be at the mercy of insects. Then, all summer long there remain with us bluebirds, wrens, robins, grosbeaks, kingbirds, flickers, orioles, thrushes, catbirds, all of which, while incidentally building nests and rearing young, spend most of their time protecting our trees, fruit and vegetables.

The greater portion of the food of these birds consists of noxious insects; and when a bird is not nesting or singing or sleeping it is usually searching for food.

It should be noted, also, that most birds feed their young entirely upon insects; and the open mouth of the hungry bird is proverbial. Most of our common birds raise two broods a year. Think of the number of insects necessary to feed from twelve to sixteen young wrens, or eight or ten youg robins! Young birds grow so rapidly that the amount of food they eat is simply astounding.

If one thus attracts birds to his garden he will find that they soon learn to be on hand when any plowing, spading, hoeing, raking or weeding is going on; for it is when the soil is disturbed that worms and insects are brought to the surface; and in approaching near to the worker to secure them, the birds, especially robins, become almost as tame and bold as chickens.

Black-billed cuckoos, kingbirds, orioles, are all very active in destroying beetles, grasshoppers, spiders, weevils, caterpillars, ants and click-beetles, the larvae of the latter being among the most destructive insects known. The grosbeak is the particular enemy of the potato beetle, while the robin, the house wren, the bluebird and cathird are all shown to subsist mostly on animal matter, the greater portion of which consists of insects.—Our Dumb Animals.

### PITTSBURGH HORTICULTURAL NOTES.

Mr. and Mrs. Benjamin Franklin Jones, Jr., entertained the members of the Garden Club of Allegheny county on the ninth at Fairacres, Sewickley Heights, their Summer home.

Mrs. William Thaw, Jr., whose country place, "As You Like It," is also on Sewickley Heights, recently entertained the club to hear Mr. Strassburger, of Philadelphia, talk on "Rock Gardens; the Methods of Making and the Flowers to Grow." Later the members accompanied Mr. Strassburger to Mrs. Thaw's rock garden, which he had just completed.

On August 14 the club will visit "Rachelwood Farm" (which really comprises a chain of nine farms), the country estate of Mr. and Mrs. James R. Mellon, in the heart of the Allegheny Mountains.

Mrs. Francis H. Denny is president of the Garden Club, which was organized in November, 1914, the other officers and Board of Directors including Mrs. James D. Hailman, first vice-president; Mrs. W. Henry R. Hilliard, second vice-president; Miss Alice Robinson, treasurer. Directors: Mrs. Harvey Childs, Jr., Mrs. Francis H. Denny, Mrs. James D. Hailman, Mrs. Benjamin F. Jones, Jr., Mrs. Finley Hall Lloyd, Miss Alice Robinson, Mrs. J. Stuart Brown, Mrs. George B. Gordon, Mrs. W. Henry R. Hilliard, Mrs. William Larimer Jones, Mrs. Richard B. Mellon, Mrs. William H. Mercur, Miss Priscilla S. Guthrie, secretary.

Neil McCallum, who has the distinction of being president of both the Florists' Club of Pittsburgh and the Botanical Society of Western Pennsylvania, and superintendent of the West End Park, is growing some unusual plants. Just now he is trying out an Agaponthus (African blue lily), and has three splendid specimens of Francoa ramosa saxifraga, from the Andes, the only ones in Pittsburgh; several of the Australian Melalenca Argenteum and varieties of the Eucalyptus Citriodosa, Globulus and Ficifolia. The park is a charming reproduction of an English garden. Mr. McCallum is a native of London, although of Scottish blood.

An interesting recent event in Schenley Park was the annual tree planting and outing of the Congress of Women's Clubs of Western Pennsylvania, held in connection with the annual outing for the blind. John M. Phillips, "the bird and tree man," of Carnick, who planted 2,000 mulberry trees in that suburb this year, was among those honored in naming.

About the same time the New Era Club dedicated an apple grove in Schenley Park to its past presidents and prominent men, including Superintendent of Parks George W. Burke.

It is reported that Andrew W. Mellon is about to construct a large greenhouse on his Squirrel Hill estate, Pittsburgh, Pa.

J. Hart Gibben, president of the Farmers National Bank, is also to have a new greenhouse on his grounds, Morewood Heights, Pittsburgh.

# BROOKLYN SOCIETY FIELD MEETING.

A delegation from the Brooklyn Institute of Arts and Sciences held a field meeting at the Nurseries of Bobbink & Atkins, Rutherford, N. J., on Saturday, June 26.

Besides being controllers of trees and plants, it seems that Bobbink & Atkins also have the power to order the weather—for it was ideal. The refreshing shower in the morning added greatly to the condition of the flowers.

The members of the Institute were pleasantly surprised at the wonderful Rose Garden which portrays truthfully the character of over 300 varieties of roses, new and old. The Herbaceous collection was also a center of attraction, and, all in all, the visit was greatly enjoyed and a success in every way.

# GRAND NATIONAL FLOWER SHOW, PANA-MA-PACIFIC INTERNATIONAL EX-POSITION, OCTOBER 21-26.

The Grand National Fall Flower Show is scheduled to last five days from October 21 to October 26, and will take place at the Palace of Horticulture in the Exposition Grounds under the auspices of the Pacific Coast Horticultural Society in conjunction with the Department of Horticulture. Special prizes for chrysanthemums in a contest open to all will include the Chrysanthemum Society of America's silver cup. Hitchings & Co.'s silver cup, the Wells-Totty prizes, the Henry A. Dreer prize, the A. N. Pierson, Inc., prize, the Elmer D. Smith & Co. prize, the National Association of Gardeners prize, the H. F. Mitchell's prize, the H. W. Buckbee silver cup and the Society of American Florists and Ornamental Horticulturists prizes.

In a Class A competition there will be medal awards as well as money awards ranging from \$3 to \$15—24 awards being made in all. This contest is open to all.

The Class B contest, open to non-commercial growers only, will include six money awards.

Class C, open to all, will be a contest for the finest Chrysanthemum plants, and consists of four different conditions, each of which will be awarded a prize, either a silver cup, a medal or a money prize.

Class D, cut flowers, money prizes and medals as awards will include displays of roses, carnations, lillies, herbaceus perennials, annuals, dahlias, and begonias.

Class E, open to all, with numerous prizes, monetary and otherwise, will be devoted to orchids of different varieties, palms, and other foliage and flowering plants.

Class G, open to all, best collection of vegetables.

Money prizes will be awarded.

Class H includes special features such as contests for the best table decoration with different flowers as features on different days, best vases of Chrysantheniums, best arranged baskets of flowering and foliage plants, of orchids and foliage, most artistic and original floral design, most artistic corsage and bridal bouquet, and best arranged basket of cut flowers.

Those in charge of the show will be H. Plath, manager, John R. Fotheringham, assistant manager, T. Taylor, secretary. The exhibition committee includes Daniel McRorie, T. Taylor, F. Pelicano, E. James, Angelo J. Rossi, D. Raymond, W. A. Hofinghof, Donald McLaren, Wm. Kettlewell, Wm. Munro, John R. Fotheringham, P. Ellings, and M. Poss. For full particulars and application blanks write H. Plath, 210 Lawrence avenue. San Francisco.

MT SHASTA, FROM THE CRAGS, CASTLE ROCK, CALIFORNIA.

# The South Path From The Pacific Coast

Practically everyone who plans to visit the California expositions this year will wish to extend his trip to include the many natural wonders of the West, as well as glimpses of the other Pacific Coast States. Instead of first seeing the expositions and then making side trips to other Western points, often retracing one's route, an excellent plan is to start from Portland, traveling down the coast through Washington and Oregon and through the wonderful valleys of California. Visits to the expositions may be followed by enchanting trips through Arizona and the Southwest, concluding the journey by steamship from New Orleans. To arrange your journey in this way, over the Southern Pacific route, is

to weld it into a well-balanced whole, a tour which will more than meet your liveliest antici-

pations.

The trip from Portland to San Francisco, by the "Shasta Limited," or by one of the other three trains on the Shasta route, is a success -a of never-to-be-forgotten sights. You pass through the Willamette Valley, whose great agricultural possibilities the thrifty Pennsylvania Dutch were the first to discover many years ago. You climb to the summit of the Siskiyous 4,125 feet above sea level over a

series of horseshoe curves, where the track winds around the mountain one level above another and one tunnel above another tunnel.

AROUND MOUNT SHASTA.

Mount Shasta's snow covered crest, 14,380 feet above sea level, soon appears, to remain in sight for four hours or more. As we approach nearer and wind about its base, it is now on one side of the train and then on the other, affording the nearest car window view of any California mountains of such magnitude or beauty.

Here the Sacramento River has its source, flowing 350 miles due south, through the broad Sacramento Valley. From source to mouth, our train is to follow its course,

through timber and canyon, across steel bridges or clinging to the mountain side, coming out finally to run for two hundred miles or more through the bottom lands themselves.

On our way, we may have been fortunate enough to have the novel experience of a car window view of an active volcano, for Mount Lassen at the head of the Sacramento Valley awoke on May 30, 1914, from 200 years of sleep, and now it can be seen some 40 miles away from the railroad, emitting large volumes of smoke and ashes

and rock in eruptions as violent as they are sudden.

### THE EXPOSITIONS.

If you would visit the Yosemite National Park, or the city which the Spaniards loved to call the city of the angels, Los Angeles, or the Arizona National Reserve, or historic old San Antonio, or quaint old New Orleans, the Southern Pacific Sunset Route is the logical one for you to follow.

There is little need for one to speak of the two expositions. There is scarcely a person who has not read of the exhibits that come from all over the world and the magnificent buildings in which they are housed. Fifty million dollars, that at San Francisco has cost, and its eleven great palaces form the central setting of a beautiful picture, on the shores of a land-locked harbor, rimmed around by mountains, with a turquoise California sky over all. The exposition at San Diego was never meant to be a rival of the San Francisco one, but it epitomizes the spirit of California, an atmosphere of Spain with the life and activity of modern California. The buildings, the orange groves, the tea orchards, the garb of the attendants will appeal to the aesthetic for beauty and unique originality.

Down the famous coast route from Los Angeles to San Francisco Bay is now a constant succession of delights. In these few hundred miles nature is seen in her most imaginative mood. Here and there white missions stand as silent witnesses to the faith of the Spanish pioneers, adding the romantic touch of antiquity, and sharply contrasting with palatial hotels that speak the last word in modern luxury and comfort.

But perhaps you will choose for your route central California—down the beautiful valley of the San Joaquin River. By taking this route you may spend a day among the gigantic trees of the Mariposa Grove and visit the majestic cliffs and shimmering falls of the Yosemite.

### LOS ANGELES.

The tourist center of Southern California is Los Angeles, 484 miles south of San Francisco. It is no hard task to discover why tourists flock here. The climate is renowned the world over, for Los Angeles has 300 clear

THE SUNSET LIMITED, RUNNING BETWEEN SAN FRANCISCO AND NEW ORLEANS.

days in the year. The scenic region about Los Augeles is one of endless charm.

When you are bound east from Los Angeles, there is a choice visit through the heart of Arizona, which the Southern Pacific has recently made accessible, a journey through the Arizona National Reserve. The main line of the Southern Pacific is left at Maricopa for Phoenix on the Arizona Eastern Railroad, where an automobile is taken for the trip to Globe. The route lies through the

### SALT RIVER VALLEY.

where irrigation has made possible a luxuriant growth of oranges, cotton and dates. The road winds through canyons and among cliffs to a height of 3,470 feet, then leads down to Roosevelt Dam, which is in a gorge at the upper end of Salt River Canyon. The dam has a maximum height of 280 feet, and when the reservoir is full, it will form a vast lake backing up seven miles in the Tonto River and 27 miles in the Salt River. Four and one-half miles east of the dam, a detour of a mile and a climb of 20 minutes bring you to one of the ancient cliff dwellings, and three miles further away, a journey by trail brings one to an even more extensive group. The journey from the dam to Globe is through a country of scenic features, with huge mountains, and from Globe to Bowie, where the Southern Pacific main line is reached again, the way lies through the Gila Valley with its alfalfa and grain fields, its frequent orchards and its tree-lined irrigation canals.

San Antonio, Texas, is sure to attract those who love to revel in history. Many of the old-time adobes are still standing, recalling the days when this was the capital of the Spanish province of Texas.

Our journey over the Southern Pacific rails ends at New Orleans. From here run the steamers of the Southern Pacific to New York City, affording 100 golden hours at sea. But most travelers will wish to linger for a brief time, at least, in New Orleans. This is the unique city where the romantic past and aggressive present meet face to face. As one walks the streets of the bustling city, one catches glimpses of side streets with quaint old buildings that seem to have been taken bodily from some venerable European city. The architecture is of ancient France and Spain. In the "Vieux Carre," or old city, this impression is so strong that one forgets for the time that he is in America. Then there are parks of famous beauty, buildings of keen historic interest, and the wharfs and levees where the countless bales of cotton, sugar barrels and bags of rice tell of a modern New Orleans, which is the outlet for the greatest agricultural region in the world. This city, where past and present meet, and a five days' rest on a luxurious Southern Pacific steamship to New York is a fitting climax to a most delightful journey.—.4dv.

### NEW CANAAN, CONN., SHOW.

The seventh annual exhibition of the New Canaan (Conn.) Garden Club was held on Monday afternoon and evening, June 24. The Show was regarded one of the best ever held by the club. The decorations of the hall gave the impression, as one entered, of a garden. Pergolas, trellises, and garden seats were employed to produce this effect. A great variety of outdoor flowers were on exhibition, the quality of some of which could not have been surpassed. Vegetables were also an interesting feature. judges were: Alexander Goddis, C. H. Totty, and P. W. Popp.

The list of principal prize winners

follows:

### HYBRID TEA ROSES.

Radiance, blue ribbon, Mrs. H. J. Davenport
Mrs. Aaron Ward, blue ribbon, Mrs. Philip
Gossler, red ribbon, Mrs. H. J. Davenpott
Kaiserin Amasta Victoria, blue ribbon,

Strawberries, blue ribbon, Mrs, Art'ur McMullen; red ribbon, Miss Faile,
Small fruits, blue ribbon, Mrs, L. H.

### HORTICULTURAL SOCIETY OF N. Y. SHOW

The above named society held an exhibition in the Museum building. Bronx Park, June 26-27, which was noteworthy on account of the quantity of fine hardy stock displayed. The stock was good, and tastefully arranged. Leading exhibitors were: Bobbink & Atkins, Rutherford, N. J., hardy perennials, polyantha roses, hybrid tea and tea roses, and a collection of delphiniums; William Shillaber, Essex Falls, N. J. (J. P. Sarenson, gardener), hardy rambler roses, including Tausendschon, Dr. W. Van Fleet. Hiawatha. Silver Moon Everblooming, Flower of Fairfield. Lady Gay. Aberie Roabier, Gardenia. Dorothy Perkins and White Dorothy; John Lewis Childs, Flowerfield, N. Y., yellow Calla Elliottiana, and lilies and irises: Mrs. F. A. Constable, Mamaroneck, N. Y. (James Stuart, gardener), vases of hybrid perpetual roses; Mrs. W. G. Nichols, Rye, N. Y. (G. N. Sullivan, gardener), collection of flowers of herbaceous plants: T. A. Havemeyer, Glen Head, N. Y. (A. Labodny, gardener), collection of flowers of shrubs and trees; Mrs. Benjamin Stern, Roslyn, N. Y. (H. Gold, gardener), collection of sweet peas; Adrian Iselin, New Rochelle, N. Y. (Joseph Tiernan, gardener), collection of delphiniums, which were exceptionally fine, also a collection of sweet peas: Mrs. H. Darlington, Mamaroneck, N. Y. (P. W. Popp, gardener), Allamanda Schottii; Lager & Hurrell, Summit. N. J., large plant of Orchid cattleya gigas. A number of prizes were awarded.

# NEWPORT, R. I. SHOW.

The June rose show, under the auspices of the Garden Association, assisted by the Newport Horticultural Society, was held on the Garden Association's new grounds, corner of Old Beach road and Gibbs avenue.

The best collection of named hybrid perpetual roses was awarded to William Waldorf Astor (Hugh Williamson, gardener); the best display arranged for effect went to Robert W. Goelet (Colin Robertson, gardener). For the best collection other than hybrid or tea roses the award was taken by A. F. Fish, New Bedford, Mass. For the best collection of tea and hybrid tea Colonel H. E. Converse (David Ray, gardener), captured the honors. Mrs. William Leeds (William Gray, gardener) was winner of several first prizes in the rose classes

In the strawberry classes for the best dish of Gandy First, Mrs, French Vander-

dish of Nick Ohmer, shown by David Roy, seemed to be the tavorite strawberry.

Under the head of centerpieces, tancy baskets and vases, the fancy basket shown by Mrs. W. W. Sherman (Andrew Ramsay, gardener) took first prize. This basket was round, with a tall handle and was filled with Mrs. Aaron Ward roses and rose foliage with a large bow of orange-yellow ribbon. The basket and roses matched in color and the whole was strikingly handsome and thought well enough of by the judges to award it the American Rose Society's bronze medal.

The best centerpiece was shown by Mrs. W. B. Leeds. The base of this basket was filled with Rhea Reid roses and foliage and had a tall tapering vase in the centre filled likewise. The Rhea Reid rose was shown in several classes and it attracted much attention, arranged both in single and bunches, and was awarded first prize for the best 12 outdoor hybrid tea roses. These were exhibited by Mrs. W. B. Leeds.
In the special awards, the American Rose

Society's bronze medal was awarded to Mrs. William Waldorf Astor, for a splendid exhibition of hybrid perpetual roses. Mrs. W. B. Leeds won the silver medal of the American Rose Society for her exhibit of roses of the hybrid tea varieties.—Am. Florist

### MASSACHUSETTS HORTICULTURAL SOCIETY SHOWS.

The three June exhibitions of the Massachusetts Horticultural Society were all especially good this season. June shows are so dependent on climatic conditions that they are always somewhat uncertain, and postponed exhibitions are not as a rule successes. Otherwise all the exhibitions would have been still better if held a week

On June 5 and 6 there were extensive displays of German Iris, some of the largest contributors being T. C. Thurlow's Sons Co.; Martin Sullivan, gardener to William Whitman; E. N. Dunpke; George Page, gardener to Mrs. Frederick Ayer; and William Thatcher, gardener to Mrs. John L. Gardner; the last named had the best orchid group. Martin Sullivan had the best twelve plants of Canterbury Bells.

Duncan Finlayson, gardener to Larz Anderson, took first prize for twenty-five varicties of herbaceous plants. Cut rhododendrons made a smaller display than usual, the largest collection being from T. D. Hatfield, gardener to Walter Hunnewell, who received a silver medal. Henry Stewart. W. C. Winter and T. C. Thurlow were among the prize winners.

E. H. Wetterlow was awarded a certificate of merit for new pink pelargonium Lady Rosere Mary Pelton. Donald McKenzie, gardener to E. B. Dane, showed some fine Clerodendron Balfourianum. Henry Stewart had some grandly flowered specimens of the old Oncidium flexuosum. He received a certificate of merit for a fine specimen of Cattleya citrina splendidly flowered. F. J. Dolansky had a fine group of Cattleya Mossiae and gigas, also very fine Miltonia vexillaria carrying as many as eleven flowers per stalk. There were numerous exhibits of Aquilegias and other garden flowers.

The display of peonies on June 19 and 20 filled the main exhibition hall, over 10,000 blooms being staged. R. & J. Farquhar & Company received a silver medal for a notable display. F. C. Thurlow's Sons Co. had 2,500 flowers. A. P. Sanders showed 200 varieties. Some other contributors were Martin Sullivan, gardener to William Whit-

milt (Daniel Hays, gardener) was first. Al man; Mrs. J. F. Fleod; William Thatcher. A. H. Fowkes; Mrs. C. S. Minot; Wellesley Nurseries; Blue Hill Nurseries; Eastern Nurseries, and Bay State Nurseries.

Hardy roses were fewer than usual, the date being ten days too early. The principal prize winners for these were Thomas N. Cook (John D. Gordon, gardener); J. D. Christensen, gardener to Mrs. Frederick Ayer and Mrs. N. P. (atter. William Thatcher and Duncan Finlayson had the best Sweet Williams, the last named were for twenty-five vases of berbaceous plants. Martin Sullivan and Donald McKenzie led tor Campanula medium. Mr. McKenzie received a silver medal for a tastefully arranged group of orchids.

For six Gloxinias, William Thatcher received first and Henry Stewart second. There were numerous nursery displays of peonies and hardy herbaceous plants in great variety. In the strawberry classes Marshall once more proved invincible, Golden Gate and Barrymore following in quality. Vegetables were largely shown. For eight varieties J. D. Christensen, gardener to W. J. Clemson, was first.

The Boston Sweet Pea Show will take place on July 9 and 10,

### OYSTER BAY HORTICULTURAL SOCIETY.

The regular monthly meeting of the Oyster Bay Horticultural Society was held on Wednesday, June 23, in Fireman's Hall, Oyster Bay. President Jos. Robinson, presided. Three new members were taken in.

Fifty-eight vases of Flowers, five dishes of Vegetables, three dishes of Fruit were on the exhibition tables, Messrs, Woolson, Robinson and Humphreys were appointed judges and reported as follows:

Judges and reported as follows:

Society's prize for 6 sprays of roses, James Duckham; society's prize for 12 pods of peas. Frank Petroccia; society's prize for 12 strawsceries, Arthur Patten; Howard C. Smith's prize of \$5 tor 12 vases of sweet peas first prize, James Duthie's prize of \$6 for 6 vases of sweet peas sfirst prize, James Duthie's prize of \$6 for 6 vases of sweet peas sfirst prize, Frank Kyle; second prize, C. E. Moyses; vase of climbing roses, by John Sorosick, honorable mention; vase of orchids in variety, by John Ingram, honorable mention; vase of delphinium, by Frank, Kyle, honorable mention.

Mr. H. Gibson made a very interesting

Mr. H. Gibson made a very interesting report on the visit of a delegation of gardeners, from Oyster Bay, to the Ward Estate, at New Rochelle, to see Mr. Butterback's new fruit gardens.

Mr. Woolson and Mr. Duthie also gave humorous talks

It was decided to hold the annual outing in August. Notice of time and place will appear in notice of next meeting

ANDREW R. KENNEDY, Sec.

### CONNECTICUT HORTICULTURAL SOCIETY.

This society held its regular June meeting on Friday evening, June 25, at 8 o'clock, in the County Building, Hartrord. committee in charge of the June Flower Show made its report, stating that they eleared about \$80, all expenses paid, which they have turned over to the Union for Home Work.

Much discussion was indulged in over the question of admitting an outside society into full membership as a branch of the Connecticut Horticultural Society, and it was finally left to the members to think the matter over when they would be better able to present their views, when the matter would be finally turned over to a committee to draw up definite plans for presentation to the society. Messrs. Alfred Dixon, W. W. Hunt and Mrs. William H. Plan for the Color-Glories of late Summer. Nature will supply the golden background for

Palmer were appointed a committee to draw up resolutions regarding the death of the late James J. Goodwin, one of our life members

President Warren S. Mason, superintendent of the Pope Estate at Farmington, had on exhibition a very fine collection of roses, comprising 45 varieties, the most attractive being specimens of Frau Karl Druschki, Ulrich Brunner, Cecile Brunner, Radiance, Margaret Dickson, John Hopper, George Arends and Nova Zembla. President Mason was much pleased with the growth made by this latter rose, stating that in his opinion it was equal to Margaret Dickson and Karl Druschki. Crimson Rambler, Dorothy Perkins, Gardenia, Silver Moon, Tausend-schon, Philadelphia, and Waterbury Ramblers were in the collection of hardy climbing roses. W. W. Hunt, G. H. Hollister and Theodore Standt was named as judges, and they were awarded the exhibit of President Mason, a first-class diploma, and the smaller exhibit of Mr. H. L. Ritson received honorable mention.

Two life and twelve annual members were admitted to the society. Our next meeting will be held in September, the society taking the months of July and August as a vacation.

ALFRED DIXON, Secretary. Wethersfield, Conn., June 28, 1915.

### PATERSON FLORICULTURAL SOCIETY.

At our June meeting the following awards were made:

For the best display, first prize, Riverlawn Gardens, Robt. Petree, gdr., display of Iris; second prize, Wm. Parker, display of H. P. Roses; third prize, Jas. Schofield, display of H. T. Roses.

For cultural points: first award, Jas. Schofield; second award, Wm. Parker; third award, Riverlawn Gardens.

Honorable mention: Benjamin Bentele, Marion T. Probert. Robt. P. Baggaley.

S. HUBSCHMITT, JR., Sec.

# MADISON (N. J.) ROSE SHOW.

The rose show held at Madison, N. J., on June 17 was a great success. There were no money prizes offered but nevertueless the gardeners responded freely. There were some fine exhibits and competition was close. Arthur Herrington gave an illustrated lecture in the evening on the rose, which was greatly appreciated.

The chief exhibitors were William Duck-ham, David Francis, Robert Francis, Ernest

Wild, Robert Tyson, L. A. Lockwood, Chas. Barbour, C. H. Stout. Robert Tyson—Cultural certificates for garden peas and two bunches greenhouse

A. Lockwood, certificate for 12 peonies. Mrs. Wm. P. Jenks was awarded the society's silver medal for two magnificent standard fuchsias.

Mrs. C. H. Stout received a certificate award for three special vases sweet peas.

Mrs. T. E. Lowe, vases of fine roses, awarded a certificate.

Edw. Reagan, cultural certificate for Canterbury bells, delphinium and anchusa.

Robert D. Foote, certificate of merit for a grand specimen with over 70 open flowers

of cattleya gigas Sanderiana.
P. D. Witing, certificate for sweet peas. C. H. Totty certificate for three vases

The best vase of roses in the show, according to the judges, was that of W. R.

Smith, shown by David Francis, superintendent to Charles Bradley of Convent. Delphiniums of Robert Francis, superintendent to W. V. S. Thorne of Normandie Park, were the best ever seen in this vicinity.—Record.

### TARRYTOWN (N. Y.) SHOW.

The annual June exhibition of the Tarry town Horticultural Society was held in the gymnasium of the Young Men's Christian Association Building June 16. The show was larger and finer than last year's. was free to the public, and was open from 2 o'clock in the afternoon until 10 o'clock in the evening.

All of the exhibits were of very fine quality. There was keen competition in the classes for school children, which classes were very interesting.

A silver medal was awarded the F. R. Pierson Company for a vase of Ophelia roses and a cultural certificate for Francis Scott Key roses, and an exhibit of a fine collec-

tion of climbing roses, etc.

Dr. C. C. Brace exhibited a beautiful collection of campanulas, for which he was awarded a special prize. Special prizes were also awarded to Col. Jacob Ruppert for a fine display of dianthus and to Mrs. W. G. Nichols for seedling carnation. Col. Franklin Brandreth exhibited a very fine lot of hybrid tea roses, for which he was awarded a cultural certificate. A cultural certificate was awarded also to Charles H. Tibbits for a fine display of pansies. Mrs. John D. Archbold exhibited a fine vase of Canterbury bells and yellow antirrhinums, for which she was given honorable mention. Mrs. J. B. Trevor exhibited a seedling dracena, receiving honorable mention.

The judges were James Stuart, Mamaroneck, N. Y.; Joseph Mooney, Hastings, N.

Y., and W. H. Harvey, Ossining.

Y., and W. H. Harvey, Ossining.

The collection twelve varieties of vegetables are collection twelve varieties of vegetables. C. C. Brace, Best collection twelve varieties of vegetables—1st prize, Mrs. J. B. Trevor; 2d prize, Miss Blanche Potter. Special prize awarded to Col. Jacob Empert (Frank T. Reid, gardener) for collection of

Blanche Potter.
Special prize awarded to Col. Jacob Ruppert (Frank T. Reid. gardener) for collection of dianthus.

GREENWICH (CONN.) SHOW.

The annual summer exhibition of the Westchester (N. Y.) and Fairfield (Conn., Horticultural Society was held in the Town Hall, Greenwich, Conn., June 18 and 19. The quality of the exhibits was of marked superiority throughout, and the 55 classes embraced in the schedule were all well filled. Competition was very keen. Special features were the trade displays of the George E. Baldwin Co., orchid specialists of Mamaroneck, N. Y., who received a C. M.

for a fine table of orchid plants in bloom? consisting of choice and rare sorts. Scott Bros., of Elmstord, N. Y., received a C. M. for a fine display of roses and perennials. Honorable mention was accorded to the J. H. Troy Nurseries, of New Rochelle, N. Y., for display of h. t. roses; also to the A. N. Pierson, Inc., for display of novelties in h. t. and rambler roses. Six decorated dinner tables were in evidence, all good and all tastefully arranged. First prize went to Mrs. W. M. Bennet, Greenwich. Conn.; second, Fred Lagerstam, Greenwich, third, G. D. Sullivan, gardener to Mrs. Wm. Nichols, Ryc. N. Y. Miss F. L. Burgevin, Port Chester, N. Y., received H. M. The same honor went to Walter J. Deck, of the Millbank Greenhouses, Greenwich.

The special prize for moss roses was again won by P. W. Popp, gardener for Mrs. H. Darlington, Mamaroneck, who also won first for basket of sweet peas. The chief award for a vase of sweet peas went to Fred Lagerstam. A. C. M. was awarded to Rob ert Williamson for a table display of foliage plants; and C. M. to Robt. Allen for group of orchids and foliage plants.

It is gratifying to note the increasing interest taken in these exhibitions by the true amateurs-those who do not employ professional help. The classes provided for this section were all well filled and some really good exhibits were in evidence.

The judges were Messrs, John Everett,

Glen Cove, L. I.; William Jamieson, Tarrytown, N. Y., and Martin O'Brien, Mt. Kisco. N. Y., whose decisions were received with satisfaction.

satisfaction.

The principal winners in the cut rose section were: E. C. Benedict, Greenwich (Robert Allen, gardener); G. D. Barron, Rye (Jas. Linane); Mrs. Wm. G. Nichols, Rye (G. D. Sullivan); Mrs. H. Darlington, Mamaroneck; Moses Taylor, Mt. Kisco (Mex. Thompson); Mrs. A. P. Stokes, Noroton, Conn. (A. White law); Mrs. F. A. Constable, Mamaroneck (Jas. Stuart); Robt, Mallory (Port Chester (Wm. Smith); Chas. Mallory (W. J. Sealey); Henry R. Mallory (Patrick Fairfield); Wm. Shillaber, Essex Falls, N. J. (J. P. Sorenson); C. T. Wills, Greenwich (Martin Glendon); Mrs. H. Shosmaker, Riverside, Coun. (Jas. E. Welcher).

For hardy flowers, 18 kinds, 1st, Mrs. F. A. Constable; 2nd, Mrs. Wm. G. Nichols; 3rd, Mrs. L. C. Bernee (John Andrew). For 9 distinct, 1st, Robt. Williamson; 2nd, Mrs. Arnold Schlact, Saugatuck, Conn. (Ed. Lawrence), 3rd, Mrs. Henry Schaeffer, Greenwich (Jacob Stumpp).

# GLEN COVE (N. Y.) SHOW.

The annual Rose Show of the Nassau County Horticultural Society was held at the Nassau Country Club, Thursday, June 10. A very fine display of Hybrid Tea and Tea Roses was staged, but exhibits in other classes were smaller than usual owing to the lateness of the season.

The following were the successful exhibitors in the different classes:

Collection of outdoor roses-first, Mrs. H

II. L. Pratt; second, Mrs. C. F. Cartledge, Visco of cut flow (1112 free of shrub) first, Mrs. II. I. Pratt; second, Mrs. II. L. Pratt; second, Table decoration first, Mrs. II. L. Pratt; second, II. S. Ladew. The judges were George Ashworth, William Robertson and Angus McGregor. JAMES GLADSTONE, Cor. Sec.

### LAKE GENEVA (WIS.) SHOW.

The annual peony show of the Lake Geneva Gardeners' and Foremen's Association was held in Horticultural Hall, Lake Geneva, Wis., on June 19, 1915. Owing to the weather the show had been postponed for one week, but the exhibition proved a great success and was well patronized by the public. A fine collection of flowers and vegetables was brought together, reflecting great credit on the Lake Geneva gardeners.

The list of prizes follows:
C. L. Hutchinson, Wm. Longland, gardener;
3 pink 1st, 6 pink 2nd, 3 white 3rd,
Mrs. T. J. Lefens, Raymond Niles, gardener;
6 red 2nd, 3 pink 3rd, carrots and cabbage 1st,
beets, asparagus, radish 2nd, cauliflower, peas,
onions and turnips 3rd, strawberries 2nd,
Mrs. Conrad Scime Faul Lobneson, gardener;

atuneus 1st,
E. E. Ayer, Henry Tolman, gardener; peas
1st, cauliflower, beets, lettuce 1st, strawberries
1st, pansies 1st; aqualegia 1st,
J. H. Moore, A. Martini, gardener; hardy
roses 1st, celery 1st, peaches 1st and certificate
of merit, group of plants and flowers 1st.

### EDIBLE FLOWERBULBS.

By JOHN SCHLEPERS.

During the past winter the authorities in Holland have been testing the mixing of flour, made from tulips, with rye-meal, in order to use the product so produced for the making of bread.

It is perhaps apropos to remind interested readers of the fact, that bulbs of various liliacaea make a nourishing food for the native races of many localities. All the allium varieties are also generally caten.

Lilium, fritillaria, calochortus, tulipa, erythronium, ornithogalum, camassia, all are used for food, especially lilium and camassia, being the most important of them all.

The bulb-scales of various lilies are being eaten in Siberia, China and Japan.

Camassia excellenta lindl grows in Western America; these bulbs are eaten by the native races of the Pacific States of North America, from British Columbia to Mexico.

"Camass." or "Quamash," is even in the dry coast section of Northern California, the principal plant-food of the natives, Cakes are made of camassia bulbs; they are roasted in an oven, under the ground, with the use of heated stones, coming out of the oven in a sticky, dark colored mass, and are then kneaded into cakes and rolls, which are allowed to dry in the sun and are often kept for years, before being consumed.

Liliacaea bulbs contain a great percentage of "carbon hydrates," and are therefore considered a splendid food product. They, however, often contain also poison. The tulip, for instance, contains in her fresh bulb a poison, that seems to belong amongst the "alkaloids," but which has not yet been very thoroughly chemically examined.

Amaryllidaea seem to contain still stronger poison, though of some varieties the bulbs are eaten. Of course the preparation, cooking, or roasting, may result in the poisonous properties largely disappearing.

It is a question if all such food is very palatable.

Mice show a preference, declining to touch tulip bulbs, nor do they care for camassia bulbs.

The omnivorous garden snail, "agriolimax agrestis," may eat sliced tulip bulbs, when offered, but greedily devours, in comparison, other tissues containing some similar properties, for instance, potato roots.

I believe that tulip bulbs have been fed to pigs with appreciable results.

In so far as making bulbs palatable to the people at large is concerned, this will, to a considerable degree, depend upon the preparation.

In connection with this we must not lose sight of the fact that the natives in Western America eat nearly everything that the land affords in roots and berries, etc., however distasteful many of those things may be to the white man.

It is a historical fact that as early as the fifteenth Century

tulip bulbs were used as foood.
"('lusius'' speaks about tulip bulbs making good food; in 1592 he ordered a quantity to be preserved (candied), and considered this delicatesse far superior to orchid bulbs prepared in the

### THE CLEVELAND FLOWER SHOW.

Coliseum-November 10 to 14, 1915 Executive Office-356 Leader Building

Cleveland, Ohio, July 8, 1915.

Mr. M. C. Ebel, Secretary,

The National Association of Gardeners, Madison, V. J.: Dear Sir. -Will you please inform the members of your Association that the premiums' committee of the Clercland Flower Show has decided to add a special premium to many of the important classes and sweepstakes, as it will appear in the final premium list which will be mailed September 1.

This special prize will be a five dollar gold piece, given to the section man in charge of the beach or section from which winners of last prices were grown. Our committee decided to issue these special prizes as an inducement to the man behind the hose. It is our opinion that it will make the work of the judges not an easy matter in the selection of prize winners.

We will be glad to hear from nour members who did not receive a copy of our preliminary list, so as to make sure they will receive a copy of our final list.

Yours for a big Cleveland Flower Show, HERBERT BATE,

Chairman, Premiums Committee.

# RIDGEWOOD (N. J.) SHOW.

The first annual flower show of the Ridgewood (N. J.) Garden Club was a success, both in the variety of the display as well as the beauty of the flowers and tastefulness of their arrangement, and was a credit to President Roe, C. L. Lersner, chairman of the Show Committee, and the other members.

The large piazza of the Walker home was charmingly decorated with crimson ramblerand forest green, and the exhibits were displayed on tables covered with green crepe paper. There were twelve exhibits of fruits and vegetables.

F. II. Valentine's strawberries (Chesa peake) were particularly large and wellformed berries, and he took the first prizfor fruits.

For vegetables, E. T. Sowter took first prize, and William G. Daub was the winner of the second prize.

The display of flowers was particularly fine, and the basket of Dorothy Perkins roses and gyp-ophila, with sprays of dark blue delphinium shown by A. D. Rowley, attracted much attention. The roses of George E. Henry and E. F. Keller also deserve special mention.

E. T. Sowter had a fine collection of sixteen or seventeen varieties of flowers, many of them grown from seed, including campanulas, pansies, gaillardia, antirrhinum, delphinium, digitalis, iris, stocks, etc. An interesting feature of this exhibit was, that where grown from seed the date of sowing was given.

F. H. Valentine had a most artistic exhibit of about twenty general varieties, considerable skill and excellent taste in the color scherae and arrangement being shown Henry

There were seventeen entries of flowers, other exhibitors being Wesley Van Emburgh with a number of varieties including peonies, dablias, roses, sweet peas and a lemon tree in full bloom; C. Wadsworth with a fine show of roses and a particularly large deep red dahlia; H. S. Vincent, whose delphiniums, larkspurs and antirrhinums were very attractive; R. L. Roe, with admirable deep purple iris, and Wilson Moneypenny, who showed campanulas, Sweet William and other perennials.

A striking exhibit was by William J. Me-Quaid, whose massed effect of correspsis and gaillardia was very effective.

The contest in the flower class was so close that the judges, Mrs. D. A. Garber, Mrs. E. F. Thomas and Mrs. C. W. Stockton, had difficulty in coming to a decision. They finally, however, awarded first prize to E. T. Sowter; second prize to George E.

# **Greenhouse Experiment** What Not To Do!

N building a greenhouse which involves a definite outlay of money, no owner can afford to place his operation in the hands of any contractor as an experiment.

We know what to do and what not to do. And the owners who realize this fact employ us. Forty-four years at greenhouse construction has made us experts.

Put your greenhouse problems up to us.

We go anywhere in the U.S.A. to submit plans and specifications.

# METROPOLITAN MATERIAL CO. Greenhouse Builders

1396-1412 METROPOLITAN AVENUE, BROOKLYN, N. Y.

There are over 10 miles of our own railroad. In going over to the western tract that day, one of our friends rode in the engine cab, while the other two of us sat on the water tank on each side of the boiler, where we could plainly see everything there was to see.

From the top of the crag, this posit. The bed they were wo

# A Little Jour

T happened on the fourteenth of June.

There were three of us.

The Little Journey was to be one of convincement. Luckily one of us brought a camera along so we can now show you a few of the things we saw.

We started from the factory, where the natural humus is converted into Alphano, and took our private railway across to the western tract, two miles or more away. The humus deposit here averages 6 feet deep. To get an idea of the real magnitude of the proposition, we climbed up on top of a rocky crag and got a bird's-eye view of one strip over half a mile long, that was being worked.

From here we looked down on the big electric digger which removes the natural crop producing humus and beating it up in fine pieces, scatters it for hundreds of feet, where it lies until cured by the sun and air.

In further parts of the field, electrically driven scrapers were piling the fertile sweetened humus up along the railroad track; and gangs of men shoveling it into the cars.

Long strings of these humus-laden cars were constantly

crossing the field on their way to the big compost piles, whit will stay for months, fermenting and multiplying by millions, the bacteria of ferment, which is absolutely necessate any soil's fertility.

Next we walked back leisurely to the factory, where the natural humus is concentrated and made into Alphano. At a bottom of the compost pile, where the natural humus is old and thoroughly bacterized, a big travelling screw conveys to the huge steel drying drums.

Here we peeked into the drums and saw the heavy mo ture laden natural humus come in at one end, and pass out the other in its dry, finely granulated condition. 75 or 80 of the moisture is entirely driven from it. Several tons of t natural humus make but one ton of the concentrated humus. say it another way—if you buy a ton of the usual, so call Natural Humus, you pay for about 1500 pounds of water

From the drying drums, endless chain buckets take the cocentrated humus up to the mixing room. It was about the mixing room that our two friends seemed the most curious.

But when they saw the rich, concentrated available pla

There are still acres and ac es of the rich leaf mold deposit that we have not yet cleared of its tropical-like tangle. In going through here on our railroad, you would almost declare you were in a Panama forest.

# Alphano 17-G Battery

There are two immense compost piles. This was taken, it contained between 30 and 40 th that several estates on Long Island alone, b need two such piles.

se we saw of the western dea mile long and 6 feet deep.

# To Alphano

ds and bacterial nutrients of highest fertilizing value being led in liberal quantities, they began to see what a distinct inction there is between so called "natural", or raw, waterged, sour humus; and our sweetened, composted, concented dry Alphano, with its rich plant food contents.

They began to see why it is that Alphano puts such quans of immeditely available foods in the soil; and continues

ontribute to its fertility for years to come.

They began to appreciate that the millions of bacteria it

in the soil, must have time to multiply, so they can vigorly attack the soil and liberate the locked up foods it naturcontains. This fact explained to their entire satisfaction Alphano results are so often better the second year than

Next came a look at acres and acres of Alphano grown ry; an Alphano lawn; Rhododendrons and shrubs planted Alphano; fruit trees that were set out with it this spring; vers that were revelling in it. Then it was that our skeptical

nds cranked up their car and went away thoroughly self-conted. Unless all signs fail, they are Alphano converts for life.

Just to prove to my friends that even in its natural state, this humus makes the finest kind of growing soil, I showed them this patch of celery a quarter of a mile long. It was then the fourteenth of June and the men were boarding it for bleaching. On the 26th, we shipped a carload to New York, of the finest early celery you ever set teeth in.

And right now I want to say that a most cordial invitation is extended to you and your friends to come and visit this wonderful natural deposit; and see the highly interesting process of converting it into Alphano. Drop us a card that you would like to go; and I'll try and arrange a day when several of us can go together and make a jolly party of it.

Mr. Ebel, the Editor of the CHRONICLE, recently paid us the compliment of such a visit. The heads of several of the State Experiment Stations are making frequent visits for the benefit of their stations. The government itself, is carrying on extensive experiments on numerous test and trial plots, which they are continually visiting, and checking up the results. So you see it's now high time you came to see us.

MARK

back of the factory. When the photograph t sounds like a lot, but when you consider and more tons apiece, you can see why we

We were several years perfecting this big, powerful, electrically operated machine. It first digs the humus up; then beats it into fine pieces; and scatters it over wide areas to sweeten with the action of sun and air before it is scraped up, loaded on the cars and taken to the compost pile.

# A BIRD BATH OF SHARONWARE

the birds, give them plenty of fresh water for bathing and drinking. Where water is not naturally abundant, a bird bath, such as the one illustrated, should be used. It empties

itself every 24 hours, thereby making it sanitary. This bath is so constructed that the birds may both in water from an eighth of an inch to two it ches deep. It is 17 melies in diameter, 6 inches high and weighs 30 H. It is deconative, artistic and practical, and can be secured in various colors. Price, \$3.50, F. O. B. New York. Crating charge on out-of-town orders, 30 cents extra, Sharonware, the new frost-proof cement garden furnishings, window boxes, jardiniers, flower pots, bird baths, garden seats, etc.

# BAILEY'S New Standard Cyclopedia of Horticulture

Everything Newly Written-Up to Date-Beautifully Illustrated

THE new Standard Cyclopedia of Horticulture has been freshly written in the light of the most recent research and experience. It is not merely an ordinary revision or corrected edition of the old Cyclopedia, but it is a new work from start to finish with enlarged boundaries geographically and practically; it supersedes and displaces all previous editions or reprints of every kind whatsoever.

It is the fullest, the newest, the most authoritative of all works of its kind and constitutes the most conscientious attempt that has ever been made to compress the whole story of our horticultural thought, learning and achievement into one set of books.

# Things and Thoughts of the Garden

By The Onlooker

I cannot get away from them -they crowd in upon my mind, those Sweet Peas of Newport. There is only one Newport when Sweet Peas are spoken of. But the gallant men of Rhode Island's fashionable watering place were snowed under, or snuffed out or fogged out, which? No need to ask the Newportians; they would shout like thunder, "It was the fog." Even on the eve of the exhibition, which took place July 15 and 16, the streets around the harbor were dim and misty as the penetrating chilly curtain of vapor, ghost-like, stole in and around the street corners. That such superlative Sweet Peas were produced under these very trying conditions was greatly to the credit of the local growers. They were beaten by the men of Lenox, but with honor.

Giant strides have been made in two short seasons. It may be safe to say that in 1913 the Sweet Peas at our exhibitions were what would have been considered second rate among the growers of the inner circles of the Sweet Pea cult in England. Today we can load the tables with blooms of the highest quality, on stems 16 in., 17 in., 18 in. long, bearing threes and fours every time, blooms big, heavy, bright and clear in color, unblemished by the weather or by insects, something to look at and admire, which make we lesser combatants of the ring stand in awe of. Hurrah, then, for Jenkins, and if, in some garden at present unknown, an equally unknown combatant sits planning and dreaming of high and mighty conquests, not upon fields of battle, but in the pleasant exhibition halls, and if in the not far distant future he comes forth and triumphs over the redoubtables of today, they and all of us will laud and welcome him, for healthful competition and the zest that accompanies striving, would decline and pass away but for the "new man," the black horse of the race, the runner up in the game.

This Sweet Pea showing, what is it? "I'm not a Sweet Pea crank yet," said a friend to me at Newport on the morning of the exhibition, and but for the fact that he was certainly a more capable and ardent gardener in many other lines, I would have had to feel pity for him. We cannot all raise a love for a given flower, even for such a truly charming one as our dainty Sweet Pea. Rather fancy, too, he had a soft spot in his heart for Roses and Gardenias, not to mention his house of Cattleyas in superb condition, and a collection of Adiantum Farleyense, which the present writer has never seen equalled in point of health, symmetry and general beauty. Each plant was a beautiful specimen, some in big pots, some in little ones, the big ones raised well above the

stage, which was covered with sphagnum and kept damp, the lesser ones on the stage. Yes, let us each have some choice specialty; one can hardly make a "specialty" of everything, and indeed specialism obviously implies concentration. One man cultivates Chrysanthemums, or Carnations, or Roses, or Phalænopsis, or Grapes, or vegetables better than his neighbors, and once he earns fame in some one direction he does not relish being beaten. So the standard of cultivation is upheld. One man's achievements point the way for others and exhibit the possibilities of the particular subject in which he excels. Until Roland grew his huge Acacias and exhibited them, it is safe to say that few among us valued them or appreciated their merits sufficiently. Have Bieschke's Hydrangeas (Hortensis type) not shown us just what this noble plant is capable of? A dozen other things might be mentioned a crop of Grapes, a plot of vegetables, a superb Amaryllis, a group of Callas, a table of Primulas, a pot of Easter Lilies with sixteen flowers on one stem, giant Mignonette or spikes of double Stocks better than any other body's—these are the things that inspire and please us, and make floriculture the art it is. Therefore, health and power to the specialist.

Our specialist, however, would not be a worthy gardener were he to neglect the other sections of his charge. It depends on the man himself. Some men do neglect other parts of the garden or other plants in their eagerness to attend to every detail of one or two pet things. Not a great many do this, and I make bold to say that no gardener would pursue the cultivation of a given subject against the wishes, or without the encouragement in some degree, of the owner of the garden or the person or family to whose pleasure and economy he administers. The fact is a gardener usually begins in a quiet way on a specialty for any one of a dozen reasons. His success leads him on. In the meantime, the garden owner takes notice of his work, nine times out of ten enjoys the results, enters into the spirit of it, encourages it, and if exhibiting is the climax, shall we doubt that he or she does not feel pleasure in being a winner? (Happily the names of non-winners need not be disclosed.) That is where the gardener suits himself as to what his specialty shall be. But if the owner is not only a patron of gardening. but is also the "boss," knowing plants, their needs, their ways, their merits, and having decided tastes, such a one will choose the specialty and say what it will be. This is right and proper. If the gardener objects, hangs back, makes a botch of what it is desired should be specially well attended to there can only be one solution in the

CHIN Y

long run. Of course, if a man tries and honestly fails, that's another matter, and we gardeners all know the innumerable difficulties that bestrew our path at times, be we ever so willing. Yet, "if at first you don't succeed," perhaps you will the next time. Anyway, you'd better!

But to hark back to Sweet Peas. What would you call the one best variety of the year? My own choice is Royal Purple. It is a fine bold flower of graceful build, comes quite true, no rogues so far as I have seen, and the color is so distinct and pleasing. After this, what's the next? If the choice were based on Newport's show, the award would fall on Burpee's New Vermilion Flake, a bright, highly attractive rosy flaked variety, very captivating. One hopes it is a good doer and vigorous. Florence Hinton proved to be the gem of whites. Where was King White? Has it fallen down this year? Some folks cannot get it to grow, and certainly it has not been a shining star in the writer's own small collection. Loyalty was very finely shown all through, while Robert Sydenham (orange) made many friends, and will be greatly in demand another year. Illuminator, too, was one of the best of the carmines. Of the cream varieties there were good bunches of Dobbie's Cream, Clara Curtis, Isabel Malcolm and Primrose Spencer, with little to chose between them. Jessie Cuthbertson is seemingly the leading red flaked variety, leaving America behind, although the latter has brighter red stripes and is the fancier flower of the two. Lady Evelyn Eyre is the finest light blush pink. Mrs. C. W. Breadmore, Elfrida Pearson, Mrs. Routzahn, New Margaret Madison, Rosabelle, Hercules, Nubian, Scarlet Emperor, Mrs. Hugh Dickson and Mrs. Cuthbertson were also among the first varieties on view. Burpee's Fiery Cross (scarlet) won the silver medal this year, while the same firm had certificates for President (crimson) and Cherub (cream and pink), two excellent flowers.

Whether Sweet Peas in tubs will be as successful in a hot, dry year as they have been this year, which has been notably cool and showery, is scarcely to be expected, but many small growers will assuredly be testing their skill another year with this form of cultivation. For setting about on terraces or other prominent places these pyramids of bloom are decidedly effective and beautiful. The competition was good, and there were many specimen tubfuls on view. The plants were raised in 5-in, pots and set out in April in the tubs, which were about 20 in, wide and rather deeper. Cow manure to a depth of half a foot was packed in the bottom and a good loamy compost used. Tall birch branches were employed for supports.

Lately I have been taking an interest in the Pinks. They are a fine family of plants if we include the Alpine species that are so adaptable for the rock garden, such as superbus, cæsius and glacialis. These ought to be made use of far more. Then there are the Cushion or Grass Pinks, otherwise called Scotch, Hardy, Everblooming or Pheasants'-eve Pinks. These are all varieties. whether they be double-flowered or single, of Dianthus plumarius. This is the parent of all the Pinks (but not the Carnations, which also sometimes go by the common name of Pinks. In Scotland, and in the hands of several English nurserymen, these hardy Pinks have been much improved and are great favorites. They are among the easiest plants to succeed with, given a fairly heavy soil that retains moisture, but not stagnant moisture. They are propagated either, by layers or pipings, the layers being taken now (August), the pipings (or cuttings) in April. While the singles make a bright show and are very free, it is the

improved double varieties either in the white or "laced" forms that deserve most attention. In the latter the red coloring is in zones and as edgings upon the petals. The flowers are full, fragrant, with serrated or fringed edges, and freely produced on stems 1 ft. high or so. Seedlings can also be raised, but for named varieties the layers are relied upon. A perpetual flowering strain has been added during recent years, and for forming an edging line to the hardy border they are greatly in favor with many good flower gardeners. In addition to these true perennial Pinks there are the varieties of the China or Indian Pink (Dianthus Chinensis). In milder localities such as near the sea or in light soils in sheltered positions, some of these linger through the winter, especially if protected a little with dry straw or leaves, and may, and often do, produce a blaze of color the succeeding summer. There is, of course, the variety latifolius atrococcineus, with much fringed, fiery scarlet flowers of large size, which is looked upon as quite hardy and lasting two or more seasons, but it seems to me to be simply a form of China Pink. The majority of the varieties of D. Chinesis, at any rate, are best treated as annuals by being sown in a warm greenhouse in pans in February, the seedlings pricked off into boxes, 4 inches deep, and brought along in a frame or cool house, safe from frost, until it is time to bed them out in colonies, in a sunny spot, in May or June-May preferably. They begin to bloom early in July or before and are among the gayest of summer The Marguerite Carnations can be treated likewise and will flower at the end of July and continue for the remainder of the summer. A good strain will produce 75 per cent, of excellent double flowers from seed. They can be lifted in fall and be potted for flowering in the greenhouse.

3,4 3,4 3,5

It will be interesting to observe whether Mr. Smith, in his list of plants suitable for the rock garden, will mention any or many of the Oxalises. The thought occurred to me when I saw several trials of them at the Fordhook Farms of W. Atlee Burpee & Co., that here were plants that could quite well be made use of for this part of the garden. True, we have Oxalis enneaphylla, the pretty glaucous leaved species, as one of the favorites now, but speaking generally the genus has not had a large place in the rock-garden. There is no reason surely, why nice masses of such kinds as floribunda, rosea, rosea delicata, valdiviensis, and others of the herbaceous or annual types could not be sown and flowered in prepared positions, or here and there in pockets. As a rule there are plenty of spaces that require filling. They are dwarf, grow freely with a modicum of care, bloom well over a long period in midsummer, and would occupy somewhat the same position here that the mossy Saxifragas do in European rock-gardens. Any evidence to the contrary will be only less welcome to evidence supporting my views.

Most of the Oxalises come from dry-land countries, as Mexico, Chili, South Africa and Malta.

\* : :

Reference to Mexico brings to mind the fact that all of it is not dry. This is the native land of our popular cultivated Dahlias. There they grow rank and tall, usually in cool semi-shaded places, or positions screened from the burning midday sun, and with their roots in moist, very freely drained soil. The evolution of the double Dahlias, the cactus varieties, pompons, Peonyflowered collarettes and other types from the species D. variabilies and D. Jaurezii is an interesting story. By the way, the cutting down of Dahlia stems has not been necessary this year, although it was done as a matter of course by some growers. The object of such cutting back

is to have fresh flowering growth for the cooler days of September, when Dahlias are most expected and in request. Why is it that the neat-growing pompon-cactus or miniature cactus varieties are so entirely neglected? They are the ideal for floral work and for the smaller gardens.

Visits to gardens in various Atlantic States recently has impressed upon me the richness and wealth of material we have at our disposal for summer effect. There is no reason why American gardens ought not to be resplendent from May until November. Bull's, roses, perennials, annuals, greenhouse stock that can be bedded out, shrubs, climbers in very great variety, hardy ferns, alpines—all these combine and add to the resplendency. But there is something left unmentioned which calls for more care, or as much care, as any of these, and that is the lawn. The lawn in America is one of the especial tests of a gardener's patience and resourcefulness. Weeding, watering, mowing, rolling, sweeping, top dressing with rich soil—these are among the operations that demand attention in turn, the watering and the mowing very regularly in any of our ordinary summers.

### ROCK GARDENS AND ROCKERIES.

By Arthur Smith, Pennsylvania, (Continued from July Number.)

In planting, it should be the aim to get the rockery full of life as soon as possible, allowing sufficient room for the plants to spread. Practically all alpines thrive best when growing close together, although as some spread more than others they require more room; the *Dryas octopetala*, for instance, which is found both on the Swiss Alps and the mountain of New England, has, for alpines, rampant trailers when it does well. There are two other species of Dryas, native of alpine America, *drammondi* and *integrifolia*, neither of which have such a trailing habit as *octopetala*, but the latter is considered most beautiful.

After planting, the bare soil around the plants should be covered with stones or pieces of rock to keep the ground cool while the plants are establishing themselves. Growing alpines require perhaps, even more of that patience which one must have in all horticultural matters. Some species may take several years to become established, so one must not throw a plant out because it does not thrive immediately, for so long as there is life there is hope.

In connection with the plants to use, one can seek to have as large a collection of species as possible; to create as it were a museum. This method is very interesting and one which has been adopted, for instance, at the famous rock garden at Wisely, England. The main object of the latter is of course botanical and educational, and for the studying out of methods for the successful cultivation of those alpines which hitherto have been difficult to get to thrive, or which have positively refused to grow at all in captivity.

From an aesthetic point of view, however, fewer species and the massing of a number of the same species together, is better than single specimens.

As regards the selection of species, nurseries in this country have hitherto made no attempt at the cultivation of alpines. It is true that in some lists of hardy plants a few are designated as being "suitable for rockeries," but these, with one or two exceptions, are not true alpines and the majority of them will thrive also in the situations that hardy plants are generally planted.

Where one has a naturally rocky place that requires

beautifying much can be done with these "suitable" plants, as most of them enjoy the coolness to their roots which the presence of rocks near them give. For this latter reason the native hardy ferns can be used for this purpose, of which there are many species that, given a rich, cool soil, will do well in full sun.

While there are, as before mentioned, some species of alpines that dely all attempts at growing them, the majority can be successfully made to thrive. The greatest trouble is with our winters. In their native homes the seasons create two distinct conditions, a summer of three months, and a dormant period for the remainder of the year during which they are continually covered with a mantle of dry snow. Alpines are never killed by cold winters but by wet ones. As was noted in a previous issue of the Chronicle, effects of rain and moist atmosphere during the dormant period may be prevented by covering them with sheets of glass. Some erect a glass house over their alpines, which is so constructed that it can be taken apart and stored away each summer. At the above mentioned Wisely a permanent structure has been placed over the more delicate species, but this would obviously be out of place and unsightly in a private garden.

One of the secrets of success with many alpines is to give them an annual top dressing or "earthing up" with compost and at the same time pegging the branches down. They are constantly being subjected to the same kind of treatment by nature, for in spring the melting snow carries down earth, grit and stones on to them. Species having a growth like Daphne, Iberis and Alyssum, to give instances of plants well known, especially require this treatment. Some may be unaware that these species are true alpines, as they are common to our hardy borders. But it is within the experience of most people that in that position they become in a few years "leggy" if they do not actually die out. This is caused by their habit of growing out of the soil, which they no doubt have in consequence of having become used to the natural topdressing given them by the melting of their own mountain snows. They have learned that if they did not rise up they would be buried under the annual deposit.

To give a mere list of alpines that have been successfully grown would be meaningless and useless for all practical purposes, unless accompanied by detailed descriptions and requirements. This would obviously take up more space than can be allowed for in an ordinary article.

Perhaps the most interesting and instructive method of working up a collection of alpines is to go to the mountains and collect them oneself. There would also be in this course the distinct advantage of seeing something of their natural habitat. If possible, seed should be gathered as well, as there are some which, while they do not take kindly to removal, may be successfully grown from seed.

In these cursory notes the subject has been by no means exhausted, but it is hoped that sufficient has been stated to be of some assistance to those who have had no opportunity of gaining experience in this branch of gardening.

While it is perhaps unnecessary, it may be as well to mention that the word "alpine" as used here, does not designate plants which only grow upon the Alps. Alpine conditions exist more or less all over the world, from mountains that rise out of tropical plains and on towards the regions of perpetual ice. In the latter alpines are found at sea level.

# The Busch Gardens, Pasadena, Cal.

By Robert G. Fraser, California

The construction of the Pusch Gardens was begun November 30, 1904; the first work done, because of the necessity to get grading started, being the removal of boulders and brush and the forming of trails to get the teams on to the ground. In many places fills had to be made from six to fifty feet in depth, the earth being taken principally from what is now known as the Sunken Gardens, the dugouts being as low as a hundred feet at times. The condition of the ground was such that dynamiting had to be resorted to frequently in grading. The work of grading was largely done by teams, with Fresno Scrapers. The heaviest work was done in the Upper Gardens, the acreage of which comprises about forty acres.

The Lower Gardens, which cover about thirty acres, were also graded at heavy expense, although this expense was not nearly as great as in the Upper Gardens. This portion of the park is built along natural lines. Here are a great many live oaks which assist in carrying out the effect desired. The shape of the Lower Garden is much like an amphitheatre. It is staged with an artificial lake which covers about an acre of land, and canvons made from a higher elevation serve to convey the water, suggestive of a natural source of water supply; many winding trails lead among the live oaks to resting places, such as arbors and summer houses; about ten acres have been set to lawns kept in a condition suggestive of rural swards. The Lower Gardens abound in animal life: turkeys, pheasants, peacocks, chickens, pigeons; slicep, rabbits and ground hogs which are a constant source of delight to children. Here, also, are groups representing different stories from the Grimm's Fairy Tales. These were sent especially from Germany by Mrs. Busch for the express purpose of entertaining visitors—principally children. They represent the Fishermen, Snow White and the Seven Courtiers; Ashputel, Red Riding Hood, Gretchen and Hansel, and others that are favorites among the little folk.

The Upper Gardens are more conventional in their Twenty-five or thirty acres of this land is covered with lawns, the remainder being set out to flower beds, shrubs and trees of all kinds and varities suited to our semi-tropic climate. Here grow a great many citrus fruits—navels, tangerines, grape fruit, lemons, loquats, etc. Here are also apples, peaches, apricots, prunes, the

bread fruit tree and other tropical fruits.

Including both gardens, there are fourteen miles of

drives and trails in the park.

All of this work has been planned and carried out through the generosity of Mr. and Mrs. Adolphus Busch whose sole desire is giving pleasure to the general public

as well as to themselves. The park is open to all who may wish to visit it and while away many pleasant hours. Visitors are welcome daily from nine in the morning until five in the evening. At night the gardens are lighted by electricity. The lights, gleaming out from arbor and tree are exceedingly effective and make the Upper and Lower Gardens even more beautiful at night than in the daytime, especially as the rays strike the water falls. It is at this time that the miniature mill of Banbury Cross in the Upper Gardens, is very attractive with its big water wheel and flood gates.

During the building of the Gardens the force of men employed often exceed a hundred. Even now the upkeep of the place requires twenty-two men constantly employed in the winter and about thirty during the summer.

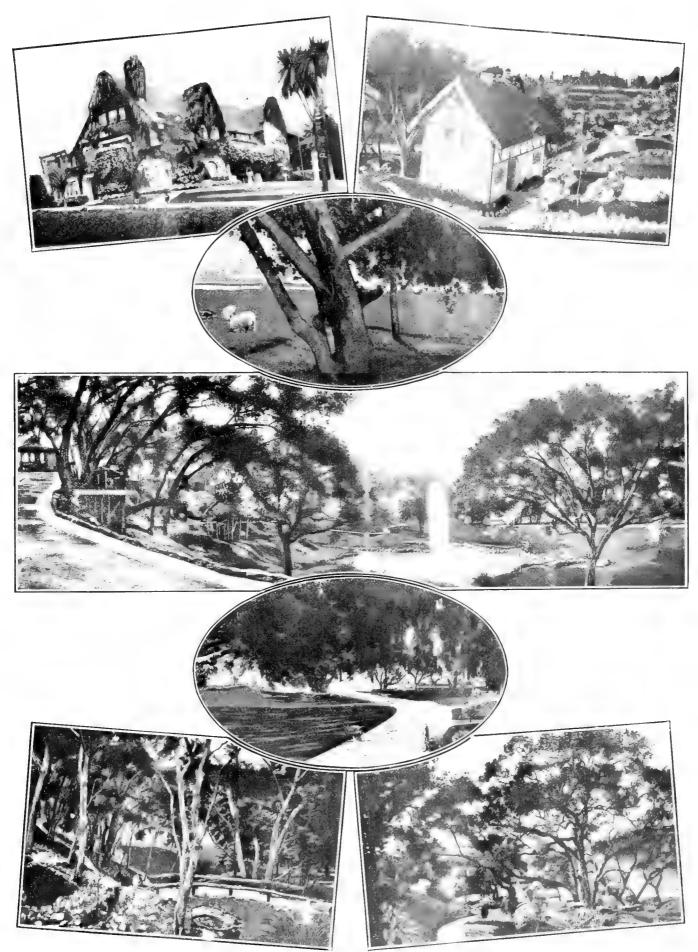

When Mr. Busch bought these grounds, it was prophesied that it would be an impossible task to turn them into a thing of beauty, for they were a waste of gravel, stone and sand, with here and there a patch of riotous growth; but Mr. Busch proved that "out of the coarsest rags the finest silks can be made" if you only have determination and an artistic eye.

The gardens being of a very hilly nature, a vast expenditure was necessary to protect them against damage by storm waters during the winter. This required thirtyeight carloads of storm water piping in sizes ranging from four inches to twenty-two inches in diameter, to carry off this water. Another heavy expenditure in the Lower Garden came from reclaiming a great deal of the acreage and making a new channel for the Arroyo Seco River which is dry during the summer months, Lut carries an immense flood down from the mountains, where it has its source, during the winter rainy season. This has been made to serve as a drainage for the Busch Estate. In changing its natural channel, a great deal of grading and filling in was required, besides the building of reinforced cement walls to confine its flooded waters. This river bed has now been turned into one of the beauty spots of the estate and has reclaimed many acres of what is now alfalfa land used as pasture for the sheep and a run for the turkeys.

No single city in California could adequately supply water to such a large estate—especially during the dry season. The Pasadena Water Department, therefore, could not supply Mr. Busch with the amount of water required to maintain these extensive Gardens; so Mr. Busch had to buy some fifteen acres of land about a mile east of the gardens, put down wells and install a pumping station. This furnishes to the Gardens daily one hundred miner's inches of water which is propelled by electric pressure against a resistance of forty feet.

ALIFORNIA—The general impression is that it is a land of heat and aridity, but as a matter of fact it has a varied climate—hot and dry in the south, agreeably cool in the middle section, with a mild winter season, while in the highlands of the north the great forests of evergreens prove that moisture and a very moderate temperature exist, without which they could not flourish. There can be no doubt as to the horticultural possibilities of California. Within twenty-five years it has become one of the chief flower and vegetable seed raising regions of the world. It is one of the richest fru't lands on our continent. Wealthy people from many parts of America are making themselves beautiful homes there, and the delightful winter climate of so much of California annually attracts thousands of visitors. From a botanist's and gardener's point of view it is one of the most remarkable lands that can be named. All the best plant, tree and shrub introductions of the Mediterranean region of China, Japan, Chili, New Zealand, Australia and South Africa have been introduced and flourish. Subjects that we in the east can only attempt to grow in greenhouses are here the favorite outdoor shrubbery or bedding plants. Think of its immense vineyards, its olive groves, orange, peach and prune orchards, its pineapples, avocados, apricots, cherries, figs, and nuts. It is the home of many of the finest of our annual flowers, such as Eschscholzia, Clarkia, Nemophlia, Platystemon, Gilia, Mimulus, Lupines, Coneopsis, which bloom from February until April, according to the latitude and altitude in which they grow. From the cacti of the south to the Big Trees near San Francisco, and the great pines upon the mountains of the northern tracts, California has a place for almost every class of plants. The hills afford a plentiful supply of water even in the hotter southlands, and with the skill of the growers and a reasonably good soil, even the hitherto drylands are being and have been converted into rich orchards and gardens.

During this mont

All Ws of THE Abot PHES BESCH ISTAIL PARALL  $-i(-\lambda, -1) \cdot OR^{\infty} T \lambda$ 

# Work for the Month of September

Conducted by Henry Gibson, New York.

THE FLOWER GARDEN.

Window boxes, hanging baskets, tubs and similar devices are now so full of roots that the soil is about exhausted, and to keep up a succession of bloom frequent applications of liquid manure should be given. Flower beds and borders are at their best now and a special effort ought to be made to maintain a tidy appearance. Decaying leaves, flowers, weeds, and other litter should be picked up at least once a week. Grass edges need to be kept trimmed and the lawn mowed as occasion requires.

The propagation of bedding plants should be attended to as soon as possible now. It is always advisable to take cuttings of tender subjects such as Coleus, Salvias, ageratum, etc., before the cold chilly nights set in. Geraniums may be left until later but even these should

not be caught by frost.

The handy flower border can be rearranged at this time, and new beds may be established. Early sown perennials are now large enough to set out into permanent quarters. Young plants of Hollyhocks, Foxglove, Gaillardia, Sweet Williams and Clove Pinks, if not transplanted before the last week of the month are better left undisturbed until next spring.

Old established plants of Anemone Japonica and

Tritoias are best moved in the spring time.

Most kinds of evergreens may be planted this month. Their success, however, depends on favorable soil conditions; as long as the ground is damp and free from frost trans-planting is safe.

Privet beech, thorn and other hedges should receive their final clipping without delay. Very little more growth will be made this year and by clipping now a neat, tidy appearance will be maintained for the rest of the season.

Lawns may be re-seeded if needed, and new ones established. Roadways, paths and walks that intersect a new lawn need to be edged with turf to protect the young grass when it comes up. Gravel and other garden paths made now will have a chance of becoming settled and well trodden before frosts come.

THE VEGETABLE GARDEN.

Potatoes should be dug as soon as they are ready. If you have a cool place to store them, they are better out of the ground this month. Spinach, turnips, radish, and any quick maturing crops may still be sown outdoors. Lettuce, cabbage, cauliflower, and parsley should be planted in cold frames. Don't let up in the fight with the weeds. Here and there you may have a patch that has matured its crop, but do not allow the weeds to make headway on it. Buy a bushel or two of rye, and as fast as these spots are "cleaned up" rake them over and sow the rye broadcast. Just enough loose soil to cover it and let it germinate is all it needs. It will come up quickly and not only keeps down the weeds, but will furnish an abundance of humus to the soil. Moreover, it will save "washing" of the soil by heavy rains, and prevent a great deal of plant food from being wasted.

FRUIT GARDENS,

All runners should be kept off strawberries and cultivation persisted in to prevent the growth of weeds. Young plants of strawberries that were potted up last month may still be set out. Apples, pears, and other fruits should be gathered in dry weather and placed in a cool, airy fruit room, as they are ready.

Peach trees need to be carefully examined for borers.

THE GREENHOUSES.

Chrysanthemums.

In last month's notes we made some reference to the feeding of chrysanthemums. This is usually done when the buds have set, and while it may be a good practice, yet we believe that, generally speaking, chysanthemums are very much benefited by judicious applications of stimulants long before the buds have formed. Of course the extent to which feeding will prove beneficial to the plants before the bud shows will depend a good deal upon the quality of the soil they were potted in. Every application of water takes away a certain amount of plant food and to keep a chrysanthemum growing, with its roots confined within the limits of an 8-inch pot until the buds set, without occasional feeding in some form or other, is very much like giving a boy his breakfast and then starving him until he becomes a man, and then try and feed him up.

Feeding after the buds set is a very good criterion for the amateur to go by, but the professional grower can obtain better results by the judicious use of stimulants as soon as the pots are well filled with roots. Don't go to the extreme with feeding, or a rank heavy growth with misformed and aborted flower buds may result.

### Bouvardias.

These early winter flowering plants are quite tender and should not be exposed to anything like a freezing temperature. They are better either benched or potted up now that we are liable to experience a frost any night. Endeavor to lift the plants with all the ball possible, thus preserving the fibrous roots. When planted, soak them well with water, spray freely overhead as long as the hot weather prevails and shade from direct sunshine until they become established. A minimum temperature of 60° is what suits bauvardias.

# Genistas.

These should be placed where they can have protection during frosty nights. Genistus need to be kept as cool as possible, without frost. If no protection is to be had outdoors, move them into the coolest house, where, during the winter the temperature should not exceed 45° at night.

# Decorative Foliage Plants.

Now that the sun is losing some of its power, croton palms, ferns and other foliage plants may have more light admitted by removing some of the shade from the glass. It is advisable to ventilate freely on all favorable occasions so as to harden the plants up as much as possible, previous to the coming of winter.

Attend to sponging, for scale and mealy bug, go over each plant carefully and see that none are allowed to be

overlooked.

### Summer Flowering Bulbs.

Almost all summer flowering bulbs require a season of rest. Such subjects as achimenes, gloxinias, gesneuas, tuberous rooted begonias, etc., as they pass out of flower should have water withheld so as to allow the bulbs to ripen up. They may be placed in a dry corner of the greenhouse where they are not liable to get much water, or they may be put into a frame and covered with sash until frost makes it dangerous for them to be left outside any longer. When this occurs, they may be laid on their

# UNIQUE MODEL OF A COUNTRY ESTATE.

A feature of the last Easter display at Phipps Conservatory, North Side, Pittsburgh, was a country gentleman's estate on a miniature scale.

The space covered by the exhibit was 14 x 26 feet, and was constructed by the laying of planking over part of the tank in the aquatic house. The planks were covered with soil and sown with grass seed from which a luxuriant crop resulted.

The residence seen in the illustration in the extreme rear centre was well constructed. Minute attention was paid to the various details, not only in the residence, but to everything connected with the entire estate.

The rustic house on the lawn, at the right of the residence, was made of bark and twigs, and had seats inside on which the dolls can be seen sitting.

The fountain in the immediate foreground was stocked with gold fish. The spray was run through volcanic rock Pansies and Antheneum border was quite effective. A tufa stone rockery extended across the rear of the

estate, and sufficient ferns and vines were placed among

them to partially conceal the stones.

The shrubbery used in the rear of the residence were Roses, Lilacs, Leutzia's, Lemoinia's, Weigela's, Hydrangea's, Tradescantea's and English Ivy, while at the rear of the rockery, there was a massive mound of Cineraria

The model was constructed by James Moore, gardener of Phipps Conservatory.

# MAKING A ROSE GARDEN.

Good exposure to the sun, the proper protection from prevailing winds will do much to make the rose garden a success. While a location with a full-day sun exposure is much to be preferred, it is not absolutely essential, and where a choice must be made

MODEL OF COUNTRY GENTLEMAN'S ESTATE ERECTED IN PHIPP'S CONSERVATORY, PITTSBURGH, PA.

(Tufa stone), while on the surface of the water you can see the miniature swans.

The handy man on the estate can be seen to the rear left of the fountain, where he is busy cutting the lawn, his rake being handy.

The barn to the left of the residence was also true to detail, chief of which were the sliding doors at the entrance, and the block and tackle on the second floor.

The old pump that supplies the barn can be seen at the left of the barn.

The kindergarten classes from the public schools were brought to view the display, and it was a difficult task for their teachers to draw them away from this feature

The plants used along the border of the driveway and walk were Eckeveria (Secunda Glanca). Those used as trees in front of residence are Junipers Virginiana, and they answered the purpose splendidly to carry out the impression of being ornamental lawn trees.

The flower beds at each side of the fountain made up of

it is best to give roses the morning sun. Beds should not be located near trees or shrubbery. Roses are heavy feeders and for their best development require an unusual amount of fertilizer; when planted near trees or shrubbery, the roots of the latter deplete the soil of nourishment, with the result that the roses suffer. If, however, planting in close proximity to trees and shrubs is unavoidable, it is advisable each year to dig a trench (about a foot wide and 2 or 3 feet deep) around the rose bed and fill with wellrotted cow manure. This procedure will tend to prevent the roots of shrubs from actually entering the rose bed. Sometimes a concrete wall is constructed deep enough to prevent this encroachment.

Roses usually do well in any good garden soil, but better results are obtained if considerable care is exercised in the preparation of the ground. Roses require a heavy, well-drained soil. To obtain this, the area to be used for a bed should be dug out to a depth of from 18 inches to 2 feet, and if the drainage is not

good another 6 inches should be removed and this space filled with fine broken stone, brick or old flower pots. Upon this porous stratum 6 inches of well-rotted cow manure should be placed, and finally sufficient heavy soil to finish the bed, raising it not more than 3 inches above the surrounding grade. This latter layer should, if possible, be top soil (including sod) from an old pasture. After making the bed it should be allowed to settle for a week before the

planting is begun. Roses may be set out either in the fall or in the The spacing depends very largely upon the variety; tea and hybrid tea varieties may be planted about eighteen inches apart, but hybrid perpetuals, on account of their more vigorous growth, should be spaced at least 2½ feet, and ramblers eventually need about 4 feet. In any case an eight-inch margin from the edge of the bed should be allowed. Where potted stock is being planted, the ball of earth should be placed with its upper surface about 2 inches below the soil; fieldgrown stock may be set 2 or 3 inches lower than its former position in the nursery. The holes for receiving the plants should be large enough to admit the stock without bending or crowding the roots, the soil should be firmly packed around the roots, and the plants thoroughly watered immediately after planting. All stock should be so pruned that but two or three buds remain on each shoot—the upper bud, in each case, pointing outward.

Rose stock may be either grown on its own roots, or grafted or budded. It may be well in this connection, however, to call attention to certain disadvantages which attach to budded stock. In general, budded stock is more easily killed in severe winters than is stock grown on its own roots, and in addition the shoots which invariably spring from the parent stock frequently suppress the scion unless cut away. On the other hand, there are varieties of roses which it is impossible to grow satisfactorily unless they are budded on to a hardier stock.—From Missouri Botanical Garden

Bulletin.

# WORK FOR THE MONTH OF SEPTEMBER.

(Continued from page 350.)

sides in a dry shed and later on shaken out, and stored in boxes where the temperature does not go below 50°.

Miscellaneous Plants.

No time should be lost in dealing with Roman Hyacinths, Paper White Narcissus, Duc Van Thal Tulips, and similar early flowering bulbs that are intended for Christmas use. Others may be potted for a succession.

Single Violets may be planted if not already done. Early planting is advisable where frame culture is adopted, so that the plants will produce a crop of blooms before cold weather sets in.

Primulas, Cinerarias and Cyclamen that have been grown in cold frames should be brought indoors this month. Pot on such as require it. Cyclamen should be ready to put into their flowering pots. Keep them clean by frequent spraying and fumigation. Stevia and solanums are tender plants and should be lifted and placed in a cool house before cold nights overtake them.

# CULTIVATION OF DWARF FRUIT TREES.

In his lecture on dwarf fruit trees before a gathering of gardeners who congregated at "Homewood," New Rochelle, N. Y., to inspect the fruit gardens there,

Nicholas Butterbach, who is superintendent of the estate, stated that the trimming of dwarf fruit trees is resorted to, first,—to give the tree a regular form and to evenly distribute the sap; second,—to force the tree to bear; third,—to keep the tree in bearing condition; fourth,—to get bigger and sometimes earlier fruit and better quality; fifth,—to prolong the life of the tree.

The proper cultivation of dwarf fruit trees, with regular forms, like Pyramids, Cordons, Espaliers, etc., he remarked, is to raise a certain amount of trees in different shapes without difficulty in small space with better fruit and more production. A continuous production can be had by leaving only a certain amount of fruit each year and getting a more satisfactory growth. The fruit left on the tree in proportionate quantity is according to its vigor so that each will get its proportion of nourishment, sun and air required for bigger volume and better quality. The maturity is hastened by the effect of pinching, sun and air.

Mr. Butterbach declared that pruning and pinching is necessary if the work is to be done according to vegetable physiology. If improperly done it will prove detrimental to fruit production and to the tree. The winter pruning is distinguished from the summer pruning in that the winter pruning is done from the time that the sap has entirely stopped flowing until before it starts flowing again, while the summer pruning is done from the time vegetation commences in the spring until the end of

August.

Pinching has the effect of forcing the sap in the useful spurs, in throwing out new shoots and setting others to fruit. The severity of the pinching depends on the vigor of the tree and its bearing quality. Young trees not entirely formed are the more severely pinched to give them regularity and form, also to set them to bear. If two growths are on the same spur, one is pinched while the other is left to be pinched much later, for if the two growths were pinched at the same time, the sap would push the eyes to new growth and would have to be pinched again and again without getting the result we are aiming at, namely, fruit buds. If there are more than two growths on the same spur, they are entirely cut out.

Pinching should be done gradually, for if it is practiced too much at a time the fruit buds will develop into wood buds.

The gourmand is a spur which is easily distinguished by its proportion from that of its neighbors. The eyes near the base are very small and far apart, while those on top are big and develop full shoots. The gourmand lives where the circulation of the sap is strongest; it takes the nourishment from the other spurs and destroys the equilibrium of the tree. Gourmands are more frequently found on apple cordons than any other tree, they must be pinched more frequently than other spurs to distribute the vigor of the tree. The brindle is a spur, long and flexible, six to eight inches long, and has very small eyes. It is not disposed to grow strong and is one of the first sources of fruit. If there are enough of fruit buds on the tree, the brindle is cut to two or three eyes, otherwise it is left alone.

Summer pinching is one of the most important operations in the culture of the fruit tree. It should not be done too early, as the sap is apt to leave the pinched part and would produce nothing, while on the other hand, if pinched too late well-formed eves would develop instantly and the result would not be satisfactory. Pinching ought to be done to three, four, five, or six leaves or eves, according to the variety or growth. Young trees should be more severely pinched than the older ones, and this practiced until they are entirely formed.

## CAVITY TREATMENT OF TREES.

By F. A. Bartleil, Connecticut.

The people of this country are at present giving a great deal of attention to the care and preservation of their trees, but they are still far more concerned in the repairing of a tree broken by the storms, or the filling of cavities formed by wood-destroying fungi than in preventing these injuries. Everybody should bear in mind the fact that it is far more important and effective to prevent these cavities than it is to repair them, after they are formed. Properly filling a cavity will prolong the life of a valuable tree for some time, but rendering the tree resistant to disease by caring for the small wounds and giving it plenty of proper nourishment will enable the tree to live almost indefinitely. In order to be able to guard against decay it is necessary to know its cause

DECAING WOOD SHOULD BE DUG OUT UNTIL GOOD HEALTHY TISSUES ARE REACHED.

and how it obtains a hold upon the tree. The outer bark is the tree's natural protection against disease, and if this were never broken it is perhaps safe to say that no cavities could be formed. Unfortunately, however, the bark very frequently is injured. The surrounding air is filled with spores of many kinds of wood-destroying fungi. As soon as the surface is exposed the rot fungi gains foothold and in time a cavity is formed, which even with the best care is apt to grow gradually larger and finally the tree is lost.

The beginning of cavities is due to numerous causes. the principal ones being wind, lightning, ice-storms and boring insects, or a small branch only may be broken off which receives no attention. Wood-destroying fungi enters at the exposed surface and gradually weaken the branch until a sudden storm breaks it. A large area is then exposed and the decay continues until the larger branch is broken, and thus the decay may work its way

into the very heart of the tree and finally the whole tree is blown down. The proper treating of the small wounds with a protective dressing might have been the means of saving a valuable tree. However, since people are not aware of the great importance of constantly guarding against the entrance of the wood-destroying fungi, cavities are formed and once formed should immediately be treated in such a way as to arrest as far as possible further decay. Although decay in trees is comparatively slow we are much more certain to stop entirely the rot in a small cavity than if we wait until it is of consider-

First, all decaying wood should be dug out until good healthy tissues are reached. The shape of the completed cavity should be such that it will naturally hold firmly whatever material is used to fill it. Very shallow cavities are not filled at all, but covered with a good wateroproof antiseptic dressing. A groove should be cut back of the edge of the bark into the wood a half inch or more. After the cavity is cleaned and correctly shaped, nails should be driven into the inner surface of the cavity to hold the cement. The inner surface should then be

CONCRETE THITING BUILT IN SECTIONS
NEW GROWTH WILL SOON FORM
OVER THE FILLING, IF THE TREL IS VIGOROUS.

thoroughly cauterized with some antiseptic material such as carbolineuim, creosote or tar. Sometimes in case of water collecting in the base of the cavity copper sulphate crystals may be added. The cavity may then be filled. Cement has thus far proved to be the most satisfactory material for filling cavities of any size. It has been found that solid cement will crack with the swaying of trees. This can be overcome by building in the cement in sections. These sections move slightly one over the other, whereas, in the case of solid cement cracks would be made. The filling should be built to conform with the contour of the tree and the edges flush with the inner bark to provide the best possible conditions for rapid

(Continued on page 374.)

# Aquatic Plants for Every One's Garden

By Samuel D. Zehring, Massachusetts

In most any garden, regardless of size, shape or conditions of the grounds, water may be introduced, providing it be in harmony with its surroundings. natural sheets of water do not occur, an artificial pond is of easy construction. These are usually more or less formal or geometric in outline. The restriction of certain plants is more pronounced here than in the natural lake; and almost limited to the lilies and grasses. If the more tender aquatics are to be used, it is important to protect the pond from north winds by trees and shrubs, evergreens preferably, placed back far enough not to over-shadow the waters.

Probably no aquatic is more appreciated than the Nymphaeas. Their colors range from purest white, through delicate pinks to deep reds; from purples to lightest blues; and from pale yellows to deeper salmon. They differ not only in color, but in their time of blooming. Some open at daybreak, others later in the day, while the Nymphaea Lotus appears with the evening star, and with others remain open throughout the night. Most of the blossoms float on the surface of the water, but some are carried 18 inches above the surface and vary in size from 3 inches to 15 inches in diameter. A few of the stronger ones rise to a height of 6 to 8 feet.

As to grasses which may be well grown in the formal pool, the long, narrow leaved ones, ornamental or colored, are better than the larger coarse plants, except such as Caladiums, which are quite attractive about the foun-

Erianthus Ravennae, resembling the Pampas Grass in habit and flowers, is one of the best. The leaves and stems are tinged with purple, and the flower plumes are borne on stems 5 to 10 feet high. It should have a deep. rich soil and be exposed to the sun.

Eulalia gracillimus has narrow, green leaves, with a white stripe down the center of each. It is very graceful with its leaves, 8 feet in length, drooping to the ground. It attains its greatest development when used as a specimen plant.

The well known Pampas Grass (Gynerium argenteum) is one of the best we have, but is rather tender and should only be used on sheltered position.

The Calamus gives several good varieties. gramineus variegatus is one of the most attractive, with its narrow, grass-like leaves striped with white. It does well in moist soil or shallow water.

Cyperus alternifolius, the Umbrella Plant, makes a beautiful specimen, growing 3 feet in height, and sending up symmetrically shaped leaves radiating from the tips of the stems, having the same tufted head as Cyperus Papyrus.

For the natural ponds and streams, almost any of the water-plants can be used to advantage, and from the almost unlimited assortment, the gardener can produce any effect or motif desired. But for the natural planting. the variegated forms would best be omitted except in few occasions

When a background is desired, any of the evergreens may be used. Rhododendrons also, give excellent results when planted at the water's edge where their charms are doubled and enhanced. The Kalmias, like the Rhododendron, delights in a moist, peaty soil, and is one of our most charming native plants. Neither of these should be planted on a small island, but on the mainland, where their mass will not counter-balance their setting.

very effective along the water. The leaves are light green above, and pale beneath. Its attractiveness is even greater in the winter when its bright red growth is so prominent. To preserve its beauty a severe pruning is necessary in the spring.

Magnolia glauca also finds itself at home in the swamps. It is a shrub-tree with bluish green leaves,

and sweet-scented, cream-colored flowers.

Cyperus Papyrus is one of the most graceful plants in the water garden. It should be planted in a box of soil and set a few inches below the surface of the water. Its long stems grow 10 to 15 feet high, and bear fluffy plumes of fine grass-like leaves at their tips. It is tender and must be protected.

Lizard's Tail (Saururus cernuus) is fine for the margin. It is a hardy perennial with heart-shaped leaves, and fragrant white flowers. It reaches 2½ feet in

Typha latifolia, the common Cat Tail is well adapted for planting along the water. The leaves are flat, long The flower is a brown cylindrical spike, borne on a 6-foot stalk.

Calathea zibrina requires a shady spot. The leaves, 3 feet long and half as wide, are a beautifully velvet green, barred with purplish green.

Fatsia papyrifera is an interesting plant, 5 feet high. Its leaves are cordate, 5 to 7 lobed, and about 1 foot in

diameter. Monstera deliciiosa is a good border plant with perforated leaves, 3 feet long and 1 foot wide. The margins

are deeply cut. Acorus calamus has erect lance-shaped leaves, 3 feet

high, and does well in shallow water.

Pontederia cordate, the Pickerel Weed, is one of the handsomest of aquatics for shallow plants. It grows 2 feet high, bearing purple flowers throughout the sum-

Many other plants may be used and each having a place that can be filled by no other. Besides the foliage aquatics, there are a great many perennials adapted to moist soils and useful for their flowers.

Probably none in this class are so common nor yet so fine as the iris which has been so emphasized in the Japanese gardens. A great variety of tints, shades, and combination of colors are to be found here in the various types. They are particularly fine for massing along the open margin of the lake or bordering a small stream in clumps.

The flowering rushes resemble the Iris in foliage. They

grow 3 feet high and bear rose-colored flowers.

Dicentra spectabilis, while not preferring wet soil, delight in a moist shady spot, where they reach 2 feet in height, and send out long, graceful recemes of rosycrimson flowers.

Lobelia cardinalis should be largely used around the pond. It grows 2 to 4 feet high and its flowers are bright, cardinal red, on long spikes, from July to Sep-

Spiræa aruncus, one of the finest, grows luxuriantly in a rich moist soil or at the water's edge. It stands 3 to 5 feet high, with beautifully divided leaves and white gracefully drooping plumes in June and July.

This article hardly seems complete without mentioning the Weeping Willow always seen along the pond. Its most fitting place is by a falls where the vertical lines Cornus Stolonifera, growing 6 to 8 feet in height, is of the water will be in harmony with those of the tree.

# AMERICAN SWEET PEA SOCIETY'S SHOW

The seventh annual exhibition of the American Sweet Pea Society, which was held in conjunction with the Newport Horticultural Society and the Newport Garden Association, at the Casino, Newport, R. I., July 15-16, was the most successful sweet pea show ever held in this country, both in quantity of exhibits and in quality of blooms. The exhibit was largely attended, many gardeners coming from a distance. A large delegation traveled from New York, while a special party, members of the Boston Florists' and Gardeners' Club, numbering nearly 150, journeyed from Boston.

The achievement of Edwin Jenkins, superintendent to Giraud Foster, Lenox, Mass., who won many firsts, is deserving of special mention.

At the convention of the American Sweet Pea Society, which was held in connection with the show, the following officers were elected: President, William

a vase, to be showe with sweet pea foliage only, cup to a won twice 1, Arthur Curits Lemes 2, 2, Giraud Foster.

Gray, Newport, R. I.; vice-president, George W. Kerr, Doylestown, Pa.; Secretary, Harry A. Bunyard, New York, N. Y.; treasurer, A. T. Boddington, New York, N. Y. It was voted to hold the 1916 Sweet Pea Show at Bar Harbor, Me. It was also suggested that separate exhibitions may be held next year in New York and in other cities if sufficient enthusiasm can be worked up to get the growers to act.

The list of prize-winners in the gardeners' classes follows:

AMERICAN SWEET PEA SOCIETY'S AWARDS PRIVATE GARDENERS.

Class A 1. Peter Henderson & Co.'s prizes for the best vase, 20 prays to a vase, of 12 distinct varieties of Spencer Sweet Peas—1, iraud Foster, Lenox, Mass. (superinfendent, Edward Jenkins); 2, 17s. Robert Winthrop, Lenox (superintendent, S. W. Carlquist); 3, 17thur Curtiss James (J. H. Greatorex, gardener).

Mrs. Robert Winthrop, Lenox (superintendent, 5, w. Cariquist), 9, Arthur Curtiss James (J. H. Greatorex, gardener).
Class A 2. The Thorburn prize, a silver cup, for the best 12 vases of sweet peak, Giraud Foster.
Class A 3, The Arthur T. Boddington prizes a silver cup and cash, for the best collection of 25 varieties, not less than 20 stems to

2. Mrs. French Vanderbilt (David Hay, gardener). Winthrop.
Class B. 3. The Henry F. Michell Co.'s prize, silver medal for six vases, 25 sprays each 1. Col. Charles T. Pfaff.
Class B. 4. The "Michell Seed House" Bronze Medal, for best 25 blooms "Huminator," 1. A. N. Cooley.
Class B. 5. The "Michell Seed House" Silver Medal, for best vase Spencer varieties mixed, not less than 100 blooms—1. A. N. Cooley.
Class B. 8. The Thomas J. Gieva Co.'s prize, a Cut Glass Bowl, for the best centerpiece of Sweet Pras. 1. Mrs. W. W. Seeman, 2. Mrs. T. J. Emery.

J. Emery. Class B 9 The Wetkins & Simpson prize, for the best six vases Sweet Peas six varieties, 20 flowers to a vase 1 810,

Class B 9 The Wetkins & Simpson prize, for the second of Spencer Sweet Peas six varieties, 20 flowers to a vasc 1 810, Graud Foster.

Class F 2, The Jerome B, Rice Seed Co,'s prizes, for the best vase of 1915 novelty Sweet Peas, 20 sprays of one variety—1, Graud Foster; 2, Mrs. Robert Winthrep.

Class F 3. The Lord & Burnham Co's prize efforts grewers only a Gold Watch, for the best display of Sweet Peas, arrangement to count—1, John G, Halford, Bar Harbor; 2, Osear Schultz, Newport,

NEWPORT 6 ARDEN ASSOCIATION SPECIAL PRIZES

Class G.1. For the best tub of Sweet Peas of any white, cream or cream-yellow variety 1, Stuart Duncan; 2, Miss Edith Wetmore; 3, Mrs. T. J. Free Y. Class G.2. For the best tub of any scarlet, crinson rose or carmine 1, Mrs. W. G. Weld; 2, Mrs. Emery. Class G.3. For the best tub of any lavender, mauve, purple or blue—Stuart Duncan; 2, Mrs. Emery. Class G.5. For the best display, arranged against a wall, on a table space of 3 feet x 10 feet—1, Silver Cup, Mrs. Weld; 2, Mrs. Emery; 3, Captain Roger Welles, U. S. N. Golm Fletcher, gardeners.

NEWPORT HORTICULTURAL SOCIETY-SPECIAL PRIZES.

Class G. G. (25) sprays Sweet Peas (Spencer varieties), and white variety [1]. Girand Foster, wit Karg White; 2, Mrs. Robert Winthrop. E. Mrs. Prench Vanderallt.

Class G 7. 25 sprays, any climson or scarlet 4, Giraud Foster, with King Edward Spencer; 2, Mrs. Robert Winthrop; 3, Arthur N.

Class G S. 25 sprays, any rose or carmine Girand Foster, with Rosabelle; 2, Miss Alice Kelteltas (William J. Matson, gardener); 3, Robert W. Goelet (Colin Robertson, gardener).

Class G 9, 25 sprays any light pink 4, Girand Foster, with Eltrida Pearson; 2, Mrs. Robert Winthrop; 3, Arthur N. Cooley.

Class G 9, 25 sprays any light pink 1, Girand Foster, with Eltrida Pearson; 2, Mrs. Robert Winthrop; 3, Arthur N, Cooley.
Class G 10, 25 sprays, any dop pink 1, Girand Foster, with He, odes, 1, Mrs. Robert Winthrop; 3, Robert W, Goelet
Class G 11, 5 sprays, any blue—1, Girand Foster, with May 1 depther, 2, Mrs. Robert Winthrop; 3, Arthur N Coole;
Class G 11, 25 sprays any manve 4, Girand Foster, with Leske Imber; 2, Mrs. Robert Winthrop; 3, Robert W, Goelet,
Class G 12, 25 sprays any cream or cream yellow 1, Mrs. French Vanderbilt, with a fine vase which we did not find named; 2, Girand Foster; 3, Henry A, C. Taylor (William MacKay, gardener).
Class G 14, 25 sprays, any salmon or orange—1, Girand Foster, with May Unwin; 2, Mrs. Robert Winthrop; 3, Arthur N, Cooley,
Class G 15, Sprays, any lavender 1, Girand Foster, with Den Alva; 2, Mrs. French Vanderbilt; 3, Robert W, Goelet,
Class G 16, 25 sprays, any maroon or purple—1, Girand Foster, with Royal Purple; 2, Mrs. Robert Winthrop; 3, Henry A, C. Taylor,
Class G 17, 25 sprays, any striped or flaked red or rose 1, Mrs. Winthrop, with American Spencer; 2, Robert W, Goelet,
Class G 18, 25 sprays, any striped or flaked red or rose 1, Mrs. Winthrop, with American Spencer; 2, Robert W, Goelet,
Class G 19, 25 sprays, any striped flaked blue or purple—1, Mrs. Vanderbilt, with Bertie Usher; 2, Girand Foster; 3, A, N, Cooley,
Class G 20, 25 sprays, any striped flaked blue or purple—1, Mrs. Vanderbilt, with Bertie Usher; 2, Girand Foster; 3, A, N, Cooley,
Class G 21, 25 sprays, any other color distinct from the above—1, Girand Foster; 2, Mrs. Winthrop, Class G 21, 25 sprays, any other color distinct from the above—1, Girand Foster; 2, Mrs. Winthrop; 3, Henry A, C, Taylor.

PRESIDENT ELECT WILLIAM GRAY.

President-elect William Gray, of the American Sweet Pea Society, was born near Edinburgh, Scotland, on the Arburthnot Estate, Mavis Bank, on April 20, 1874. His father was head gardener on this estate, the profession of gardening having been followed in the Gray family from father to son for several generations. In 1883 Mr. Grav came to America with his parents who settled in Middletown, N. Y., where his father secured the position of florist at the State Hospital. After leaving school Mr. Gray served his apprenticeship under his father and obtained his further experience as assistant gardener around and in New York and Newport. He obtained the position of head gardener to Horace Russell, Southampton, N. Y., where he remained for five years. For the past five years Mr. Gray has been in his present position as head gardener to Mrs. William B. Leeds, Newport, R.

I. He is well known in the gardening profession as an excellent grower and thorough horticulturist.

In accepting his office as president of the American Sweet Pea Society, Mr. Gray said in part: "I appeal to every florist, gardener and amateur to join this society. The gardener is the one to get the amateur interested by giving freely of his advice in regard to methods of growing, etc. In every community the gardener can take at least one amateur under his guidance and help arouse the amateur spirit which is so latent on this side of the Atlantic. This is right in line with the work of horticultural societies-the promotion of horticulture.'

### THE PROPER TURF FOR GOLFING GREENS.

It has always been my opinion, and I state it here right boldly, that turf of the best English quality can be developed on putting greens anywhere in the sections of the country covered by my tours, provided that the greens are properly prepared, fertilized, and top-soiled, if necessary, so as to form a seed bed of rich, friable soil of a minimum depth of four inches with all undulations fashioned with runaway surface outlets for storm water or melting snow in order to prevent, as far as it is humanly possible, any such accumulations when freezing and thawing conditions alternate and when the natural or artificial drainage, as the case may be, is put out of commission by the frozen sub-soil, writes Reginald Beale, F. L. S., in Golfing Illustrated. The so-called winterkill is bound to occur if such methods are not adopted and valuable time and money will be wasted.

Always, if possible, arrange for early fall sowing and regard the period between mid-August and mid-September as the selected moment. When the first rains come in the fall, the soil is so warm that the seeds germinate very quickly, and if sown thickly get well established and self-protecting before the winter sets in.

In the spring the soil is cold, and in consequence the seed not only germinates slowly but it also grows slowly, and the young grass plants have to face the heat and more especially the drought of the summer when in a very voung, weak state, very often with evil results. Also in spring, weeds and other obnoxious growths are much more prevalent than in the fall.

When making or contouring a green, remove the top soil, work with the sub-soil and finish off by replacing the top soil in an even layer over the green. The separation of the soil and the replacement of the same cannot be done properly by scoops, so it is always advisable that this section of the work should be done by hand, with spades and barrows.

All drains should be laid before the top soil is re-

In making up greens, each scoop or barrowful, as it is shot down, should be carefully trodden; otherwise the surface will sink later.

Always, if possible, make surface runaways from undulations, otherwise water will accumulate with disastrous results to the turf.

Water freely during droughts and in the evenings, if possible, as best results are then obtained. The water applied at that time does most good and does not evaporate as quickly as it does if applied in the heat of the day. In any case, water freely, and remember that one good soaking is worth a dozen light sprinklings.

Eradicate and destroy all weeds as soon as they appear, do not let them multiply, and remember that wire, witch, crab and September grasses get hold best in weak or exhausted greens. If you cannot exterminate the latter, keep them, like clover, in check by lifting the creeping or prostrate stems and branches with a close-toothed iron rake and mow closely; repeat this as often as neces-

Topdress freely with a finely sifted compost of a light, friable, porous nature, rich in organic or fertilizing matter, so as to reduce the plasticity of the soil if it is too heavy and to add body if it is too light, and when doing so remember that a cubic yard of compost will cover 144 superficial yards to the depth of a quarter of an inch, and that sixteen dressings at the above rate spread over say, three years, will reduce the natural top-spit soil of the dressed area to the secondary position of the subsoil, so there is hope for all greens, no matter whether they stand on sand or clay. The contouring and general preparation of a green is costly and its upkeep is more so, consequently it is the worst economy to be parismonious when seeding. In England, with our warm genial climate, we sow one ounce to a superficial yard and expect to get a close turf in a year or less, and when we are in a hurry we sow at the rate of two ounces per super yard.

In America and Canada, where the climatic conditions are, to say the least of them, extremely severe and difficult, the minimum rate should be two ounces per square

yard and the maximum, four ounces.

A true golfing turf is composed of dwarf creeping grasses, which form a close-soled, springy sod, which is both a delight to walk over and play on, as it holds the ball from the ground so that it sits up and looks at the player, and when a divot is taken the club cuts through the matted fibrous roots of the grass without hardly touching the soil.

Turf which does not answer the above description is not golfing turf at all; it may cover the ground and make it look nice and green and so mislead the casual observer, but it is worthless from a golfer's point of view,

and that's all there is to it.

I will now attempt to explain the reason for the lack of really good turf in America. In the first place, the best natural turf in the British Islands is found in locations that have been nibbled close by sheep or rabbits for years, and the best artificial turf where mixtures of grasses have been sown and where the turf has been closely mown from the very start.

Secondly, the great majority of the artificial or sown courses in America have been sown with venerable prescriptions propounded years and years ago for agricultural purposes before golf was known out of Scotland.

I might state here that eighteen years ago not only was it considered impossible to produce fine turf from seed, but there was absolutely no demand for it, but when the game of golf took hold of the civilized world, I saw that the ordinary commercial mixtures of lawn grass seeds and the old methods of turf production must go by the board and new methods and new mixtures take their place.

The third reason is the antiquated idea that the indigenous or native grasses are best in their own sections or zones, because they are indigenous or native, an argument which absolutely bolts and bars the door to any sort of improvement and is as worthless as it is futile.

The fourth and last reason is the improper ratio in which the various varieties are used (even when the mixture is made up of correct varieties) and also the thin

sowing.

The rate the seed is sown per acre is another very important question, and no matter from what point of view the subject is tackled, financial, common sense, or golfing, heavy sowing is undoubtedly the best and cheapest.

Judged from the common-sense point of view the advantages of heavy sowing are just as striking, especially if one remembers that a close turf is either composed of

relatively a few large grass plants which may take a year or more to mature, or a multitude of small ones which can be produced in a few months and which improve with age.

If the seed is sown heavily at the right reason the little grass plants are crowded together and so afford each other shade and protection from wind or sun almost from the start, whereas, if light sowing is resorted to, the little grass plants have got to stand alone, and a poor chance they get if adverse weather sets in, either in the shape of a cold dry wind or a hot scorching sun. It is wonderful what a little shelter will do; I have frequently noticed that the seed in the hoof-marks made by horses harrowing and rolling in the seed gets quite a start on its exposed neighbors, and where the seed has been gathered together by a wash-out it comes up like hairs on a cat's back and is self-protecting from the very start.

### POISON IVY.

Experiments in destroying poison ivy by means of chemicals have developed only a limited field of usefulness for this method. Applications of strong solutions of crude sulphuric acid or of crude carbolic acid have been found effective, but serious risks are encountered in handling these substances. In work undertaken by the Massachusetts Experiment Station it was found that arsenate of soda could be used very successfully to kill poison ivy on large trees over 6 to 10 inches in diameter and on stone walls, buildings, etc. In open fields, however, this treatment proved expensive and injurious to other vegetation, rendering the land useless for several years. In these experiments two or three applications of arsenate of soda at the rate of 2 pounds to 10 gallons of water were generally sufficient. The preparation is poisonous and stock must be kept away from the poisoned plants. The cheapest and most effective method of eliminating poison ivy seems to be the simple one of rooting up the plants and destroying them. In large fields it may be necessary to plow and cultivate the land, says the U.S. Department of Agriculture.

The safest time for handling poison ivy is in the Fall, after the sap is out of the plants and after the plant has stopped flowering, as the sap and pollen make the plant more likely to affect those who come in contact with it. In any case, however, the following protective measures should be used by those attempting to eradicate it. With the exercise of due care, the use of overalls and gauntleted gloves will enable most individuals to deal with the plants with impunity. The further precaution of greasing the hands with lard, to be washed off with strongly akaline soap on conclusion of the work, has been recommended. It may be possible to employ some one to remove the plant who is not affected by it, since many individuals are practically immune from the effects of poison ivy. In burning poison ivy care must be taken to keep away from the smoke, as cases of serious injury to eyes, rose and throat from the poison conveyed by this means have been reported.

The toxic properties of poison ivy are attributed to a nonvolatile oil which is found in all parts of the plant even after long drying. Minute amounts of this oil are capable of causing extensive inflammation. The oil is insoluble in water but may be removed by alcohol or destroyed by a solution of sugar of lead and alcohol. As a preventive measure thorough and repeated washing with warm water and strongly alkaline soap as soon as possible after contact with poison ivy is advisable, and it should be borne in mind that the poison may be transferred indirectly from clothing, and implements, also from towels used by those who have been in contact with the plant.

### MUSHROOMS AND TOADSTOOLS.

The rambler who has never had his attention attracted by the lowly and unassuming toadstool, must be blind indeed. In summer and autumn, go where he will, in field, woodland and thicket, the representatives of this widespread family appear. Many people are wont to assume that out of all this host there is but one edible species, distinguished as the Mushroom, while all the others are poisonous toadstools. In fact, the idea that the possession or lack of noxious qualities divides these plants into two natural groups is very general. mycologist, however, selects and eats many which are regarded as toadstools-one individual claims to have tested five hundred species—while the unscientific who feel confident that they can distinguish mushrooms at sight, frequently select the wrong kind and the next day furnish employment for the undertaker and the obituary editor. The majority of our species are probably harmless, but there are unquestionably many that are noxious, harmful or even deadly posionous.

There is really no difference between a toadstool and a mushroom, unless we choose to regard the poisonous species as toadstools; but in this case we shall be scarcely scientific. The harmless and noxious species do not belong to different genera but occur side by side in the same group. Among the *Amanitas*, some species are regarded as especially toothsome, while others are

among the most deadly known to mycology.

Many rules have been put forth for distinguishing the harmful species, but all but two of them are more or less unreliable. The first is to learn to know them by their specific characteristics, just as one learns to know an elm or an oak, the second is to eat the suspected species. In the latter case, if the investigator lives, he will be safe in recording his plant as edible and harmless. The novice should be cautioned against eating any species of whose identity he is not absolutely sure. It may be reiterated that the proportion of poisonous to harmless species is relatively small, although the former often make up in numbers what they lack in species. It is a curious fact that while the unwholesome species produce their effects within a short time, the really deadly ones do not begin to operate until from eight to fifteen hours after they are eaten—by which time they may have been nearly forgotten, and the sufferer may thus fail at first to connect cause and effect. The development of the trouble is then rapid and no time should be lost in sending for a physician. Even at this stage there is an antidote for the poison in atropine, itself a deadly poison. It is administered in subcutaneous injections.

There are not a few people who would scarcely regard mushrooms as plants. Their lack of leaves, true roots, green coloring matter, etc., seem to make out a good case against them, but with all this evidence, one would still be disinclined to call them animals, although they possess the animal-like characteristic of requiring readymade or organic food, and are unable to obtain sustenance from the earth, air and water, as ordinary green plants do. They are therefore reduced to the position of scavengers, living upon other plants, and animals, dead or alive. Mushrooms belong to the flowerless division of plants, of which the ferns are among the higher types. Their place in the line of relationship is below the ferns, below the mosses and liverworts, almost at the foot of the ladder of plant evolution in fact. Their nearest allies are the seaweeds and the green scums that are often found in fresh water pools. By many they are supposed to be degenerate offspring of the higher seaweeds. Like all the flowerless plants, they have no seeds but are propagated by spores which serve the same purpose. A spore falling in a proper situation for growth, soon gives rise to a tangle of threadlike structures which forms the body of the plant. This substance made into bricks and dried, is the mushroom "spawn" sold by the dealers. At intervals little rounded knobs form upon the mushroom threads and later develop into the familiar umbrella form. If the "spawn" is exposed to unfavorable conditions, it is said to be able to wait for years for a chance to fruit. The mushroom, it may be said, is only the fruiting part of the plant, comparable in a general way with the flowering spike of the century plant, although not homologous with it. On the underside of the umbrella-like cap are numerous radiating plates called gills which support the structures on which the spores are produced. By cutting off this cap and laying it, gills down, on a clean piece of paper, there will be produced in a few hours a "sporeprint" in exact duplication of the arrangement of the gills, and due to the shedding of the numerous spores. Usually the spores are of the same color as the gills, although in some species they are

The mushrooms are classed with the higher fungi. Among their poor relations are numbered the rusts, smuts, blights, mildews, molds and bacteria. The puff-balls and morels are also nearly related. Although so low in the scale of plant life these constitute a very respectable part of the vegetable kingdom, since more than forty thousand species have been described.

There are about two thousand species of mushrooms in America. Some of these are known from only a single state, while others are distributed throughout. Formerly all were classed in the genus Agaricus, but owing to the differences which exist in such a multitude, they are now placed in five groups according to whether their spores are white, pink, vellowish, brown or black. Each of these groups contains one or more genera. The student who turns his attention to this assemblage of plants will find a greater diversity of characteristics than he might imagine from a cursory examination. In color it includes species with scarlet, violet, yellow, green, orange, white, brown and gray caps. In texture they are leathery, tough, brittle, fleshy or watery. Some are tasteless, others are bitter, peppery, mealy, or with a nutty flavor. In odor some are repellant while others have various pleasing odors "like ripe apricots," anise, etc. The genus *Lacturius* is peculiar for having a milky juice that in different species is white, orange or even blue. This juice is often acrid. In one species it is so much so that it is said to sting a tender skin like nettles.

In spite of the dangers that hedge round the pleasures of the mycophagist—as the mushroom eater likes to be called—these plants have been used more or less for two thousand years. The people of China, Italy and France are among the chief consumers of mushrooms. It is said that the city of Rome now uses about thirty tons annually. When a person speaks of the mushroom, Agaricus campester is the one usually meant. It is the commonest species in cultivation and is also abundant in the wild state being found in pastures and other grassy places but seldom if ever in the woods. The cap is usually white and the gills at first a beautiful pink, changing later to brown.—American Botanist.

# Our Native Birds' Protectorate

Under the Direction of the Committees on Bird Protection.
National Association of Gardeners, L. H. Jensen, St. Louis, Mo., Chairman.
American Association of Park Superintendents, Herman Merkel, New York, Chairman.

# APPLIANCES FOR ENCOURAGING THE RETURN OF THE BIRDS.

Now that the great battle has been fought and won for the legal protection of our smaller birds—known collectively as song birds, although many do not sing—the question arises as to how best to help them to regain an approximation of their former abundance. Examination of the conditions brings to light the fact that actual persecution at the hand of man has not been the only cause of the diminution of birds. This direct method has been complemented by a far more insidious means, and one which cannot be so easily combatted.

When the colonization of America commenced, it is easy to imagine that some stimulus may have been given to certain small birds—more especially those which habitually nested in hollow trees, and excavations in dead stumps. The clearing of ground, which left many stubs, and the establishment of orchards, meant a great multiplication of nesting sites and an increase of feeding grounds for those species which preferred open country. But with the density of population constantly increasing, more care was devoted to the conservation of forests, and today the application of modern forestry methods has so trimmed the branches of the old orchards, and so carefully removed all dead or decayed forest trees, and insect-harboring undergrowth, that many of our useful birds are hard pressed indeed to find a cranny in which to deposit their eggs, or cover in which to search for food.

The red-headed woodpecker, once common about New York, is now rarely seen, and for the first time in many years, a pair is nesting this spring in the Zoological Park. European starlings and sparrows occupy the few remaining holes suitable for the nests of bluebirds and, excepting during the migration period, the querulous notes of this beautiful songster are wanting from our parks and suburbs.

Since it is evident that this condition has been brought about directly by us, it is equally obvious that it rests with us to remedy it as far as lies within our ability. Fortunately the means is at hand, and its application is of direct and permanent value to many of the birds we most desire to benefit.

Suitable nesting boxes are available and can be substituted for the vanished dead limbs, and various devices have been originated for holding food to help the little feathered winter visitors maintain themselves. Even during the summer months, when food is more abundant, a few birds will be found visiting the food depots. For the purpose of disseminating knowledge concerning the use of such apparatus, the Zoological Society has established an exhibit of these contrivances in the Park.

About New York, the birds most likely to be attracted to food depots are the following: Blue jay, downy woodpecker, hairy woodpecker, flicker, nuthatch, brown creeper, chickadee, white-throat sparrow, song sparrow, tree sparrow, junko, sistine, purple finch and possibly the cardinal and tufted titmouse. Woodpeckers and nut-

hatches will visit the suct chiefly, blue jays will eat almost anything. For the finches, a mixture of various seeds should be provided—sunflower, hemp, canary and millet are among the best, although any nourishing, assimilable grain will do. Bits of dry bread and nut meats are relished by many birds

There can be no doubt that suitably placed bird houses are a very potent factor in the encouragement of birds. If the locality is at all favorable, and a little thought be given to construction and especially to location, it will be found that birds will take possession of them. It is a strange fact that while birds will frequently ignore elaborate structures, they often will unhesitatingly occupy the most unpromising cavities. Empty cans, old hats, and the roughest of boxes, seem to offer all that the home-seeking bird desires. Hence, it follows that any boy can build suitable bird boxes for himself that are as likely to be found acceptable as any others. Those who lack the time or ingenuity for this work, will find the market well supplied by a number of manufacturers.

Of single nest-boxes for small birds, there is great diversity of style, but after all there are but two main types—the hollowed natural log and the artificial house of boards. These logs certainly offer the closest approximation to natural nesting sites that can be produced, and birds take to them with confidence. It has been found, however, that in many cases artificial houses have proved even more satisfactory.

The birds which are likely to occupy houses in the vicinity of New York are the following: Bluebird, crested flycatcher, purple martin, tree swallow, chickadee, flicker, house wren, starling, European sparrow, sparrow hawk, screech owl and possibly also the nuthatch, Carolina wren, tufted titmouse and downy woodpecker. Robins and phoebes will nest on open shelves, which can be provided with a rim to hold the nest and a simple roof for shelter. Starlings and sparrows, unfortunately, nest in holes, and their pugnacious dispositions are too much for the smaller native birds. The bluebird can be protected from the starling by making the entrance holes one and one-half inches in diameter, which is too small for the latter. It will not, however, exclude the sparrow. Martins like entrance holes at least two inches in diameter, but can squeeze through one and one-half if they will. Chickadees and wrens are protected by holes seven-eighths to one and one-eighth in diameter.

Some discrimination must be exercised in placing boxes according to the habits of the birds that they are expected to attract. Bluebirds are most likely to nest in an orchard, or rough pasture, although they will often come close to houses. This applies also to flickers, crested flycatchers and chickadees. Wrens will nest in boxes attached to buildings, or placed on poles nearby. Tree swallows will occupy boxes a few feet above the ground, on poles, especially where it is marshy, and martinhouses should always be entirely in the open, well away from trees. In general, boxes should be placed from six to twenty feet from the ground, and those on poles or in isolated trees are more likely to be occupied than those situated in thick woods.

# Producing Natural Effects in Conservatory Planting

By W. W. Ohlweiler, Missouri

The arrangement of the plants in large conservatories is influenced by a number of factors whose ultimate influence, if we may judge from examples of large conservatory plantings in this country, tends to bring out the artificial character of the surroundings. these examples there are notable exceptions such as the fern house at Garfield Park, Chicago, and parts of a number of other conservatories throughout the country. In general we know that the dominance of the greenhouse structure together with the formality of the walks, of the benches, and of other artificial features, all tend to make the work of "landscaping" a greenhouse interior a rather difficult proposition. Just as the landscape designer is often called upon to plan for the improvement of a poorly located building, so the grower of greenhouse plants is often called upon to do impossible things with impossible buildings. Of course commercial ranges are exceptions as a rule; but conservatories are, unfortunately, usually built first and the planting arranged for afterward. The work on greenhouse interiors is still more difficult because of the nature of the plants to be used. Palms and other tropical plants are usually not available in the sizes or in the quantities that outside plants are, and furthermore their beauty only becomes apparent when after decades of growth they begin to approach their maturity. And then possibly their maturity is prevented because of the insufficient height of the house. The greenhouse always places certain limitations on the extent to which tropical specimens may be developed; and for this reason the conservatory should be planted primarily for the few specimens which it is to contain when they have reached their maturity. are familiar with the large Phoenix at Washington Park conservatories, or the large Attalya at Fairmount Park, must have been impressed with the size to which palms will grow under cultivation and will take good care that such palms as they are fortunate enough to plant are fortunate enough to have room in which to grow. There comes to my mind, as I write, a certain small conservatory, perhaps thirty-five feet high, where two Latanias are beginning to take the roof off, and where the owner is contemplating cutting them down in the spring to save the houses! Less than a year ago we were presented with a large Cocos Romanzoffiana and a large Arenga Saccharifera that were becoming too large for a forty-five foot house. former was growing in the open and has not apparently recovered as yet; the latter however was growing in a tub and is now doing well. So before planting out our conservatories it might be well to stop a moment and consider a little of what the future may have in store for the plants we use, so that when they reach their good old age, and we too reach the years of plenty, we shall not be forced to destroy them because we have not been far sighted enough. So then let me repeat that we must construct our conservatory for the plants which it is to contain, or else we must use pretty good judgment in our selection of the plants we put into it. The arrangement of the average conservatory is usually governed by the amount of money at the disposal of the builder, and the design of the house, the arrangement of the heating pipes, etc., are designed according to cost. False notions of economy of space, of heat radiation, are responsible for many objectionable features of modern conservatories. Certainly the arrangement of the walks, or the location of the heating systems, should not be such as to make for formality.

The placing of the heating pipes in a conservatory determines to a certain extent the location of the walks. Usually the walks follow the outlines of the house with the heating pipes at the outer edge of the walk or directly under them. This means the location of the plants in the central area. This system is usually advised because the lowest part of the greenhouse is usually at the sides and at the ends and by locating walks at these points but very little headroom is lost to the plants. Then again it is argued that walks in the center of the house take up valuable planting room. The correctness of this point of view is very much to be doubted. Walks through the house certainly do not prevent the development of plant roots under them, or the development of foliage above them, and an overarched walk is one of the beauties of any greenhouse. Radiation of heat directly from the pipes either under or at the sides of the boundary walks is neither comfortable for visitors or healthy for the plants. Another objectionable feature of outside walks is the tendency to mass the larger palms and tropical plants in the center of the house where they are not easily seen. certainly nothing is more annoying to the plant lover than to be forced to observe a good specimen at a distance when the walk might just as well have carried him near it.

In the new conservatories of the Missouri Botanical Garden many of the objectionable features mentioned above have been eliminated. This has been made possible largely because the particular type of construction used gave a very high arched roof which had the advantage of permitting the planting of large specimens within a very few feet of the outer edge of the conservatory. Furthermore, the heating pipes were all located on the boundary wall and do not extend from the wall over fifteen inches, and do not project above the foundation sill, which is about three feet higher than the door sills of the house. In order to prevent lateral radiation directly from the pipes a concrete wall was built entirely around the conservatory next to the pipes. This wall extends from the floor level, which is that of the door sills, to the height of the foundation sills, and is strong enough (four inches thick) to withstand the pressure of the earth piled against it. The earth in the house was graded from the floor level to the top of this protecting wall in most cases and gave a distinctly pleasing variation in the elevation of the surface and with the planting helped to hide the side walls of the house from the interior. Except at a very few points the heating pipes cannot be seen, yet they are easily reached in case of necessity. The walls are not reinforced. In a few houses the grade of the surface is carried considerably below that of the door sills but it is always carried up to the top of the protecting wall near the heating pipes.

The walks in all the houses with the exception of that of the floral display house are four feet wide, and connect one house with the other by pleasing natural curves. The walks are made of cinders about eight inches deep, being finished at the surface with the same material screened, and top dressed with yellow sand. The walks are bordered with porous limestone and the soil at the edges of the walk is always a little higher than the walk itself. This walk, which now has been down a little over

a year, has never been muddy and has never required more than an occasional sweeping and another dressing with sand. It is always damp and cool and agreeable to walk upon, and while it requires more attention than brick or concrete, its perfect harmony with its vegetative surroundings more than compensates for this. In the flower house, where people linger somewhat longer than in the other houses, a brick walk has been laid with sand foundation and sand between the bricks. This retains sufficient moisture and blends well with the various floral exhibits. The floral house is intended to be somewhat more formal than the other houses and the walks help to maintain this effect.

In planting the palm house, which is the largest of the whole range, two features have been kept in mind. First—to keep open the vistas on both axes of the house, and second—to have all the large specimens at a very short distance from the walks. Reference to the illustrations in The Gardeners' Chronicle, January issue. will show the total absence of large specimens from the open vistas and will also show the prominence of the taller plants near the walks. In time the canopy may be formed above the vista but below it will always be open and attractive. These canopies will also form and indeed are already forming above the walks. Labels have been placed on all the prominent specimens and in every case are easily read from the walk itself. These labels contain general information in regard to the economic use of the plants, their native habitat, common and scientific name. It would take too much space to list the many species of palms and other interesting plants that are in this and the other houses, but they are fairly completely listed and described in the Missouri Botanical Garden Bulletin for November, 1913.

The collection of economic plants has been treated in the same manner and persons can see and examine from a very short distance many of the economic plants from the tropics. These have been grouped so as to show the fruits, the medicinal plants, the fibres, the gums and resins, the condiments, the perfumes and the tropical woods. Tropical climbers are beginning to make their appearance on the rafters of all the houses and add much to the general appearance. The massing of plants close to the walks and forming high green walls gives a tropical aspect that is none too common in modern greenhouses. All the plants are planted out in the ground, and this is true of every house except the floral display house. In this connection it might be well to add that much care has been taken in preparing the soil for the houses. After the builders were through with the construction there remained a fill of from five to twelve feet throughout the range. This depression was filled entirely with a soil composed of a mixture of compost and well rotted manure. The compost was obtained from an accumulation of nearly twenty years vegetable matter, refuse from potting benches and emptied benches, etc. In fact it contained nearly everything except stones and rock. To this mixture was added a generous amount of crushed bone. When finally prepared the soil had the consistency of medium heavy loam. The houses were filled by means of three dump cars on tracks. A mule team and the aid of gravity helped materially in getting the houses filled. Some 3,000 yards of soil was required for the houses. The subsoil is in all cases a very heavy clay, and to insure good drainage four-inch porous drain tile was laid in runs about twenty feet apart throughout the

The floral display house occupies the southern wing of the range, and is particularly suited for this purpose because of the excellent view that may be obtained from the top of the stairway leading into it from the economic house. The masses of the larger flowers such as the chrysanthemums, the azeleas, the rhododendrons, cinerarias and hydrangeas, are particularly effective from this vantage point. The floral exhibits are continuous throughout the winter months, and are only replaced during the summer by the foliage plants such as caladiums and coleus and others, because the outside displays take their place. The grade of the house is flat and the variation in outline and the massive effects are obtained by the use of benches and stages. The house is about 145 by 33 feet and offers some opportunity for striking effects.

The three houses that have just been referred to offered no particular constructive problems, but represented more problems of arrangement. The fern house and the cycad house, which correspond to the economic and the flower house, respectively, in size and relative location, were entirely different problems. Ferns are most pleasing when they may be observed from all angles, but are particularly attractive when seen from above. This effect may be easily arrived at when the plants are small by planting them along the walks. But when the plants are large specimens of Alsophila and Angiopteris the problem is somewhat different. There is, too, the decided advantage of breaking the monotony of the houses by sudden changes in the plantation and the elevation. This may easily be effected when going from one house to another, just as it is practised when changing direction in outdoor planting. Much the same sort of effect is produced when entering the fern house as is offered when entering the flower house, but there is a change in the type of plant. A platform with a rustic bridge leading away from it over the little valley below is the main feature of the house. The valley extends the length of the house and the sides extend to the sills of the house. The slopes are planted with nearly 200 species of ferns and some of these trail in the pools at the bottom of the valley and in the little stream connecting them. Immediately under the entrance to the house a grotto was constructed of porous limestone rock. This takes up little room that could be available for plants but forms an ideal background for the rustic work that surmounts it and for the stream that has its source near it. It also forms an ideal place for the growth of many young ferns and for a number of liverworts and mosses.

From the fern house one enters the north wing or the cycad house. The same problem for the display of the plants is met with here as in the fern house and is solved in the same manner, i. e., by depressing the central portion of the house and planting the sides. The use of the pools and waterfalls has been continued. The arrangement of the walks and the arrangement of the hills and pools is different. Here the Japanese type has been aimed at and the effect is intensified by the use of granite boulders and the use of the little island and the small arched stone bridges. The effect will be still further increased by the addition of Japanese lanterns and the use of stepping stones in the walks. The collection of cycads in these houses is complete in generic representatives and contains some very large and beautiful specimens. The form of the house and its immense length in comparison with its breadth help to intensify one of the peculiar characteristics of the Japanese gardens, i. e., distance. This distance is further intensified by the use of the taller plants in the foreground and the use of the smaller plants in the distance. The nearer hills are the larger also and when the stepping stones are placed the larger one will also be in the foreground.

AUGUST, 1915.

No. 8.

The remarks of President-elect Gray, of the American Sweet Pea Society, suggesting co-operation between the professional gardener and the amateur gardener, and that the professional gardener be the one to extend the helping hand, are most timely, and should be carefully pondered over by all who have the interest of horticulture at heart. We have frequently been severely criticized for endeavoring to form an alliance between the professional and amateur, and so we are doubly pleased to have this notice come from a man who stands among the foremost in his profession. He speaks with authority, for he and the local society with which he is prominently identified have had much experience both with amateur growers and with garden clubs and which has resulted in mutual benefit to all concerned. The time is now most opportune to encourage and spread co-operation between the professional and amateur gardener for the purpose of arousing a more widespread interest in

ornamental horticulture in America, the accomplishment of which must result in greater opportunities for those engaged in the profession of gardening.

The account appearing in the July Chronicle, of a visit by a number of gardeners to a private estate on the invitation of the owner, has evoked the suggestion from several sources, that such "outings" not alone prove entertaining but instructive and that their more frequent happenings should be arranged for. In and about Boston "Field Days" among the gardeners have been popular for some time past, and during the season visits are made to the private estates and also to commercial establishments where there may be something of interest to observe for the gardener. We have also read of a similar practice on the Pacific Coast, but it has not yet been introduced about New York and elsewhere. The outing to Homewood was appreciated by those who participated in it. The opportunity presents itself for some one else to extend the invitation for a Field Day out of New York. We feel sure that the response to it will not be disappointing, whether it comes from estate owner or manager, or commercial establishment.

### THE LATE CHARLES L. SHEPPARD.

It is with deep regret we have to record the passing of Charles L. Sheppard, head gardener to Mrs. P. Cooper Hewitt, of Tuxedo Park, N. Y., on June 16, after a brief illness. The news of his demise came as a great shock to the gardeners and his friends of Tuxedo Park. He was the only son of Mr. L. Sheppard, head gardener to Viscount Gage, of Finle Place, Sussex, England, with whom he received his early training as a gardener. After coming to America, he secured a position as greenhouse assistant at Castle Gould, Long Island, until two years ago, when he came to Tuxedo Park as an assistant to Mr. William Hastings. Shortly after that time Mr. Sheppard secured the position he held at the time of his death. He was still a young man, 29 years of age, and on November 1 of last year he married Miss B. R. Turner, of Luton, Bedfordshire, England, and to whom the sympathy of all his friends is extended at this the hour of her sad bereavement. He was a very active member of the Tuxedo Horticultural Society and was ever willing to shoulder any duties assigned to him. He was also a member of Tuxedo Cricket Club, and was prominent in the affairs of the Men's Club of St. Mary's Church, and a member

On Sunday, June 20, the Tuxedo Horticultural Society turned out in a body to attend the special memorial service in St. Mary's Church, conducted by the Rev. R. S. Wood, of Tuxedo. Interment took place in Evergreen Cemetery.

### THE LATE DAVID ROSE.

Another of the old-time gardeners of Tuxedo Park has passed away in the person of David Rose, on June 18, after a very severe attack of pleura pneumonia, which lasted but a few days. He was 63 years of age. Mr. Rose was gardener on the Price Collier estate for many years and was very well known and much respected in the district. He had the reputation of a good vegetable grower, who prided himself on some of his produce and was also a great enthusiast on bees. Up till the last he spent much of his spare time in nature's study, in which he was very interested and had made it a life hobby. Mr. Rose left a widow and grown-up family to mourn his loss. Internment was in Sloatsburgh Cemetery.

### NATIONAL ASSOCIATION OF GARDENERS

JOHN W. EVERITT, President, Glen Cove, N. Y.

OFFICIAL COMMUNICATIONS

M. C. EBEL, Secretary, Madison, N. J.

### ASSOCIATION NOTES.

The eventure meeting of the trustees and hoard of directors was held at the Hotel Martinique on Wednesday, July 14, with the following members present: J. W. Everitt, Glen Cove, N. Y.; Wm. Kleinheinz, Ogontz, Pa.; John F. Huss, Hartford, Conn.; Arthur Smith, Reading, Pa.; James MacMachan, Tuxedo Park, N. Y.; Anton Bauer, Deal Beach, N. J.; John Johnston, Glen Cove, N. Y.; M. C. Ebel, Madison, N. J. The meeting was called to order with President Everitt in the chair.

Messages were received from George W. Hess, Washington, D. C. and Theodore Wirth, Manneapolis, Minn., regretting their

inability to attend.

The rep rts submitted by various committees all showed good progress within the association, and the treasurer's report showed a good financial balance.

President Everitt named the following committee to select a suitable design for the association's new medal: William Kleinheinz, P. W. Popp, John Johnston.

It was voted to send an official communication to delinquent members that unless their indebtedness to the association is paid by September 6 they will be dropped in pursuance with the by-laws.

The secretary was instructed to draw up resolutions for an amendment of the bylaws to present at the annual meeting, that members two years in arrears for dues shall be suspended, instead of three years as the bylaws now provide; also that a member six months in arrears shall cease to receive the official organ until his dues are paid.

The secretary was also instructed to acknowledge receipt of the inviation received from the American Association of Park Super-intendents inviting the members of the National Association of Gardeners to join them on their trip to the Pacific Coast, and to extend the thanks of the committee for the same.

It was voted to hold the annual convention this year, which

occurs the first week in December, in Boston.

The committee voted that the association's silver medal be offered to the Menlo Park Horticultural Society. Menlo Park, Cal., for its Fall show, to be awarded to a member of the National Association of Gardeners in a class to be designated by the local society.

The summer meeting, to be held in San Francisco in the middle of August, was discussed, and the majority of the members present expressed disappointment that conditions have become such as to prevent them from making the trip to the Pacific Coast at this time, which most of them had counted on when the meeting was proposed for San Francisco last year.

The essay committee requests the following publicity for the contest of the President Everitt gold prize.

Contestants must have their essays in the hands of the chairman, Wm. II. Waite, P. O. Box 290, Madison, N. J., not later than October 1. The essay must be signed with a nom de plume, must bear no evidence of the author's identification, and be mailed in a plain envelope, carefully addressed to the chairman of the committee.

The contestant will place his name and full address, stating the position he holds, in a separate envelope, writing the nom de plume he signed to his essay on the outside of this envelope, and mail same in a separate envelope to M. C. Ebel, Secretary, National Association of Gardeners, Madison, N. J. This envelope is not to be opened until the judges have rendered their decision on the contest. Write your essay distinctly and use one side of paper only. These rules must be strictly followed to avoid disqualification. The subjects have been arranged in four classes, as follows:

CLASS 1 Prize 835 gold.

Subject Hartredture as a Profession, From the Standpoint of a Gardener.

CLASS 2 -Prize 825 gold.

Subject—The Proper Grouping and Culture of Trees, Shrubs, Percentials and Annual Bedding Plants in the Ornamentation of Private Grounds,

CLASS 3 - Prize 820 gold.

Subject—Preparation of Ground for and General Treatment of Hardy Herbaccous Perennials. Naming a list of species (limited to one hundred) providing a succession of flowers throughout the entire season.

CLASS 4—Prize \$20 gold.

Subject How to Secure a Year's Venetable Supply With the Aid of Cold Frames or Hotbeds (but no Greenhouses), Including Soil Preparation. This essay competition is open to professional gardeners who are engaged in the capacity of superintendents, head gardeners or assistant gardeners.

A competitor is entitled to enter in one class only,

The broadest latitude will be allowed in dealing with each subject.

The essays are limited to 3,000 words each.

The contest will close on October 1, the judges to report their decision at the next convention of the association, to occur the first week of December.

The Essay Committee will appoint five judges, consisting of three gardeners and two representatives of the horticultural press. Contestants will address William II, Waite, Chairman of Essay Committee, National Association of Gardeners, P. O. Box 290, Madison, N. J., for further particulars.

The National Co-operative Committee has endorsed the resolution to it by the co-operative committee of the Nassau County Horticultural Society, recommending that members moving from one district to another be accepted through transfer from the local society with which they were affiliated by the society in the district to which they have removed, and will submit it to the different local horticultural societies for action when they renew their meetings in the fall. The resolution follows:

Your committee on co-operation having been instructed to present a draft of a plan on co-operation or affiliation of gardening societies, with a view to evenlying a stronger feeling of good-fellowship amongst members of such societies, beg to submit the following for consideration.

A member of a horticultural society, such as the Nassau County Horticultural Society, removing to another locality, and being desirous of associating homself with the horticultural society in the locality to which he has gone, should become eligible to full membership therein if he is in good standing, without the payment of dues to the end of the pseal year, and vice versa. In other words, he would simply be transferred from one society to another without any extra monetary charge whatsoever.

It would make it so that a stranger could enter a society in his new location, and, presenting a letter or identification eard, to the secretary of that society from the secretary of the society from which he was leaving, would be introduced to the members and made to feel at home.

Believing that this plan can be more widely circulated and can ried out by the National Association of Gardeners, your committee recommend that this society refer the matter to that body, and if acceptable to them, to have the National Association of Gardeners carry out the plan. (Signed)

JOHN JOHNSTON, 84MUEL J. TREPESS, ERNEST WESTLAKE,

Local Comperative Committee Vassay County Horticultural Society.

The chairman of the Committee on Our Native Bird Protection advises that he will call a meeting of his committee, to meet with the committee of the American Association of Park Superintendents, at San Francisco during the convention there, to formulate plans for future united action.

The summer meeting of the association to be held at San Francisco during the week of August 16 will be at the call of Vice-president William S. Rennie, who has charge of arrangements for the meeting. The headquarters of the association will be at the Stewart Hotel, Union Square

### AMONG THE GARDENERS

George Wittlinger has resigned his position as superintendent of the Miss Blanche Potter Estate, at Ossining, N. Y., to accept a similar position on the Fuller Estate, Briarcliffe, N. Y. Mr. Wittlinger assumed his new duties on August 1.

Edward Davies, until recently gardener for Paul Moore, Convent Station, N. J., has been appointed superintendent of the W. H. Wellington Estate, Wayland, Mass. Improvements are now under way on that estate, which include à new range of glass.

Arthur C. Ruzicka, who was gardener on the estate of C. Oliver Islin, Glen Head, N. Y., has resigned his position to engage in commercial work, to take charge of a rose growing establishment at Murray Hill, N. J.

William Kleinheinz, gurdener of the Widener Estate, Ogontz, Pa, and Mrs. Kleinheinz announce the marriage of their daughter Anna to Charles A. Mitchell. The happy event occurred on Tuesday, July 27.

Among the gardeners who have declared their intention, up to this writing, of joining the American Association of Park Superintendents in its trip to San Francisco are: Robert Williamson, Greenwich, Conn.; A. Bieschke, Noroton, Conn.; David F. Roy, Marion, Mass.; Oscar W. Karlson, Riverdale-on-Hudson, N. Y.; John F. Walsh, New York. Mesdames Roy and Bieschke will accompany their husbands. It is hoped that the number of gardeners will be materially added to as the party proceeds westward. M. C. Ebel, secretary of the National Association of Gardeners, will be one of the party.

### AMERICAN ROSE SOCIETY.

The executive Committee of the American Rose Society met at the office of President, S. S. Pennock, Philadelphia, Pa., on Tuesday, July 20.

The Hartford Rose Garden Committee, consisting of Messrs. John F. Huss, Wallace R. Pierson and Alex.

Cumming, Jr., report:

"On the 25th of June the new Roses of the test garden at Elizabeth Park, Hartford, Conn., were closely examined and silver medals were awarded as follows:

Conard & Jones Co., West Grove, Pa. - Climbing American Pillar Rose. -Awarded a silver medal. Scored 85 points. Highly recommended as a pillar rose.

A. N. Pierson, Inc., Cromwell, Conn.-Killarney Queen, Hybrid Tea. Awarded a silver medal. Scored 85 points. Recommended

as a grand bedding 10-c.

Hoopes Bros. & Thomas, West Chester, Pa. Purity, Hybrid Wichuriana.—Awarded a silver medal. Scored 87 points. A splendid grower that is recommended for every collection and garden.

Hoopes Bros. & Thomas, West Chester, Pa. Climbing American Beauty.—Awarded a silver medal. Scored 87 points. profuse bloomer, deserving to be recommended for every garden.

Hugh Dickson, Ltd., Belfast, Ireland.—Lady Pirrie, Hybrid Tea.—Awarded a silver medal. Scored 85 points. Recommended as a splendid bedding rose.

Edward Kress, 2506 North avenue, Baltimore, Md.—Registered as Defiance, Hybrid Tea.—Scored 85 points. Highly recommended

as a most excellent bedding rose.

"There have been added a number of new varieties of American origin this spring which will be watched with great interest in the future, and more are promised for the planting in coming fall. Much interest has been especially devoted to this Test Garden by the lovers of Roses, and the garden has been unusually well visited this summer.'

JOHN F. HUSS, WALLACE R. PIERSON, (Signed) ALEX. CUMMING, JR.

The National Flower Show to come off in Philadelphia next spring is gaining a good deal of attention and interest from the rose growers around Philadelphia.

The Cleveland Rose Show was discussed and the advisability of holding a meeting in that city during the show was advocated and a motion made to that effect, BENJAMIN HAMMOND, Secretary. carried.

### GLADIOLUS SHOW AT ATLANTIC CITY.

All arrangements are now perfected, and as it may be of interest to all Horticulturists, the committee deemed it proper to submit the following:

The show will be held at the Royal Palace Casino,

situated on the Boardwalk.

The dates are August 26, 27, 28, and 29. The exhibition will be from 10 A. M. to 10 P. M.

Every afternoon of the first three days a lecture will be given.

- (1) By Mr. Max Schling, of New York, entitled, "How to Arrange Flowers Artistically.
- (2) By Mr. Arthur Cowee, of Berlin, N. Y., entitled, "The Varieties of Gladiolus.
- (3) By Mr. Maurice Fuld, of New York, entitled, "How Best to Grow the Gladioli by the Amateur."

Every evening, from 8 to 10 o'clock, musical selections will be rendered by Schwab's Orchestra.

The hall has been spaced into so many spaces, each measuring 20x6 feet, which constitutes the exhibition space. Every exhibitor must try to break away from the old methods of exhibiting, and show his flowers in an original and artistic way, so that the entire show will be a thing of beauty. Exhibitors are charged rental of \$20 for each space, but the committee pledges itself to refund this amount if the returns from the show warrant it. A number of spaces are unengaged, and applications should be made at once to Maurice Fuld, No. 1 Madison Avenue, New York City.

The committee is confident that, if the weather conditions are favorable, our show will draw an attendance of 100,000 people during the four days, so that the exhibitors have a splendid guarantee of making their exhibit

The entire week will be known in Atlantic City as Gladiolus Week. This has been originated by the Publicity Bureau and the Hotelmen's Association of Atlantic City, who are co-operating with our committee to make our show a tremendous success

> Special Exhibition Committee. MAURICE FULD, Chairman. Mrs. B. Hammond Tracy, Mr. Arthur Cowee, Mr. Geòrge W. Kerr.

### AMERICAN DAHLIA SOCIETY SHOW.

At the Museum of Natural History, New York City, September 24, 25, 26, 1915, we expect to have the greatest variety and best collection of dahlias ever gotten together anywhere in all their different types and classes. New seedlings and some of the newer varieties that have been either grown here or imported and not hitherto exhibited. will be shown for the first time at this meeting. There will be some seven hundred or eight hundred varieties grown by Prof. F. H. Hall, of the New York Experiment Station at Geneva, with other trial and experiment lots from other sections. We shall aim to have some one present who will explain the planting, growing and handling of dahlias for the garden. The Executive Committee have requested the retail florists to put up an exhibit of their decorative art and skill in showing the possibilities of this beautiful, many colored and exquisitely shaped flower. Each and every one will be given space free of charge to put up whatever they wish in table decorations, bouquets, baskets and vases of any design that will show the possibilities of the dahlia for ornamental and design work in its season.—RICHARD VINCENT, Jr., President.

### MORE PROMISING FOR THE FUTURE.

Biffkins—Has our congressman done anything for the district?

Wilkins—He sent us nothing but seed this season, but next year he promises we'll get spades, rakes and garden

### AMERICAN ASSOCIATION OF PARK SUPERINTENDENTS

OFFICIAL COMMUNICATIONS.

G. X. AMRHYN, Pres., New Haven, Conn.

R. W. COTTERILL, Sec.-Treas., Seattle, Washington.

### ASSOCIATION NOTES.

At this writing (July 27) it looks as if we would fail to have the 100 passengers necessary for the special train from Chicago to San Francisco.

In the event that this happens the party will be assigned to specal cars attached to regular trains, and the only material change in the itinerary announced will be as follows: August 12 leave Spokane at 8:15 p. m., instead of at midnight; arrive at Seattle on the 13th at 8:45 a. m. instead of at noon

An error occurred in the preliminary announcement as to the date the party will leave San Francisco, which will be at 8 p. m., on the 25th, in lieu of 7:45 a. m. on the 22nd, as announced. The transportation committee changed their minds in this particular, and overlooked advising the secretary, hence the mistake.

Present indications are that about 75 people will join the special party via the Pacific Northwest. Chairman Merkel, of the transportation committee, has a party of 25 signed up from the New York district, and at least 50 others will join the party

at Chicago, Minneapolis and points westward.

Returns in the hands of the secretary up to July 28 show that the following will be in the party: G. X. Amryhn, of New Haven: Fred C. Green, of Providence; Miss Una Keith, of Bridgeport: Hermann Merkell, John D. McEwan and J. J. Levison, of New York; M. C. Ebel, of Madison; all starting from New York. At Chicago there will be H. S. Richards, J. H. Prost, Walter Wright, Theo. Gross, of Chicago; Alex Fiske, of Racine; Dan H. Ellis, of Saginaw; Eugene Goebel, of Grand Rapids; E. P. Griffin, of East St. Louis. At Minneapolis there will be Theodore Wirth, C. A. Bossen, L. P. Jensen, of St. Louis; C. B. Wolf, of Hibbing, Minn.; Geo. Champion, of Winnipeg, and several new members which Mr. Wirth is lining up. At Spokane there will be J. W. Duncan and Carl Fohn, of Colorado Springs. with possibly several others of the Colorado delegation. At Seatthe there will be J. W. Thompson, R. W. Cotterill and several new members, including W. R. Reader, of Calgary; W. S. Rawlings, of Vancouver, and John Gibson, of Bellingham. At Portland E. F. Mische and Jas. O. Conville will join the party. F. S. Mulford has been migrating on the Coast for some time, and will join the party at the convention. This list is not complete, and there are many who are going by direct route to San Francisco, and will make the return trip with the party.

Here is briefly what the party may expect in the way of entertainment at stop-over points en route

At Chicago: Eastern party will be met at trains and taken for all day auto tour of all boulevards of the Lincoln, West Park and South Park systems, with luncheon served at Lincoln Park. Party delivered back to train for Minneapolis at 6:30 p. m.

At Minneapolis: Party will be met at train at 8 a. m., and taken to breakfast at Elks Club. Then off on all day auto tour of all boulevards and parks, nursery, bath-houses, etc. Paving plant and dredger plant in operation will give demonstrations. Luncheon at Minekalıda Club. Supper, Minnehala Park, and special evening concert at Lake Harriet Roof Garden; then the autos to the train. Mr. Wirth and the Minneapolis Park board, with their famous spirit of hospitality, have planned something for every minute of the stay in the city, and it will sure be one big day.

At Spokane: No information at hand at this time, but J. W. Duncan is working on a day's program that will not be lack-

ing in any respect.

At Seattle: Autos will be at train for all day auto tour of parks and playgrounds, and the scenic Lake Washington Boulevard system, with steamer ride on Lake Washington, picnic lunch at Woodland Park, informal dinner at Scattle Commercial Club, and evening theatre party.

At Tacoma: Party will be met at steamer from Seattle, and taken for afternoon auto ride, with picnic supper in the famous

Point Defiance Park. Evening free.

At Portland: Party will be met at train by autos, then off on auto tour of the new Columbia River Scenic Highway, along which is leated the 14,000 acre reserve recently turned over to Portland Park system by the United States government. Luncheon will be served en route, and party returned to evening

There will be quite likely a lively contest in connection with

the choice of place of next meeting. Inasmuch as there has been quite an expression in previous years that we should hold a convention in the South, several southern cities are going to get busy this year.

St. Louis was the first to send in an invitation, then came Memphis with a bunch of documents from all officials from the governor down, and then came New Orleans with all sorts of credentials, and they will also have representatives at the convention to press their claims, something they have never had before. There is a possibility that Chicago will also extend an invitation.

The Special Park Commission of Chicago comes to the front this year by sending its superintendent, J. H. Prost; secretary, Walter Wright, and superintendent of playgrounds, Theo. Gross, to the convention. South Park used to be the whole show in Chicago in this respect, but this year they have taken a back seat

Here is just a little tip to those who attend the convention. The people of San Francisco are rather sensitive about their city being called "Frisco," and don't like the abbreviation a little bit, so remember it is San Francisco.

The secretary at this time has ten applications for membership in his hands, five of which he secured himself as per promise We hope that our members are coming to the convention with signed applications in their pockets, as we need more members.

### PROPOSED AMENDMENTS TO CONSTITUTION AND BY-LAWS.

Article 1, Section 1. To be amended to read as follows: Section 1. The name of this organization shall be The American Park Association.
Article 2, to be amended to read as follows:

### ARTICLE H. MEMBERSHIP.

Section 1. The Association shall consist of Senior, Jnior, Associate, Sustaining and Honorary members.

Section 2. Senior Members. A Senior member shall be a person of at least five (5) years' practical experience as superintendent, assistant superintendent, landscape architect or engineer, forester or other park executive of a public or private park or park system, or a specialist in arboriculture or forestry, or whose chief employment shall be as engineer or designer in the creation Training, experience and ability shall be prime requisites to entitle applicants to recognition as Senior members, and all applications must be approved by the executive committee.

SECTION 3. JUNIOR MUNIERS. Qualifications for Junior membership shall be the same as for Senior members, except that five years' experience or service shall not be required. Persons admitted as Junior members may become Senior membrs at such time as they can qualify, by making application, approved by the executive committee, at any annual session, and if approved, shall be classified thereafter as Seniors.

Section 4. Associate Members. Park commissioners, secretaries or other officials directly connected with park or recreational work or persons interested in or connected with horticulture who may be deemed desirable as members, shall be eligible as Associate members, subject to approval of executive committee and annual convention: provided, that officials shall cease to be members one year after retirement from public service except as otherwise provided herein.

Section 5. Sustaining Members. Park commissions or other governing bodies, which contribute ten dollars (\$10) annually to the Association, shall be enrolled as Sustaining members, and shall be entitled to the publications and information service of

the Association.

Section 6. Honorary Members. Persons who have by their work or writings greatly furthered the interests and objects of the Association, may be designated as Honorary members, upon unanimous recommendation of the executive committee and unanimous approval of the annual convention.

Section 7. All applications for membership shall be submitted to the executive committee for recommendation, prior to submission to the annual convention for acceptance or rejection. The president and secretary shall, however, be empowered to accept

and enroll Sustaining members at any time.

Section 8. Senior or Junior members, who may retire from public service and take up other professions, shall cease to be such members one year after such retirement, but may continue their membership as Associate members if they so elect, and should they return to public service, automatically resume their former classification upon proper notification.

Article 3, to be amended by adding a new section as follows:

Section 3. Senior members only shall be eligible for election to office in the Association, but Junior or Associate members may serve on committees.

By law amendments to read as follows:

No. 1. MEETINGS. The annual meetings shall be held at such time between August 1 and October 1 of each year as may be decided upon by the executive committee. The place of meeting shall be determined by vote of the annual meeting, following recommendation by the executive committee.

No. 4. Election of Officers. Officers shall be elected at each annual session as follows: A nominating committee of three shall be appointed by the president at the opening session, which committee shall later in the session submit a list of names of at least two persons for each office, which list and the names of such

other persons as may be placed in nomination by the convention, shall be voted upon. The vote shall be by ballot, and the persons receiving a majority of the vote cast shall be declared elected.

No. 7. Dues and Fees. (A) Applicants for membership in the Association shall pay a fee, with application, of ten dollars (\*10), which fee shall also cover the first year's dues.

Annual dues for Senior, Junior and Associate members shall

be \$5, payable in advance.

Dues for Sustaining members shall be ten dollars (\$10) per year.

(C) The fiscal year of the Association shall be from August 1 to August 1.

No. 11. EXPULSION, ETC. Any member of this Association may be suspended or expelled for unprofessional conduct or conduct unbecoming a member of this Association by a two-thirds vote at any annual meeting, provided charges in writing against such member have been filed with the secretary at least 30 days prior to the annual meeting, the accused notified of such charges and an opportunity afforded the accused to appear or present a defense at the time of hearing the charges. This shall also apply to members who may violate any of the provisions of the constitution or bylaws.

# The Complicated Park Situation in Chicago

By J. H. Prost,\* Illinois

Consolidation of the fourteen separate park districts existing within the corporate limits of the city of Chicago has been a paramount issue for a number of years. A bill for this purpose has been passed by the state legislature three different times. The first time the measure was included in the new city charter, which was defeated by a referendum vote of the people.

The second time the bill was passed by the state legislature as an independent bill, but was vetoed by the governor.

And now, the bill has again been passed by the state legislature, has been signed by the governor, and will come before the people in April, 1916, for their approval. It is generally conceded that the people of Chicago will unite and cast a majority vote in favor of this measure. It will be necessary, however, that a majority vote be cast in favor of the bill in each separate park district to make the measure a complete success. But the bill is so drafted that those districts voting in favor of the bill will be consolidated, while those rejecting the measure by casting a majority vote against the bill will continue with their present system of government.

The people of Chicago are justly proud of their splendid parks, boulevards, playgrounds, bathing beaches and city forestry work, the growth of which has kept pace with the rapid development of the city.

The existence of this multiplicity of park governments is due largely to the antiquated city charter and equally as much to the rapid growth of the city.

The Chicago Bureau of Public Efficiency prepared a report in 1911 which gives an excellent account of what can be accomplished by this consolidation of our park governments.

The accompanying plan will show the locations of these various park districts, their relation to one another and the city.

According to this bill the governing power will be vested in nine commissioners to be appointed by His Honor, the Mayor, and approved by the city council. Three of these commissioners to be appointed from the north side, three from the west side, and three from the south side.

This consolidation will bring about a more equitable distribution of the park revenues and benefits to be derived therefrom.

The South Park district is governed by a commission of five members appointed by the Circuit judges to serve five years. This system is the largest of the family having supervision over Jackson, Washington, Marquette and Grand park; about thirty-three miles of boulevards and twenty park playgrounds such as Sherman, Ogden, McKinley, etc. The total park area of the South Park district is 2,039 acres. The district covers about eighty square miles of Chicago's area. The South Park commissioners have published several excellent reports. Their 1906 report contains very instructive plans of their elaborate park playgrounds.

The administration of the South Park system has been excellent, and has set the pace for the other park administrations.

My studies and observations of park maintenance and improvements has led to the most convincing conclusion that the administration of the South Park system has been thorough in every respect. The plantations, lawns, gardens and lagoons are always in excellent condition, as are the walks, drives, buildings, bridges, fences, etc. To accomplish this and maintain such a high standard of efficiency requires a liberal expenditure of money, but the people are enjoying the benefits of this liberal investment.

If the healthful recreation, social pleasure, aesthetic inspiration, civic beauty, education and physical relaxation could be measured in dollars and cents, the south park investments and expenditures would show an earning of dividends that would fully justify these expenditures. The South Park administration believes in giving a tree twenty cubic yards of fertile soil in which to grow. That is why the trees and shrubs growing in the south parks are beautiful and almost perfect.

This illustrates the thoroughness seen in every activity carried on throughout the entire system.

It is true the South Park commissioners have the largest income for park purposes, but they also provide the most extensive park service and maintain the largest park area and the greatest number of recreation features.

The West Park district is governed by seven commis-

<sup>\*</sup>Superintendent of Parks and Public Forester, Special Park Commission,

sioners appointed by the governor. They have supervision over Garfield, Humboldt, Douglas and seven small parks, about thirty miles of boulevards and seven playgrounds, covering an area of 808 acres. The district covers about 34 square miles of territory. The West Park district lacks the power to obtain sufficient funds to take care of the needs of the territory under its jurisdiction.

Recently an additional bond issue of \$1,000,000 was issued for the development of new park areas.

The Lincoln park district is governed by seven commissioners appointed by the governor. They have supervision of Lincoln park, twelve miles of boulevard, five playgrounds and one bathing beach, covering a total of about 340 acres. The district covers fourteen square miles of territory. The Lincoln Park Commission has been doing extensive work in reclaiming and filling in submerged lake land, thereby adding about 250 acres of park land.

The Lincoln Park Commission has another \$1 000,000 bond issue before the people, which will be used in carrying on their extension work.

The Special Park Commission consists of fifteen members, five aldermen appointed by the city council, and ten citizens appointed by the mayor.

Its jurisdiction extends over the entire city, having small parks or playgrounds in nearly every park district—thus overlaping all the other park systems.

The commission has supervision over eighty-seven small parks, twenty-four playgrounds, three bathing beaches, a municipal nursery, and the City Forestry Work. The total area of these small parks and playgrounds is about 450 acres. A large majority of these playgrounds are located on school property immediately adjacent to school buildings. The commission has taken steps to establish about fifty new playgrounds upon school property, for which purpose a \$300,000 bond issue was passed by the people. This commission is now build-

ing a two hundred thousand dollar (\$200,000) building at the new Clarendon bathing beach, and is negotiating for the purchase of an extensive bathing beach between Seventy-fifth and Seventy-ninth streets along the lake shore.

The ten additional park districts are all small. They have come into existence to satisfy the park needs of the communities not already within any of the larger park districts.

In 1895 the state legislature passed an act under which these park districts might be established. By this act any one hundred voters resident within a proposed park district can petition the county judges to order an election for the purpose of deciding whether the district described in the petition shall be organized into a park district.

Each of these districts is governed by five commissioners elected by the people.

The Old Portage park district covers three and one-half miles of territory and has one 40-acre park under its supervision. This park is only partially developed and new bond issues must be voted to complete the work.

The Northwest Park district covers about ten square miles of territory. It has three parks under its supervision, Mozart of 4½ acres, Kosciuszko park of 9¼ acres, and Kelvyn park of ten acres. Mozart is improved with a field house, Kosciuszko is being improved with a field house, while Kelvyn park has not been developed as yet. The Northwest Park district has issued three hundred and fifty thousand dollars (\$350,000) in bonds.

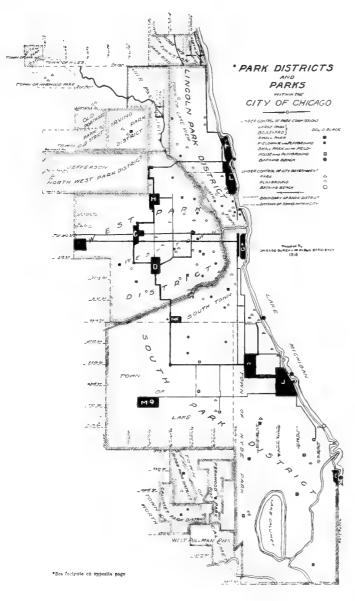

The Irvino park district covers about four square miles of territory, has a ten-acre park known as Irving park, which is well laid out with an excellent field house.

The Ridge Park district covers about ten square miles of territory, and has one improved park of ten acres with field house and outdoor swimming tank.

The River park district covers about six square miles

NEW BATHING PAVILION AT CLARENDON BATHING BEACH, CHICAGO, HT, IN COURSE OF CONSTRUCTION UNITS SUPERVISION OF SPECIAL PARK COMMISSION

of territory, and has about four acres of park land lying along the west bank of the north branch of the Chicago river.

The Fernwood park district covers about three square miles of territory, and has one improved park of about six acres.

The Ridge avenue park district covers about three square miles of territory. This commission spends annually about \$3,000. It has supervision of one and one-half miles of boulevard, and a one-half acre park. A \$35,000 bond issue has been passed and sold for the purpose of acquiring a larger park within the district.

The North Shore park district covers one and one-half square miles of territory. It has supervision of three miles of boulevard.

The West Pullman park district covers about one square mile of territory and has one 17-acre park now being improved. The commission has issued \$30,000 in bonds. They are now building a field house that will cost approximately \$26,000, which will give this community excellent service, and in this respect compares favorably with the \$300,000 field houses built by the South Park Commissioners. This field house contains a large combination gymnasium and assembly hall. Underneath this hall is an all year around swimming tank. Swimming tanks that can be used 365 days in the year

are now in greater demand than the out-door tanks used only during the summer months.

The Calumet park district has recently become a member of this family. It has about three square miles of territory and 15 acres of park land. The baby member of this family is the Ravenswood Manor park district. It covers about one-half square mile of territory and has no park acreage.

There remains about thirteen square miles of territory within the city limits not already organized into a park district. The people living in these districts of course enjoy the privileges provided by the park districts, for which they pay no tax.

The arguments in favor of consolidation are numerous and self-evident. In any event consolidation will ultimately be accomplished.

This gives a somewhat hasty account of our complicated park situation, which has been talked about a great deal but unfortunately is not thoroughly understood.

### CAVITY TREATMENT OF TREES.

(Continued from page 359.)

healing. The sections of cement should be as nearly square as possible, at least the length should not be more than twice the width. Each section should be finished with a flat surface, covered with roofing paper, and allowed to set before the one above is built; larger cavities sometimes requiring several days for completion. After the entire cavity is filled the paper should be cut even with the cement. The cement is then either left uncovered, or may be treated with a water-proofing material.

If the edge of the cavity is left in proper shape healing will begin very soon in strong growing trees, but much weakened trees do not heal as quickly. In some cases where the trees are very weak no healing takes place and the cavity should be cleaned out and refilled or in after years decay may set in around the edges and eventually destroy the tree as if it had not been filled. In fact all cavities should be watched to see that rot fungino not gain a new foot-hold and continue the destruction of the tree

Although cavity filling is important and is much more efficient than formerly, yet it is still very crude and much less satisfactory than prevention of decay in the beginning. Trees should be made disease-resisting by keeping them well fed, well watered and free from insects and fungi. The latter can be done very easily by spraying at the proper time with some good insecticide or fungicide. Do not allow trees to become weakened by neglect, and when found in this condition they should be built up by giviing plenty of fertilizer and abundant moisture.

"True worth is in being, not seeming, In doing each day that goes by Some little good, not in dreaming Of great things to do by and by. For whatever men say in blindness, Or in spite of their fancies of youth, There is nothing so kingly as kindness, And nothing so royal as truth.

We get back our mete as we measure:
We cannot do wrong and feel right,
Nor can we give pain and feel pleasure,
For justice avenges each slight.
The air for the wing of the sparrow,
The bush for the robin and wren,
But always the path that is narrow and straight
For the Children of Men."
—Selected.

# Concrete for the Country Home

(Continued from the July Number)

September and October are the months to prepare the hotbed. To avoid annual repairs, and to secure the best results build it of concrete. Locate the bed on the sunny, wind-protected side of a building. A four-sash bed is usually large enough except for commercial purposes. A standard hot-bed sash is 3 feet by 6 feet. Lay out the bed 6 feet 8 inches wide by 12 feet 10 inches long. The concrete walls are 6 inches thick. Dig the foundation trenches 2 feet 6 inches deep within the lines given above. Make forms of 1-inch lumber to carry the south (front) wall 6 inches and the north (back) wall 14 inches above ground. Forms are not required below ground level. The tops of the end walls slope to the others. Before filling the forms with concrete, test the dimensions of the bed by means of the sash. See that the sash lap the forms 2 inches on all sides.

ADMIRABLE LOCATION FOR COLD-FRAMES

Mix the concrete mushy wet in the proportion of 1 bag of Portland cement to  $2\cdot 2$  cubic feet of sand to 5 cubic feet of crushed rock, or 1 bag of cement to 5 cubic feet of bank-run gravel. Fill the forms without stopping for anything. Tie the walls together at the corners by laying in them old iron rods bent to right angles. While placing the concrete set 1/2-inch bolts about 2 feet apart to hold the wooden top-framing of the bed to the concrete; or make grooves in the top of the concrete for counter-sinking the sash to the level of the walls with an allowance of one-quarter inch for clearance. This can be done by temporarily imbedding in the concrete wooden strips of the necessary dimensions. During this operation, by means of blocks nailed to the strips, make provision for the center-bars described below. Remove the strips as soon as the concrete stiffens. Take down the forms after five days. The extra 25% inches in length of the bed is allowance for the three center-bars between the sash. These sash-supports are of dressed 1-inch stuff, shaped like a capital "T" turned upside down. The length of the stem of the "T" is equal to the thickness of the sash and the top is 3 inches wide. Sufficient materials for the concrete will be supplied by 14 bags of Portland cement, 11/4 cubic vards of sand and 21/2 cubic yards of crushed rock.

If the bed is to be used as a cold-frame, it is finished when covered with glass. For a hot-bed, dig out the dirt to the depth of 2 feet, tramp in 18 inches of fresh horse manure well mixed with leaves or bedding and cover it with 4 to 8 inches of rich soil. Bank the excavated earth around the outside of the bed. Put the sash in place, hang a thermometer on the inside and

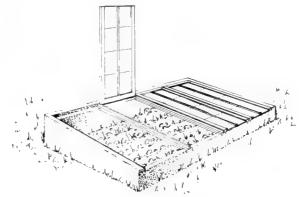

allow the bed to heat up. After a couple of days, when the temperature has dropped to 85 or 90 degrees, planting may be safely done.

During the midday, in bright weather, the bed will become too hot and must be ventilated for a short period by raising the sash on the side away from the wind. Water the plants in the morning only and ventilate later to remove the moisture from the foliage. On winter nights it will often be necessary to cover the bed with matting and boards.

It is a genuine pleasure to grow winter vegetables and flowers for home use.

### PREPARING THE HOTBED SOIL.

The preparation of the soil is one of the most important operations in hotbed work. And it is the main factor on which success depends, especially in the case with certain crops. A good hotbed soil is one that has a liberal supply of plant food in it, and at the same time is mellow and friable, so that the water permeates it uniformly and leaves it dry and loose on top. A soil with a large per cent. of silt and clay in it, if watered with a garden hose, tends to run together or bake and pack in such a way that the plants make rather a spindling growth if they grow at all. Such a soil necessitates frequent watering, and it is

THE HOTBED READY FOR ITS PREPARED SOIL

usually only the surface that becomes wet. On the other hand, any soil that has an over-abundance of humus in it will be so open and porous that the water will drain right through it and the soil will not retain sufficient water to supply the needs of the growing plants.

The best kind of a soil for hotbeds is one that has a foundation of good loam, and that is made loose by the use of rotted sods, rotted manure and sand.  $\Lambda$ clay soil must be opened up by the use of sand and fiber, while a distinctly sandy soil must be made more retentive of moisture by the application of liberal supplies of manure. The soil which the writer has used has given excellent results. Sods are skimmed from old pasture lands, where cattle have lain at nights for years; these are piled up in layers with stable manure and tobacco stalks. The tobacco stalks are high in potash and when piled in alternate layers with the manure and sods, the pile becomes a mass of decayed vegetable matter, and at the end of 12 to 15 months we have one of the best soils for starting seedling plants that can be found. Another method of preparing the soil for hotbeds is as follows: The sods are skimmed from old fields rich in vegetable

matter and placed in piles several feet deep, where they are permitted to lay for a year or two, and in the mean time they are forked over several times, hastening disintegration and decay. Sods treated in this manner will make excellent soil for starting plants anywhere. These rotted sods can be mixed with wellrotted manure if they are lacking in plant food.

Two parts of ordinary garden loam mixed with two parts of rotted horse manure and one part of sand makes a good hotbed soil. In all cases in preparing soil for hotbeds avoid the use of fresh manure, as it produces variable results and it gives a succulent growth to the young plants. The various ingredients should be thoroughly mixed and sufficient moisture added to the soil so that when it is crushed in the hand the ball of earth will retain its shape and crum-

ble when slightly rolled around.

The hotbeds should run east and west, with the slant toward the south. The pit should be excavated to a depth of from 20 to 30 inches, according to the severity of the weather where made. The excavation should be boarded up close and tight so as to keep out moles and mice, which are very troublesome when once they get started in the hotbeds. The pit should be filled to within one foot of the glass with fermenting manure, and then five or six inches of the prepared soil in which the seed are planted. The manure should be well tramped in before the soil is placed on it, this preventing any settling of the soil after the seeds are planted. Where flats are used in which the soil for the seeds have been placed, one or two inches of soil is all that is required over the manure, and the flats are set directly on this soil.

After the soil has been placed in the flats the sash should be placed over the frames, and thus remain until the soil in the flats has warmed up, by which time the weed seed will have germinated and burst forth. The soil should now be stirred about one inch deep and seed of vegetables and flowers planted.—

Legetable Grower.

### THE GASPLANT (DICTAMNUS ALBUS.)

Every pretentious country estate should possess a well-established gasplant, not the modern one, strung like a bead on a corporation line of public utilities, but the old-fashioned one that delighted our grand-mothers in the days of long ago, one that thrives without a meter and gives out its gas free of cost.

Such is Dictamnus albus (D. Fraxinella), bearing the common names of Dittany, Burning-bush, and Gasplant. The more recent introduction, the variety caucasicus, also known as D. grandiflora, is a stronger

grower, producing larger flower spikes.

Both are exotic species and to my mind should not be included in the wild planting, as their form and general appearance are not in keeping with the usual aspects of our native plants. If so used one would imagine at once that they were intruders "escaped from cultivation," as the botanists would say.

Their place in the border, informal planting and for dwarf hedges. In either situation the Gasplant is a most admirable herb, perfectly hardy, long-lived, possessing a foliage of a rich, glossy green that remains bright and fresh up to frost, and requiring no insect

powder to keep it tidy.

The books say—and they do not always tell the truth, but I hope this article does—that it thrives as well in the shade as in the sun. My experience does not coincide with this statement. I have a hedge of it some 50 feet long, which is partly shaded by a large

spreading Hawthorn whose branches reach over it but are fully 6 to 7 feet above the ground. There is plenty of diffused light over the plants, but no direct sunlight until late in the afternoon. The plants where shaded are fully 8 to 10 inches lower in height, and the flower spikes shorter and the foliage is not as luxuriant, as of those in full sun. I have seen the same result in other places.

The Gasplant makes an effective herbaceous hedge in open sunny situations. When in bloom—June and July—on well-established plants, the flower spikes, which are held well above the foliage, will reach a height of 3 feet. The spikes on D. caucasicus are some 6 inches wide at the base, tapering to a point a foot or more above. The white form is fine. When in bloom the plant possesses the stateliness and dig-

nity of the Lupines and the Foxgloves.

When the flowers fade the bloom, stalks should be cut well back, back a few inches below the main height of foliage, and just above a leaf stalk, thus leaving no stub to die back and turn brown. You will then have a campace if well-grown, glossy green hedge about 2 feet tall and almost as even in contour as if sheared. A little sheep manure worked into the soil every other spring is a great help to the plants.

So far I have been doing all the "gassing." Let us give the plant a chance to show why it received its

name

Again I must find fault with the books. All that I have read when speaking of this plant, state, "it is said that if a lighted match be applied to the flowers. a gas will ignite." I tried it for over twenty years and almost impoverished myself on wasted matches, and with no results. I came to the conclusion that the story

was a myth.

Late one afternoon Mr. E. O. Orpet strolled in to "Egandale" and, approaching my hedge, remarked: "This ought to be a good time to try the Gasplant," and placing a lighted match to the base of the flower stalk, I was astonished to see a flame rush to the top with a perfectly audible hiss. The myth became a reality. The secret was out, and I wondered why some one, who must have known it long ago, had not published the facts, since I, for one, have lost many opportunities of amusing the children—and we are all children in some things—by showing them a flower that produces a flame that does not injure itself.

How came this curious phenomenon to be discovered? It appears that an extremely volatile gas emanates from the main stem of the flower stalk, from the base of the blooms up to the top. It ignites only on warm, calm evenings, and seems to hug the main stem; consequently the lighted match must be held close to the stem and immediately under the lower tier of flowers. I had held the match to the outer rim of flowers, some 3 inches away from the gas, hence my failure. It is a singular fact that if the flower-stalk is cut and removed it will not ignite. Either species is slow in establishing itself, but once it gets a good start it will outlive the planter if given a fair show.

—W. C. Egan in Billerica.

When James A. Garfield was president of Oberlin College a man brought for entrance as a student his son, for whom he wished a shorter course than the regular one.

"The boy never can take all that in," said the father. "He wants to get through quicker. Can you arrange it for him?"

"Oh, yes," said Mr. Garfield. "He can take a shorter course: it all depends on what you want to make him. When God wants to make an oak, He takes a hundred years, but He only takes

two months to make a squash."—Exchange.

### WATERING PLANTS IN POTS.

Numerous are the inquiries as to the time and frequency of supplying greenhouse and other indoor plants with water. The curious part is that people seem to take it for granted that it should be done at stated hours and intervals. Those who water their plants at regular intervals and give each about the same quantity of water are pretty sure to kill some of the most valuable and delicate, as in a conservatory or other house full of plants there is scarcely one but will differ from its neighbor in the amount of water it requires, even if the plants are all of the same species. In a mixed collection the difference in the amount of moisture to be supplied is very considerable. Succulent plants-Aloes, Yuccas, Cacti, Mesembryantheniums, and such fleshy-leaved subjectsrequire little or no water from the beginning of November to the end of February; at least, such is the rule among good cultivators, though it is not wise to apply it rigidly to some of these plants, which are apt to shrivel and get hurt if allowed to become dust-dry. goniums, again, though they must not get quite dry, require to be kept comparativeley so in winter till their flower buds are formed. Plants in a vigorous growing state, or coming into flower, as some are at all seasons, will, of course, require to be will supplied with water; that is, they require to be as moist at the root as we keep growing plants in summer, only that one-third the amount of water and watering which would be required in summer will suffice to keep them moist at this season. It is impossible to lay down a rule which would be of the slightest use as to the time of watering, etc.

A healthy-growing plant in a pot, which is, as it ought to be, thoroughly well drained, cannot well have too much water when it is watered. Do not water a plant till it requires it, and then give a thorough soaking.

In hot summer weather plants should be examined every morning, and in most cases watered; and in the case of free-growing Fuchsias and other soft-growing plants in the height of their bloom it may sometimes be necessary to water well twice a day. After a little practice one can readily detect those that are dry by merely looking at the soil, but in cases where the specimens have been top-dressed, etc., and soil without roots in it lying on the top of that full of roots, and where bad watering has been practised, so that the earth is wet on the top and dry at the bottom, it may be necessary to strike the pot with the knuckles to see if it sounds hollow. This indicates want of water. When a crack is seen between the soil and pot it is an almost invariable sign that the plant wants watering. In such a case the soil should be first firmly pressed to the sides of the pot and a good soaking given. When the operator meets with a dry plant, instead of pouring a little water on the surface, as many do, he should fill the pot quite full, and if there is not a good space for water between the soil and top of the rim he should return to it and fill up again, so as to ensure a thorough soaking, for a plant wet on the surface and dry as dust down where its main roots exist is in the worst possible condition. In fact, it is not a bad plan to make it a rule to water gross-feeding and large specimens twice when they get dry.

Great harm used to be done by pouring on a little sip every morning, which resulted in the pots becoming covered with green slime and the soil often a mass of black mud. When rapid growth begins in the first bright days of March, the plants must be looked over every morning, and from that time to the end of October. Some people fill the pots with too much soil and do not leave sufficient space for a proper dose of water to be poured on; this

is a bad plan, and has caused the death of hundreds of valuable plants. As a rule, the pot should not be filled higher than within half an inch of the brim, and in the case of large pots an inch. When settled down there will then be sufficient room for water, and sufficient opportunity to give a good drink at once—not watering again till the plant really wants it. One good watering in midwinter will often satisfy a healthy specimen plant in full leaf for two or three weeks; ten weeks later it may require watering every day.—Gardening—(English.)

### PRODUCING NATURAL EFFECTS IN CON-SERVATORY PLANTING.

(Continued from page 367.)

We have attempted a little departure from the conventional method of planting green houses or conservatories, and we have throughout been confronted with the problem of giving the plants the conditions that they most needed and have then tried to add those touches that make plants better friends. And it seems that in the planting of any house that is worthy of the name conservatory the use of benches and stages and the growth of plants in tubs and boxes is almost inexcusable. Greenhouses or conservatories should be little bits of nature under glass, and the glass and everything necessary to hold it up should be the most inconspicuous part of the whole house. Such parts of the house as do necessarily come into vision should be in the nature of garden ornaments and should admit of proper framing with plants. In conclusion, let me add that the greenhouse which includes doors, glass, heating system, walks, benches (if any) should be constructed with very definite consideration of the plants that are to be grown in them, and they should be so constructed that they enter, from the inside at least very little into the perspective. An ideal conservatory, to my mind, is one that cannot be seen from the inside; and this is the ideal that the greenhouse man is striving toward.

# A COMBINATION OF HONEYSUCKLE AND CLEMATIS.

One could not wish for a combination of two vines better fitted for ordinary arbors than the Japanese Honeysuckle and Clematis paniculata. They both are free growers, but with care in pruning in Spring one can be kept from infringing on the other in the way of space. It is true both are light colored, the Honeysuckle creamy white, changing to yellow; the Clematis, white. But then their seasons are different, the Honeysuckle flowering in June, the Clematis in August. It is the different seasons of flowering that add to the utility of the combination; then the change of foliage and general difference of one from the other add to the charm of the whole.

There remains to be mentioned, too, the beautiful display the seeds of the Clematis make. They are usually numerous, and when they are ripening, and later, their appearance is charming, changing from green to a light brown, with the usual feathery appendage of Clematis seeds, which gives them a feathery appearance.

It happens that both have shining green foliage, keeping this color until late in Autumn. The sweet odor of both these vines is well known, betraying their presence when in bloom often before the plants are visible. When we add, both are among the hardiest of vines, are they not a splendid pair to plant together?—Joseph Mechan in Florists' Exchange.

# The Question of the Gardener

By a Gardener

Editor's Note. In the September number we will publish a letter, which first appeared in the London *Times*, on The Behavior to Gardeners, by an anonymous contributor, and later reprinted in book form.

### BY A GARDENER.

The question of the gardener was a lmirably dealt with in the notes from Mrs. Francis King's book, in the July Chronicle. Doubtless the editor will see to it that the question is kept alive for discussion. The prize offered by Mr. Everitt, president of the National Association of Gardeners, would be deservedly won if any essavist, in the competition that the association has arranged, pointed a way whereby trained professional gardeners could obtain that recognition and remuneration to which they believe themselves justly entitled. They would like to be accepted as of the same standing, professionally, as men engaged in other sciences. It would be an easy matter to prove, I believe, that our first rank gardeners are men that measure up in general knowledge to any of the men in these other professions, while their experience and rigid training are equally as exacting and severe. The difference between high-class trained gardeners and other professional men is that the latter are profit-makers, while the gardener is thought not to be. Can this latter idea be combatted—successfully combatted? (This I leave open for the present, at least). A second question in regard to the gardener is whether, through organization, he can protect himself, elevate his rank, assert his position and assure the true recognition of what he deems his influence to be in the life of the community or nation. The answer without having given the question all the thought it deserves-appears to be that craft guilds, when properly conducted, have been beneficial along those lines. The third matter concerns our system of training—or rather, want of it. This matter will certainly have to be thrashed out. If all the "big" successful gardeners are not themselves the sons of gardeners, at least they have been men with such an intense love of gardening and things of the outdoor world as to bring them in a class of geniuses—not supermen, like Dante, Shakespear, Newton, Napoleon, Mendelssohn-yet gifted men all the same, whom we call "born gardeners." are naturally apt and easily trained, and they rise to the top. Yet over and above natural inclination, bent, skill, genius—call it what you like, there is the necessity for a regular drilling, discipline, schooling. Do our gardeners get it? Are they trained in the necessary science, literature, art, and business pertaining to gardening. Are they educated in what the fashionable world lays great stress upon—correct speech and manners? Gentlemen, the question enlarges too much to be discussed in any other than a more cursory, perfunctory, superficial manner in any one issue of the GARDNER'S CHRONICLE. The professional horticultural societies might do well to lay aside all else and thrash out this subject in a series of meetings. And then what? Yes, what?

### BY AN EMPLOYER.

The extracts from the book, "The Well-Considered Garden," by that very estimable lady, Mrs. Francis King, and your editorial on the same, published in your July number, was read with keen interest by myself and, no doubt, by many other "estate" owners of my calibre. While agreeing that, if studied with a reasonable degree of intelligence, "The Ouestion of the Gardener" is not

antagonistic to either the cause of the employer or the employee, and fairly presents the situation as it exists today in this country, is, however, such a propaganda. as you suggest should arise from the agitation of the subject, not likely to be counterbalanced in the good it may accomplish by the dissatisfaction it may create through misinterpretation among men, who are at present perfectly content and satisfied with their surroundings and possessions? I need only cite my own case, in all probability not an isolated one. I employ what you class a working garderer, and I think he is correctly termed, although he subscribes himself superintendent of my estate, which is a little country place of fifteen acres. modern dwelling, garage, barns, poultry runs, and the gardener's cottage complete the buildings. Two cows and two horses constitute the cattle. One of the horses is used for working the farm, which consists of a few acres under cultivation to provide fodder for the cattle, and the other is at the gardener's disposal to do his chores at the village during the week, and to take his family to meeting or on a pleasure jaunt on Sundays. The balance of the place comprises the vegetable and flower gardens and a few fruit trees. And I must not forget our glass range, which consists of quite a complete block of cold frames. During the busy or growing season, my gardener has all the necessary help he requires, usually Italian labor, as it is difficult to secure any other in our community. Certain months of the year he manages the estate alone, calling in occasional help when needed. I never directed him in this, as he is a faithful and conscientious worker, and I have given him free hand to supervise the place since he has been with me.

The family is on the place for about eight months of the year, during which period he supplies the house with vegetables, milk, poultry and flowers, and the rest of the year he has simply to provide for himself and family.

My superintendent's salary falls well below the \$150 mark, which you specify should be the minimum wage for an estate manager. I pay my gardener seventy-five dollars a month and include a cozy cottage, heat, light, vegetables, milk and poultry, so that practically his salary includes his household maintenance, for my gardener's family is so fond of chicken that his meat bills must be nominal.

My gardener has never complained of being dissatisfied with the remuneration he receives for his services, and I am quite convinced that there are few skilled mechanics in our state who are better off at the end of the year than he is. And how many attorneys, physicians and clergymen are there in the small cities and towns who can lay claim to seventy-five dollars a month above their expenses?

Now, I am quite certain, that if I would deprive my gardener of his self-applied title superintendent and would designate him as a working gardener, he would soon become discontented with his position, even if everything else connected with it were agreeable to him. On the other hand, should he become interested in your propaganda, for I regularly pass the Chronicle over to him after I have read it, he may become imbued with the idea that he is a very much underpaid employee, which be does not now seem to think, nor do I believe he is. It really seems to me that The Question of the Gardener and his compensation is a subject that can never be universally adjusted, but is one that is controlled entirely by individual conditions and surroundings.

Niay I suggest that a proper classification of the different titles of gardeners, properly enforced, may be helpful to their profession and that it should be undertaken by them in their campaign of education.

"There is no room for envy in the heart of a man whose life is consecrated to interests larger than his own. He who is trying to serve not himself, but the world, will not be jealous of those whose efforts in the same direction are crowned by higher achievement. If, when I have done my best, the quality or quantity of my work remains below the average, that is cause for regret; but if there is some one whose performance rises far above the common level, I ought to be glad that the abundance of his success balances the deficiency of mine. I shall be glad if I love the cause for which I labor more than my own profit or renown."

### QUERIES and ANSWERS

If a bonce of expentest give an time implished for the solutes, and is, by instituting a query of a constant experience of a constant experience. It is an arranged or the solutes of the process of the defore  $\chi$  of the left to be the  $\chi$  of  $\chi$  of the helping each then,  $\chi$  is  $\chi$ , and against this  $\chi$  of standard  $\chi$ .

Will named varieties of Sweet Williams planted near together, i. e., in bed form, mix, or will they come reasonably true from seed saved from the plants?

Will Asters planted in bed or hedge form mix or come true

from seed saved from plants so situated?

New York. C. F. B.

In answer to above query regarding different varieties of Sweet Williams and Asters being planted near each for seed saying, unless the flowers are protected with mosquito netting or other suitable covering from bees and insects the poll-n would undoubtedly be transferred and in that way the colors would become mixed.

New Jorsey.

I have a flower horder which is planted at present time with honeysuckles and paconias. In this border also are three Norway Maples whose roots take quite a lot of nourishment from the plants underneath them, hence they do not flower very freely.

My employer is anxious to have me plant this border with something that will give us better results in flowering, if pos-

sible, and still retain the Maple trees.

Can any reader of the "Gardeners' Chronicle" advice me what I could do under the circumstances? This border can be well supplied with water in dry weather. In summer, of course, it is very shady owing to the overhanging Maple trees.

Co:n.

In answer to above query about border with maple trees: it is almost impossible to get satisfactory results from flowers planted under maples, and I would recommend planting vinca miner thickly over the whole ground. This flowers beautifully in spring and carpets the ground with rich shining green foliage at all times.

Massachusetts.

EDWIN JENKINS.

Can you explain the cause of grapes under glass shanking or shriveling up? I have been advised that poor drainage or too rend watering is often responsible and it has been suggested that they be given a rest from watering. Our dramage is not faulty but I did give less frequent waterings this season than last, but the trouble has again appeared.

Penna.

Shanking grapes have given considerable annoyance to grape growers, and many a promising crop has been practically de-stroyed through shanking. This usually occurs during the color-ing process. Stanking can be brought on through different causes: too much water at the roots or the reverse would be favorable towards bringing on the trouble. Exhausted borders or poor drainage also would be a cause or a severe check in any shape or form would be an incentive toward shanking. However, should the trouble be with the borders, such as imperfect drainage, or

poor border, the only tensors would be to make a fresh stut. that is, renew the folder and plant young vines. I maintain there is more shanking brought on through poor dramage than any other cause.

New Jersey.

WM. TURNER.

Kindly inform me what is the cause of my geranium plants being affected like the specimen leaves I am sending you, and what remedy is there to rid them of this disease.

The leaf starts to curl slightly then immediately it is attacked by brown spots, turning to black; then the leaf turns yellow and drops off the plant. The plants that are trouvled with this disease are useless as the flower buds turn black and do not bloom. New York, J. M. D.

The geranium leaves received are affected with what is commonly known as geranium spot, an affliction which was generally supposed to be a fungus disease known as stigmanose, but during the past year, since some of the agriculture leparements have become interested and have taken it up there seems to be some dispute as to whether it is the result of a fungus or the result

of injury by their or aphis.

The trouble in the summer almost invariably makes its appearance during a very warm and sultry spell of weather; the leaves will at first show light yellow spots on top which gradually develop until there is a general spotting of the leaves until they turn yellow and finally die and fall off, which spoils the looks of the beds as well as weakening the plant. It will sometimes almost denude a bed of leaves and not trouble in the least geraniums planted in vases near by where they are more exposed to the air and dry out more readily. The trouble usually disappears just as soon as the weather clears and gets cooler, that is the new growth will be free of spots. It is best to keep all yellow leaves picked off and the plants well fed with a good liquid manure, so as to promote a new healthy growth; light sprayings of Bordeaux mixture will help to keep the spot in check and yet the use of it will injure the looks of a bed by spotting the leaves.

In the greenhouse it will make its appearance in any place where the plants are kept over wet, or on any that are allowed to become badly pot bound, during the short days of winter, more especially in the early spring when only light firing is done and the dew is allowed to gather on the foliage during the night. Then again it will come on a bench that is pot bound and becomes very dry and, the idea being to hold them back, in watering only a sprinkling of the foliage is given, wetting it and not the soil at the roots. It would seem then that the foliage absorbs more of the moisture than it can contain, causing a swelling and bursting of the under tissue of the leaf which allows the fungus to enter and develop, thereby causing the spot and eventually de-

stroying the leaf

As a preventative in the houses do not keep them too warm at nights, as that will encourage a soft growth which is more susceptible to disease. Forty-five to 50 is warm enough, on bright days it can go higher, 75 to 80 will not hurt, if air can be given at the same time. Do not water at all unless the plants are dry enough to take a good watering, then put enough on to wet the roots as well as the tops; above all things avoid as far as possible the foliage, being damp at night, give plenty of air: always remember that the important necessary essentials to the growing of good geraniums is fresh air and sunshine.

While this is not intended to be a scientific discussion of the subject I trust it will help your subscriber to rid his geranium

of the trouble.

Maryland.

R. A. VINCENT

### Of Interest to Estate Owners

The National Association of Gardeners maintains a Service Bureau which is at the disposal of all who may require the services of efficient gardeners in their various capacities.

The association seeks the co-operation of estate owners in its efforts to secure opportunities for those engaged in the profession of gardening who are seeking to advance themselves. It makes no charge for services rendered. It endeavors to sup-ply men qualified to assume the responsibilities the position may call for.

### LENOX (MASS.) HORTICULTURAL SOCIETY.

There was a fine display of Sweet Peas at the Lenox Horticultural Society's meeting. held on Wednesday evening, July 14. George Foulsham, superintendent to W. B. O. Field, and Edwin Jenkins, superintendent to Giraud Foster, were both awarded a diploma for their display, comprising about thirty varie-Newport, R. I., August 18-19, 1915. Special ties each, and showing a high degree of show, Atlantic City, August 26-29. culture. E. J. Norman was awarded a firstclass certificate for a new rambler Rose named Annie Norman. The number of entries in the competition for school gardens has beaten all previous records and has gone over the hundred mark. For the society's Summer show, to be held July 27, 28, Messrs. Arthur Herrington, Madison, N. J.; Robert Scott, Pittsfield, and Fred, Heeremans. Lenox, have consented to act as judges. don McMillan, Harold Bryant and William Spraff were elected as committee of arrange-

LEWIS BARNET, Asst. Secy.

### NEW BEDFORD (MASS.) SHOWS.

The Peony and Rose shows of the New Bedford Horticultural Society proved to be very successful exhibitions, particularly gratifying to the committee in charge because of the increased interest in both the peony and rose as evidenced by the many new exhibitors among the amateurs. At the present rate of increase of exhibitors the society will soon have to find a larger hall, and as the peony, since the first exhibition three years ago, has taken a very strong hold on the flower loving public, it looks very much as though the show committee would have the difficult problem of new quarters on their hands.

One of the chief attractions at the peony show was a table of gloxinias from the Galen Stone place (Arthur Griffin, Supt.) and many were the compliments heard by the writer as to the quality of the flowers and the beautiful arrangement of the plants well supported as they were with cocos palms and maiden hair fern. Among the peonies H. E. Converse, (D. F. Roy, Supt.), was the leader, capturing for the second time the H. F. Michell silver medal for the best collection of peonies, while W. F.

Turner came in for the bronze medal for The Sweet Pea exhibition at the exposition collection of new varieties seen in the hall, were unable to be present, as they were bus andria Duff, Georgianna Shaylor, Therese, showed the finest collection of Japanese vamany choice blooms of the double sorts. Charles R. Price filled a whole table with German iris and well deserved the cup offered for the best collection of iris, any class, J. C. Forbes, F. G. Tripp, James McVicker and Pierre Nolet were among the other exhibitors having line blooms.

At the rose show Galen Stone again furnished one of the most attractive exhibits with his table of perennials splendidly grown and beautifully staged. Among the roses H. E. Converse held the lead in the open class and Miss Alice Stackpole of Mattapoisett, won the cup in the amateur class for the best display. Among the other features were the vases and baskets of Silver Moon and Dr. Van Fleet, staged by A. J. Fish, a vase of these two roses and Ruby Queen by W. F. Turner, a specimen bloom of Mabel Drew by the same exhibitor, and a display of Fran Karl Druschki and J. B. Clark by Pierre Nolet.

The judges were James Garthly and G. A. W. F. TURNER.

### MENLO PARK (CAL.) HORTICULTURAL SOCIETY

In the absence of the president, the meeting was opened by Vice-president Slade in the chair, with about 30 members present.

### The Greenhouse Builder's Test

WHAT a greenhouse builder has done in the past, what he is doing now, and what he is reputed to be capable of doing, these things constitute the only valid test of a builder's capabilities and claims.

Where an owner makes his selection of a builder on the above basis, the Metropolitan Material Co. organization can stand the test in a fashion which will make choosing easy.

Forty-four years at greenhouse construc tion has made us experts.

We flourish by comparison.

Put your greenhouse problems up to us. Let us submit plans and prices. We go Let us submit plans and prices. anywhere in the U. S. A.

Chestnut Hill. Phila, Box O. Pa.

A UGUST is the month when gardens and lawns begin to show signs of wear and tear. Summer is starting on the down hill. Are you going to just sit back and let it go at that this year; or will you stir about a bit and see if something can't be done to prolong their vigor and further continue your enjoyment?
most plants, shrubs and lawns

need right now is some tangible encouragement in the form of soil enrichments.

They want some fresh food.

They want some new backbone building material.

They want more friability to the soil, more air and moisture about their roots. Any dependable gardener will tell you this

For accomplishing every one of

these requirements Alphano is ideal. It is a plant stimulant, a root food, a permanent soil builder.

Spread it on your lawn and rake it in. Bolster up the thin spots. It costs so little you can use it freely.

Send for the Convincement Book, which both shows and tells you exactly what Alphano will do for you, as proven by what it has been doing for others in the last

Science is teaching that it is as essential to

# PROTECT PLANT LIFE

from insect pests and the various fungi with which it is afflicted as it is to properly fertilize it. The importance of this to successful cultivation is becoming more and more evident as more is learned about the growth and habits of vegetation.

a concentrated liquid spraying real relationarity soluble in mater is used at carious strengths, according to divicences in cans.

Aphine is equally effective in the house and garden; free from disagreeable odors of most insecticides, and practical for

professional and amateur growers.

It is effective against green, black and white fly, red spider, thrips, mealy bug, soft scale, rose cabbage and currant slugs, and other soft bodied and sap-sucking insects. It can be applied to the tenderest foliage, flowers, fruits and vegetables.

Aphine will keep your plants (sweet pea vines, rose bushes,

etc., etc.) in the garden free from insects.

Aphine is used by prominent growers as a wash for decorative stock.

Gill, 25c.; half pint, 40c.; pint, 65c.; quart, \$1.00; gallon, \$2.50.

# SCALINE

is an oil and sulphur composition—three in one, a scalicide, insecticide, and fungicide combined, composed of a high grade of petroleum, and the properties of the well known

fungicide, Fungine. It is a most efficient winter spraying material for San Jose and other scale.

Use one part Scaline to twenty parts years

As a summer spray for hardy trees, shrubs and plants it is an effective remedy against green, black and white fly, red spider, thrips, woolly aphis, cottony maple scale, tulip scale, mealy bug, and all soft scale.

Use one part Scaline to forty to fifty parts water.

The sulphur contained in Scaline makes it an excellent preventive against various fungi at all

seasons of the year.

Scaline will rid your evergreens and shrubs of the red spider pest, which has done so much

havoc to them recently.

It is summed spreading. So line is recognized as a coefficient with more continuous nor of literature emulsion; more effective and more economical. It mixes readily with water, contains no sediment, and can be applied with the finest spray nozzle.

Quart, 75c.; gallon, \$1.50; 10 gallons, \$10.00.

# FUNGINE

is a concentrated sulphur composition, used as a spraying material, readily soluble in water, containing no sediment, and, unlike Bordeaux mixture, and lime and sulphur, does

not stain the foliage, but cleanses it.

It is an intallible remedy for mildew, rust and wilt, affecting flowers, fruits and vegetables, and is used with much success by leading growers on young stock as a preventive against various blights; also against bench fungi.

One gallon makes 50 gallons spraying material.

Half pint, 30c.; pint, 50c.; quart, 75c.; gallon, \$2.00.

# VERMINE

is a soil sterilizer and vermicide. Destroys cut, wire, cel and grub worms, maggots, root lice and ants. Used one part to four hundred parts water, thoroughly soaking the

ground, it will protect your plants and lawns against ravages under the soil.

Gill, 25c.; half pint, 40c.; pints, 65c.; quart. \$1.00; gallon, \$3.00.

These products have the endorsement of leading commercial and private growers, and are generally recognized as standard remedies for the control of the insects and plant diseases for which they are recommended.

For sale by the leading seedsmen throughout the country. If not obtainable in your community, send us your order direct and we will have it shipped to you from our nearest agency.

# Advantages of Fall Planting of Evergreens

By H. E. Holden, New York.

Many views have been expressed on the one side in favor of Spring planting, and on the other in favor of Fall planting. It can be said that by far the largest portion of planting stock, both deciduous and evergreen, has been set out in the Spring, but this is doubtless more through custom than otherwise. It is natural that Spring should bring with it a general desire to plant, more so indeed than the Fall, when most people are looking forward to the advent of Winter and a return to their city homes. .The fact remains, however, that with the approach of Autumn, practically all plant forms have reached their mature growth for the year. With the full landscape before one, it is possible to form a clearer idea, and an easier solution of the existing needs for improvement, here and there, than in the Spring, when the landscape is still generally bare and Nature is about to return to another season's growth. One has a longer season of thought and preparation in the Fall than is possible in the Spring. Often, as in the past Spring, the season advances so quickly from Winter into Summer that not only the preparation for planting, our plans, etc., but the planting itself must be hurriedly done. In the Spring, stock is going from a dormant state into a growing one, and unseasonably warm weather often occurring in the height of the planting season is, not infrequently, the cause of very serious injury to new stock, both while in transit and when received, due to the general hurry to get it planted to save it. This is, of course, in a measure more true with deciduous stock than with the evergreen species, the planting season for the latter being a little longer. Nevertheless, in the general rush to plant up to the last possible minute, entirely too much coniferous stock, as well as many of the evergreen shrub species, is planted in late May or early June, after the new growth has in many cases reached from an inch to three or four inches in length. When this is so, every possible care, such as frequent spraying, shading, etc., must be given, in order to assist this new growth to harden up, otherwise this new growth will quickly wilt and die back, generally resulting in an unsightly specimen for a long time. or more often in heavy losses. Too often such plants are set out without any extra care, and in the expectation that the plants can take care of themselves.

Here, then, with Fall planting at hand, we have an easy solution of this difficulty. In a short Spring, when stock has well started before we have been able to complete our planting or our planting plans, why not put off further planting a few months, say, until August and September for evergreens, and October and November

for deciduous stock, in the meantime completing our plans. By August all of the evergreen species have finished their growth, and all new growth is sufficiently hardened. The ground is in its full warmth during these two months, and even in October. These are the three months, the two former preferably, when evergreen planting can be arranged with the absolute certainty that the results to be obtained will be at least at satisfactory as in Spring planting, and the chances are that many who may be somewhat averse to Fall planting will be agreeably surprised with the results of their labors at this season.

There is one, and only one possible adverse condition to be considered as against Fall planting of evergreens. It of course sometimes occurs that we suffer a severe Spring drought, but we are perhaps more subject to such drought during the very months when Fall planting of evergreens can be done to best advantage. Where a severe drought should occur over an extended period it would be pure folly for anyone to suggest the advisability of planting under such circumstances, unless one is provided with the necessary facilities to provide readily the necessary moisture, which natural conditions at the time may lack. Where moisture as a result of favorable weather conditions is ample during these months, it can be safely said that this period is ideal for planting evergreens. Plants set out during this period will take root quickly and become well established before the severe Winter weather begins. The general warmth of the ground, if provided with sufficient moisture, added to the fact that an evergreen is then in its most healthy and vigorous condition after completing its season's growth, creates then a condition perhaps more conducive to safety in the transplanting of evergreens than any other period of the year. It might be added that the writer has seen highly satisfactory plantings of evergreen types set out up to the end of November, and in several cases even in December, with comparatively few losses.

While it is to be regretted that a more general use of the many and excellent species of Coniferous Evergreens and Evergreen Shrubs has in many cases seemingly been openly discouraged, and in others receiving only passive encouragement, it can hardly be said that this apparent disinterestedness is through any lack of appreciation of the many merits and advantages of these species for general ornamentation.

The question has often been asked, however, by those directly and otherwise interested in such development: how the heavy and in many cases excessive losses often

suffered in evergreen planting can be avoided, or at least minimized?

In comparison with deciduous planting somewhat heavier losses are to be expected, but such losses need not be and should not be excessive, or indeed little heavier than is usual among the general types of deciduous trees and shrubs. In the selection of suitable evergreens, much importance should be placed in the types which can be successfully grown under such soil and climatic conditions as we find them. In this connection no specific rule can be followed, and general observation and more or less experimentation are necessary when these conditions are so diversified as are those which American planters must face. Insofar as the soil conditions are concerned it can be said briefly that as a general practice a fairly rich and well drained loam soil is necessary, except in the case of some few varieties capable of withstanding less advantageous conditions. The matter of types, and a means of correcting adverse local soil conditions will be taken up

Further in the matter of selection it should be seriously considered when arranging for a possible source of supply for the evergreens desired; under what conditions have they been grown and how? It is essential that the root body of an evergreen be properly prepared for the ordeal of final transplanting, more so indeed than the need of producing a properly balanced and well furnished specimen above ground when the chances of its success or failure to live after planting is concerned.

Frequently transplanting in the producing nursery, root pruning, and other scientific treatment are the means to this end practiced by reliable professional nurserymen. With this the ultimate planter is little concerned; the confidence and certainty that it has been properly cared and provided for is, however, his concern and a vital one. It is possible to produce by neglecting entirely the necessary care referred to, a specimen which in general appearance and structure above ground will quite equal one which has been produced under the highest cultural methods as to root production beneath. The former, however, from the viewpoint of ultimate results is practically worthless. Thus the importance of selecting evergreens from none but reliable sources.

Directly bearing and of greater interest to those contemplating a more extensive planting of the various evergreen forms and species is, of course, the necessary care in preparation and planting, and their after treatment and culture. Immediately after the stock is received, whether in cases or loose in bulk, the plants should be unpacked, except in heavy, dry, windy weather, when this should be deferred until a more opportune time. It should, however, be given the earliest attention. If a large lot, or if for other reasons they cannot be promptly planted, they should be placed together in a somewhat cool and shady situation and the roots protected with a covering of moist soil from where they can be taken as needed. A strong, dry wind to which the roots may be exposed for any length of time will cause irreparable injury and planting under such weather conditions should be avoided wherever possible.

In making the necessary excavation for planting one should be governed as to the depth and breadth of the excavation more or less by the size of the root ball of the individual specimen, and in this connection it is well to mention the importance of having all of the plants dug at the nurseries from where the plants are purchased with a good ball of earth, and this securely protected with a covering of burlap. The excavation for planting should be made at least three or four times larger than the root ball and about a foot deeper. In the event of the soil

being of a very poor quality, such as a heavy binding clay soil or a light sand or gravel soil, etc., it is advisable, in fact necessary, to excavate as above and dispense with it entirely, replacing it with a good loam, which is usually readily available. In cases where such soil cannot be readily provided a liberal mixture with the existing soil of a good well *rotted* manure, preferably cow manure, will serve this purpose, but hardly as well. It is well in such cases to so prepare the soil if for spring planting in the previous fall or for fall planting during the spring to enable the soil and manure to rot down well before planting. In soil having a heavy clay texture an addition of sand will help lighten it.

If the soil is already of sufficiently good quality the use of manure or artificial fertilizer is not necessary and is not to be recommended. In affording a liberal excavation the soil broken up as smooth and fine as possible thus returned and much in excess of what the plant would otherwise immediately require will make available practically a highly cultivated area for the plant's future growth, and giving a deep, mellow bed in which to extend their new roots. This simple and important operation is frequently ignored and in such cases result in very heavy losses. A small shallow excavation will result in starving

or drying out the plant in short order.

In placing or setting the plant the mistake is sometimes made of planting too deep or too shallow. The correct depth to plant can best be judged by the soil mark indicating where dug at the nursery or its planted level then. The top of the earth ball should be placed slightly below the ground level. After the plant is set in the proper and desired position, the soil is then filled in and well firmed or packed. The matter of firming the soil well is another very important feature. The soil to be returned before the plant is set to create the proper planting level should also be well firmed, although not necessarily packed. Where the soil may be somewhat dry, it is advisable before entirely filling in to pour in a liberal amount of water, and allow this to settle before filling in the rest of the soil. Some planters make use of this operation under all conditions, as it not only helps to pack the soil, but also renders necessary moisture which is retained for some time after planting. When the entire planting operation is completed, it is well to form a shallow basin of the soil around the tree where rains will accumulate, and be taken up slowly by the ground underneath. A covering or mulching of well rotted manure or other matter will aid in conserving the moisture, and prevent the soil from baking or crusting. Where very dry weather is encountered for any considerable period after planting a good spraying or syringing of water applied to all the tops and foliage each evening during the drought should be done until a good rain makes its appearance, or the plants show signs of coming into new growth. In spring planting the critical period seems to be up to about July 1, after which if the plants are showing new growth or are in good, healthy color they may be considered on a fair road to success

In conclusion it can be safely said that there are no unsurmountable difficulties in the way of evergreen planting. They should and will respond readily in nine cases out of ten to ordinary care and treatment, which in detail the writer has endeavored to explain simply and as far as possible without the use of technical terms. Common sense and a little necessary care will most assuredly bring its reward.

[In the October number the author will present an article on "The Advantages of Evergreen Plantings and Desirable Types."—Editor.]

(To be continued.)

# The Perennial Garden

The most beautifully wrought bedding plant scheme cannot compare with a well-designed perennial garden, with its daily surprises and new faces to welcome us. One week it is a riot of color and the next something different. It presents an ever-changing succession, commencing before the winter snows have melted, until Jack Frost calls a halt in the fall. This is one reason why we should grow more of this class of plants. Another reason is that they fill the bill in every size of a garden, from the capacity of a few dozen, for the cottage, to the broad acres of the millionaires.

The preparation of the soil for a planting of perennials should be most thorough in every detail, if we expect results that shall excell. The work should be of a permanent character. The plan that I have gen-

erally adopted I find works well.

Prepare the beds in the fall by trenching or digging two spades deep. This breaks up the sub-soil. It should be dug and left in a rough condition, at the same time incorporating plenty of good rotten manure, or half-rotted leaves, or both, if the soil is very heavy. This makes the best medium for growing perennials. Give a good application of charcoal, peat moss, fibre or better still, plenty of good, tough sod. These materials will act as mechanical agents to the soil, as well as give fertility, and at the same time will tend to increase its effectiveness as a drouth resister, and a storehouse for plant food for many years.

Deep cultivation is very essential as many of our best perennials are deep-rooting; for example, the Leguminose, Malvacæ, Campanulas, and many others. Nothing suits them better than to get down to the cool reservoirs of moisture and air spaces during the parching months of July and August. The extra trouble of deep cultivation will be amply repaid in the extra quantity and quality of the flowers. In addition they will require less attention as to watering, etc., especially if we have to depend on the rainfall. Trenching not only opens up the soil and allows freedom of root action, but also drains the soil in winter, and renders it moist in summer. The action on the pores of the soil is similar to the action of warm air in contact with a cooler surface or body.

If the ground is of a very sandy nature it is better to neutralize it by the action of cow manure (if procurable). Heavy clay loam with the sod left on is preferable. Wood ashes or lime applied at the time of preparation is also good, as it has a binding effect on the soil, and being very "leachy," heavy mulching at all times is necessary for the best success. In summer it prevents too rapid evaporation and provides a constant stimulus. It acts also as a protection in

I am rather in favor of nitrogenous manures for perennials, especially in the growing of the heavier varieties, although it is necessary to give a liberal dressing of bone meal or granulated bone annually, as leguminous and woody plants depend on the lime salts and phosphoric acid contained therein. On the other hand, there are some plants that do not like lime, e. g., the Foxglove, but they are few in number.

There are two general methods in the planting of a perennial garden. The first is by arrangement of colors for certain sections or divisions. Of course in each case the aim is to have continuity of bloom for the entire season, so arrange the height, natural position, etc. This method might suit those who are partial to

\*Extract from a paper read at the recent annual convention of The Canadian Horticultural Association by W. J. Potter, Parks Department, Toronto, Ont.

certain colors and shades and is easily accomplished. Color planting is more suitable for large gardens, where the eye rests on the whole, or greater part of the scheme. It also includes the choice and use of two colors or combinations, such as pink and blue (light), cream and purple, golden yellow and deep blue, or orange and medium blue; or a gradual blending down from an intense color, using several intermediate shades. The yellow and orange shades always look well and if separated in good generous blocks, cannot help but be effective. Blocks of white flowers or green ornamental foliage will act as a foil where it is necessary to use strong colors in heavy masses, reds and scarlets for example, that is if both meet the eye at the same time. The blue delphiniums, white and pink hollyhocks afford an example of good tones, but keep the reds and maroons away. Gypsophila and purple delphinium form an æsthetic combination. Place Golden Coreopsis against heavy foliage and deep shadows. Plant Foxgloves among an underground of dwarfer material or among evergreens in groups. The composite flowers offer many delightful combinations. One cannot err in their use as the colors, for the most part, can be called relative or harmonious. Examples include Heliopsis and Callimeris incisa, Stokesia and Shasta daisy. These can be used also with Golden Authemis. Rudbeckia purpurea and Rudbeckia fulgida or subtomentosa harmonize, and so on "ad infinitum."

Collections of phlox show off to much advantage if separated as to color, the scarlets from the magentas and the pinks from the purples. Use the white forms

between.

The second method of planting may appeal to those who want to form collections without regard to color arrangements. If so, use plenty of green foliage as a foil and background. This method is the planting of each genera or family in separate masses or irregular bays in conformity with the size and shape of that portion of the bed to be planted. When following this method, make a sketch or drawing to scale and have the framework laid out first with the space allotted to each group. Then plant evergreen shrubs at vantage points. These not only act as foils to certain colors and forms, but also afford shelter in winter from cutting winds and in summer from hot sun for shade

There are many genera which will thus make a continuous show of bloom by judicious placing and the use of the proportionate number. Take veronica, for example. The first one blooms in the spring, and so on till fall, without a blank. Phlox are the same, starting with P. ovata, and followed by Arendsi, suffruticosa, and decussata, giving an unending succession till October. Rudbeckia, helianthus, spiraea, aconitum, campanula, helenium, inula, pentstemon, lychnis, lilium, aquilegia, gypsophila and many other families not including continuous bloomers, can be used in this way. If by chance there happens to be any blank spaces, any of the continuous bloomers in the list fills the bill.

Propagation may be done in a number of ways. The most generally adopted method is by seeds. These should be sown early enough to form good strong plants by October so as to enable them to stand the winter. About June will usually suffice for many. I prefer sowing most everything in the spring, as it takes a long time for many to form good crowns, and it is better to err on the side of size than lose your stock through the winter. Phlox are better sown in

(Continued on page 400)

# Historical Grant's Farm, St. Louis, Mo.

One of the oldest and most historic places in the vicinity of the city of St. Louis, Mo., is the old Grant's Farm. It is located about twelve miles from the city, on the Gravois Road. Its owners, from the first, were people of distinction, but its chief historical interest centers in the fact that it was the property of General (later President) Ulysses S. Grant during the season of his greatest prosperity. Mrs. Grant, nee Julia Dent, was born and reared on this place. It was here also where most of his children were born. Grant's Farm was originally settled by Captain John Long in 1807. He was a revolutionary hero, and fought under General Lafavette. From the Longs the farm passed into the hands of Theodore Hunt, and from Mr. Hunt to Frederic Dent, Mrs. Grant's father, and then to General Grant who, shortly before his death, sold it to Luther H. Conn. Twelve years ago August A. Busch, the present owner, acquired the property, which is now his home.

General Grant lived on this farm from the time of his

by the Eusch family for week-end stays and for parties. During these years the place was particularly noted for its simplicity. The natural features were preserved, as far as possible, the growth of the native plants encouraged and the number of species extended, until now almost all plants, hardy in this locality, are to be found there, growing in natural situations and surroundings, Walks were made through the wildernesses, and to overcome obstructions in the way, as well as to add interest to the scenes, rustic structures of various kinds were built, carefully observing their practical use as well as their proper fitting into their surroundings.

These structures were built of Arbor vitae and white birch, with floors of oak. To prevent their early decay by rot, none of these structures were permitted to touch the soil, but were anchored to concrete piers which projected a few inches above the surface of the soil. After eight years these structures are still in splendid condition.

"GRANT'S LOG CABIN," BUILT AND FORMERLY OCCUPIED BY PRESIDENT U. S. GRANT

marriage to Miss Dent until shortly before the Civil War. About 1854 he built the now famous "Grant's Log Cabin," which is still carefully preserved on the farm. The Grant's Farm contains 250 acres, the greatest part of which is utilized as a park.

Previous to the purchase of the property by Mr. Busch it was utilized for pasture, and at the time was a practically unspoilt wilderness where most of the plants native to this region abounded. With the exception of a meadow of about 15 acres, through which flows the Gravois Creek, the property is very irregular in contour and largely wooded. The principal predominating species of trees are: oaks, hickory, sycamore, western sugar maple, ash, black walnut, elm, hackberry, Ohio buck-eye, red-bud, flowering dogwood, crab apple, wild black cherry, hawthorn, etc.

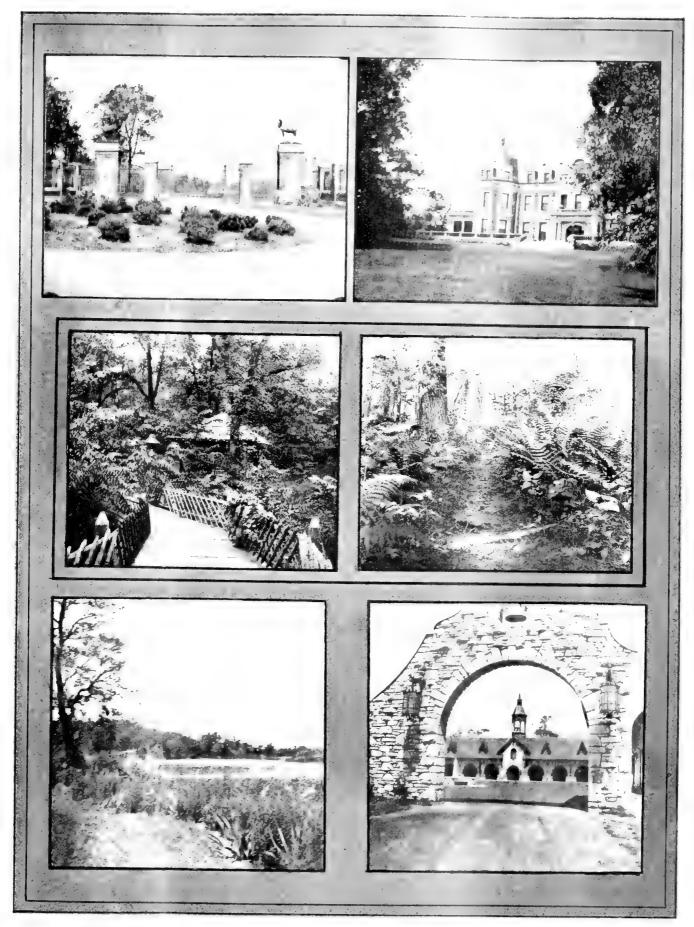

The first development of the property was very simple and consisted of the building of a rustic cottage, barns, artesian wells for water supply, and essential drives and paths. For a number of years the farm was utilized

Five years ago Mr. Busch decided to make Grant's Farm his permanent home, and this meant an entire change of the general lay-out of the place, from a temporary retreat to a gentleman's country home, and in doing this the aim has been to preserve the natural charm of the place and harmonize this with the architectural structures essential for the comfort and convenience of the owner and his family.

The residence is of classic architecture, and is located on an eminence, surrounded by woods. At the entrance front the native wilderness almost touches the balustrade of the building. The garden front consists of closelymown lawn, which forms long open vistas into the distance.

Along the borders of the lawn and along the main driveway are large, irregular masses of introduced hardy plants, intermingling with the native woods in the back-

On entering the main gate, which is constructed to harmonize with the residence, a long vista of meadow,

MAIN GAIFWAY O GRANTS LARD MONG THE WARK THEOLOGICITH WHITER'T VIEW OF LARL NEAR MAIN GALL

TS10(NCL OF MIGUST A, BUSCH AUTHA OF NATIVE FERNS, 17 (RANGE TO THE PAGERNIO)

bordered with plantations, is brought into view. This is followed by an extensive view of a five-acre lake, artificialy made, but, through irregular outlines and plantations, appearing like a natural sheet of water. Now as the driveway curves we have a series of waterviews in rapid succession on the one side, with steep wooded hills on the other.

As we follow the road we get a glimpse of the residence, in the distance, followed by a long, beautiful vista through a valley, in which is located a series of lagoons.

The roadway is now bordered with large trees and shrubs on both sides, with occasional glimpses of the lake, below us, to the right, and in a few moments the entrance front of the residence is reached.

This roadway continues to the service buildings and utility grounds, which are located about 1,000 feet from the residence, but hidden from there by woods and plantations, and from there leads through the woods to the service entrance of the farm.

To see some of the more interesting features of the farm, we will follow one of the walks, mentioned above, entering from the entrance front of the residence; we are at once in the midst of nature. Following this walk we come down a series of steps to the boat-house at the lake, then, along a little further, we have on one side wooded hills and on the other a series of water vistas along a stream, with occasional long vistas into the distance. After crossing several bridges, the walk leads, first, through dense woods, then on to a hillside meadow, with a series of splendid long distance vistas of hills and valleys. We are now approaching the nursery, orchard, vegetable garden, cut-flower garden and poultry yards, in succession, then to the "Bauernhof" group of service buildings.

This is one of the most unique groups of buildings of its kind in this country, in the form of a square,  $125 \times 210$  feet, enclosing a yard with a fountain in its center. This group contains the following departments: Apartments for the farm manager, engineer, houseman, dairymen and hostlers. A beautifully arranged clubroom, garage, dairy, stables for cows and horses, harness rooms and coach room.

Leaving the "Bauernhof" we enter the main lawns, where we get several excellent glimpses of the residence.

Some distance from the residence we cross a long rustic bridge over a wooded ravine, which leads into the herbaceous garden with wooded hills on one side and a series of small lakes on the other. From this walk we get one of the best views of the residence.

After crossing a small bridge, we enter into a ravine, through which flows a small stream, originating from a spring, located at the end of this small valley. A narrow walk leads through this valley, and along this walk and on the sides of the hills are to be found, growing under natural conditions, some 30 species of native ferns. Among the ferns are planted: native orchids, trilliums, hepaticas and other interesting plants of the dense woods.

The above description but faintly pictures the place, which must be seen to be appreciated. It is unconventional in design; it is a paradise for our native birds, which are protected and encouraged, and interesting to the student of our native flora as well as to those interested in hardy exotic plants. It is not as yet fully developed, and it will take years of time until recent developments reach mature effect.

L. P. Jensen, already well known among the GARDEN-ERS' CHRONICLE readers as an interesting contributor to its columns and an enthusiast on everything that denotes progress in ornamental horticulture, has the supervision of this beautiful estate, together with the other properties of the Busch family in and near St. Louis.

#### THE PERENNIAL GARDEN.

(Continued from page 397)

the fall as soon as ripe. This is true also of a few other hard seeds, as many will not keep, such as aquilegia, myosotis and primula. These must be sown as soon as possible. This method applies only to stocks which come true from seed or with which there is no regard for mixture. Any choice varieties, such as phlox, delphinium, guillardia, etc., are better raised from cuttings or divisions.

Cuttings are made early in the spring. A frame or greenhouse is a necessary adjunct for the purpose. By wintering such stocks inside a cold house, they can be raised wholesale, and indeed many will bloom the first season. These cuttings should be taken as short as possible on the side growths or when first starting to grow. Others can be multiplied from the roots, as having running fleshy roots they can be cut up in small pieces, for example, gaillardia, dicentra, lythrum, paeony, etc.

Many perennials can be increased by a system of layers without much trouble, including the dwarfer cushion plants, such as arabis, campanulla, carpathica, dianthus and others. All that it is necessary to do is to cover the plants with clean sand or sandy soil so as to form a mound, but not so thick as to bury the plant. Merely fill up the intervals between the leaves and stems. Some plants are better propagated by earthing up the stems in a similar way; for example, tree paeonies, and some others of a semi-shrubby nature.

The majority of herbaceous perennials are easily increased in smaller quantities by simple division of the roots. Those which have a heavy mass of fibrous roots can be increased in the fall. Indeed, this method of dividing the roots should be carried out every few years, as the quality is better. If this is neglected, the clumps get hollow and woody in many cases, and are liable to run out. These include pyrethrums, delphiniums, phlox, pentstemon, platycodon, aquilegia, aster and a host of others. A constant keeping up of the utmost vigor of your plants is essential both for quality and because they are then less liable to suffer from insect attacks.

It is not the intensity of our cold winters that ruins many plants, but the dry, strong winds in early spring, as well as the fact that water remains on the crowns and forms ice, thus suffocating them. To avoid much of this trouble, see that your border is well drained and encourage as much of nature's covering—snow—as possible. To this end do not clean the border off too clean and bare in the fall; in fact, no more than is necessary. The more material that is left on in the way of a rough coating of leaves, etc., the more snow is liable to find a lodgment. In the case of evergreen plants, I find that pieces of hemlock or spruce branches placed around them helps wonderfully. Do not cover these evergreen plants with a heavy mulch, as it will do more harm than good. They need air at all times.

#### AMERICAN SWEET PEA SOCIETY.

A committee appointed by President Gray, to pass upon the Sweet Peas grown in Newport on account of C. C. Morse & Co., California, have awarded certificates to the following varieties: Jessie Cuthbertson, New Meriam Beaver, Duplex W. T. Hutchins.

(Signed) ULLIAM MACKAY

## Things and Thoughts of the Garden

By The Onlooker

When one considers the vast amount of distinct, handsome plants that grow wild in the meadows, lanes, glades, copses, hills and uplands, as well as in the marshes and by the seashores of our land, many of which are in the height of their beauty at the present time, it does seem remarkable that hardy flower gardening is, comparatively speaking, so little developed in our gardens. It is by no means neglected; not for a moment is that suggested; but the question might well be asked whether all is done that could, might and ought to be. Lately a good deal of attention has been directed to alpine or rock gardening, and signs are not wanting that there is to be a return to the former keener interest in this feature of outdoor horticulture.

I have to confess that my surmise as to the former higher regard for hardy plants is based not so much on personal experience or study of the history of the subject as from the former greater efforts the trade made to advertise hardy stock. Look back fifteen or sixteen years and see the full page ads. that such a firm as Dreers had at that time. Or was this merely pioneer work of theirs? Lists of one hundred and fifty different kinds of hardy perennials were offered, and as the advertising was well continued it would appear that it met with support. Yet if such heavy advertising is not the rule now, it may be that it is more widely diffused. More firms are now in the business and the tendency has been and is to specialize.

Reverting for a moment to the native hardy plants, have we fully appreciated the merit and diversity of them? Take the following list as merely representative of a much longer catalog that could be written:-the Asters or Michaelmas Daisies, the Goldenrods, of which there are some forty species, the superb Swamp Lily, the stately perennial Phloxes, as well as the dwarf ones that bloom in the Spring; the pretty Erigerons, of which there are several natives of this country that are much prized in the gardens of France, Germany, England, and other European countries. At the present season of the year the gardeners across the Atlantic think our Arrowhead (Sagittaria variabilis) one of the gems of their watergardens, along with another American plant, the Pickerel-weed, Pontaderia cordata. In passing, I might ask if anything more lovely could be imagined than a vase of the Sagittaria, above-mentioned, arranged with the Maidenhair-like foliage of the Tall Meadow Rue (Thalictrum polygonum)? Others of our native plants that are prized abroad if not so much with us, are the Port Wine Plant or Pokeweed (Phytolacca decandra); the Evening Primrose (Œnothera biennis); the Jewelweed (Impatiens fulva); the Shrubby Cinquefoil (Potentilla fruiticosa); together with Eupatorium purpureum, Asclepias tuberosa, Malva Moschuetos, Verbena hastata, Rudbeckia hirta, Veratrum, Tradescantia, and many another.

With all these excellent subjects we have also an admirable opportunity for wild gardening. The owners of some estates do practice the sowing of the choicer native plants and shrubs. I remember seeing half a mile or more of railroad embankment covered with Spanish Broom, and the sowing had been made, curiously enough, by the Mr. Robinson already mentioned in these notes. He was in the habit of filling

his coat pockets with the seeds of this shrub and as he walked along, used to scatter it. In this way places that before were bare and uninviting were converted into places good to look at. The railroad company was not averse to having its property improved either, since it cost them nothing. The Spanish Broom, of course, is not hardy with us except down South, but what about Gorse or Whin, Common Barberry, Pepper Bush, Rhododendron maximum, Hop, Clematis, etc., together with colonies of the more vigorous perennials?

The main requirements in the making of a successful herbaceous border are a good soil, deep and holding if possible; secondly, enrichment in the form of yard manure or fertile leafmold; thirdly, young, clean stock, either freshly raised or old stock divided; lastly, close planting. Some folks will very likely raise objections to this latter piece of advice, but the reasons are these: that the plants not only look better in the mass but support themselves to a large extent in the Summer and, most important of all, they afford shade and protection to each others' roots in the hot weather.

In regard to the system of grouping or planting, opinions differ about as much as it is possible to. Besides the mixed border, which is the most common, there is the border that is planned for color effect, such as the blue, the white, the grey, the orange, and so on. While these are exceedingly interesting and exhibit knowledge of hardy plants and skill in how to employ them, still, for everyday use and the widest utility, the old-fashioned mixed collection will generally be voted best. Let the plantings be in ample masses though, or to be more definite, say a three feet by three feet grouping, whether it be round or drift-like. That is a very small planting even for such things as Achillea, Dianthus, Campanula, or similar dwarf growers. Of the plants that are soon out of flower, like the Peonies, and which are apt to leave a dull patch the rest of the Summer, one good plant by itself in one place seems to me to be sufficient. It will test the skill of any gar-dener, however, to maintain a moderate display of bloom through the season, from May to October. Can it be done? Only by the exercise of the greatest forethought. Even then, so far as the writer's experience goes, it has always been necessary to supplement the permanent framework, so to speak, with a certain amount of "bedding." But this "bedding" precludes most of the plants that are associated with the parterre or formal flower garden, with its Begonias and Geraniums. Such subjects as Verbena venosa, Calceolaria amplexicaulis, Nicotianas, Polygonum orientale, and others that will arise to mind, are one and all suitable and even desirable. Certainly these must be raised, grown on to a decent size, and kept ready for use wherever wanted, which is a very easy matter indeed. No place of any pretention should be without a reserve space or garden from which to be able to draw either plant stock or cut flowers. Now is the time when we have more leisure to think out these planting problems, and with paper and pencil during the lengthening Autumn evenings, plan and prepare for better things ahead—greater triumphs yet.

Washouts are all too common—commoner than they need be if we would only channel or fix up the sides of

•

our paths and driveways. Cement is sometimes used for channeling, so also is brick and stone. Of the three the brick is the most to be commended, but its expense generally puts it out of count. Whatever is used, see to it that there are sufficient sink-holes. If greater care were taken with the sides of our roads and paths, much less damage would be discoverable so far as washouts are concerned.

\* \* \*

We are now well through the Gladiolus season. The weather has been very favorable to the growth of the bulbs (corms), and there have been some fine displays. Many amateurs have been induced, in the last year or two, to take up their cultivation with a view to the sale of the flowers in the market. The result of this has not been profitable either to them or to the bona fide commercialist. The Gladiolus is of the easiest culture, although, as in the case of most hardy or outdoor "bulbs," good treatment brings forth the highest expression of the flower. This reminds me that at the present time, when we are potting the Dutch bulb stock, we might as well take note that a piece of nice loam and spent Mushroom bed manure and a quarter part of clean sand is far better than trying to get results from old compost, even if it has been enriched with boneflour, soot, or any of the prepared fertilizers. Old Chrysanthemum soil, since it contains the decomposing roots of the 'Mums and is rich, is not a bad material to make out with. At any rate, give the bulbs something to live on.

From the market growers' point of view the returns from the Gladioli recently have been worse than disappointing: in many instances it did not pay to cut and send to the wholesale florist. The prime favorite throughout was the variety America. A close second was Mrs. Frances King. Others of the best are Mrs. Frank Pendleton, Baron Hulot, Niagara, and Badenia. I must say a good word for Burpee's Fordhook Hybrids. It is a fact that from a sowing made in February, blooms can be cut in September of the same year. This is surely quick work, and reminds one of the peaches in California which can be fruited in sixteen months from the sowing of the stone. The seed of these Hybrids is sown in a heated frame, in rich light soil, and by keeping the young stock watered through the Summer, a small percentage will flower in September or earlier, as stated. This Fordhook strain is in all the colors that one could wish, except blue. Another strain that is engaging attention is the primulinus group. These are very dainty, bearing moderate sized flowers on long stems and having prettily hooded shape. The colors are soft yellows, salmon, rose, and similar combinations. It is a pity that the hooded form is in danger of being bred out; the type ought to be kept true.

We are now in the season of the Dahlia, truly one of the great plants of the day; but indeed it has been a favorite ever since the oldest of us can remember—and before. In next month's Chronicle something may be said of the season's varieties; but meanwhile the question may be asked why the useful miniature cactus kinds are so totally neglected. Pompon cactus is another name they go by. They are particularly suited for the smaller gardens, or for the front of a border. The midget type of singles is also less seen than they might be. It is only in first-class collections that all the numerous types are found, and even the fanciers tie themselves down to cactus, Peony-flowered, decorative, pompon, and doubles, i. e., shows and fancies.

Recently the large Twentieth Century singles have also been much in vogue. All have their points of merit.

I was interested and amused at a review of Mrs. Francis King's newly published book in an English gardening paper. The reviewer was Wm. Robinson, a man of much eminence and experience, not only as a practical gardener and landscape gardener, but also as a journalist. It was in his own paper, Gardening Illustrated, that the review appeared. Mr. Robinson, whom I know personally, deserves attention, and has indeed exerted a mighty influence insofar as the hardy plants and their use in gardens is concerned. When he began to advocate the greater use of hardy garden flowers some 30 or 35 years ago, his was as a voice in the wilderness, but gradually he and his backers gained a larger following until today the hardy plant cult is the most vigorous of any in the United Kingdom. Mr. Robinson's estate is in Sussex, one of the lovely Southern counties, where he purchased a neglected place many years ago, and began by thinning out the large trees and planting young forests and woods, also greatly improving the gardens, until today the Elizabethan manor and the surrounding grounds are among the most desirable and valuable in that splendid county. He, however, has become more and more intolerant of other people's views in regard to gardening and design, and has from time to time lashed out in a realy unmerciful manner against the book producers. So much is he prejudiced or biased in regard to his own ideas that he can see no good in any other person's. His vehemence lends a spice and relish to what he writes so long as one can look at it in a detached and merely amused manner, for the looker-on always has the best position. As Mr. Robinson is now well over 70, it is unlikely that he will now become any more tolerant of the opinions of others. People, however, grow tired and heedles of the carping critic if he carps too long, or fails to add logic to his invective.

This month (September) and the early part of next month is the time when we plant evergreens, be they large trees or small shrubs for winter bedding. Do we use these evergreens abundantly enough? For myself I think not-decidedly not. For filling beds and borders close to the residence the following deserve attention: Rhododendrons, Enonymus Japonicus, various Retinisporas, particularly squarrosa and plumosa aurea. Also Japanese and canadian yew, which are very hardy. Small hemlocks also always look well; also box, American holly and Osmanthus ilicifolius. Engelmann spruce and Koster's blue spruce are much employed, but they seem, especially the latter, to scream out for notice wherever they are and spoil the harmony of so many plantings. It is very difficult to employ them correctly and effectively. Biota aurea must find a place, it is so neat and compact. Pinus strobus nanus and Pinus Mughus are each pretty and dwarf, useful for "bedding." Arborvitæs, Juniperus chinensis, J. Sabina, dwarf Norway spruce and Cryptomeria elegantissima are other subjects that can be used. This, however, does not fully exhaust the list as investigation of the catalogs of some of the good nursery firms, such as advertise in the GARDENERS' CHRONICLE OF AMERICA, will prove. Evergreens give warmth, shelter, beauty, and add interest to the garden and home surroundings in winter and spring, and most of our gardens can do with quantities more of them and be improved.

The Society of American Florists and Ornamental Horticulturists held its annual meeting and exhibition (Continued on page 404)

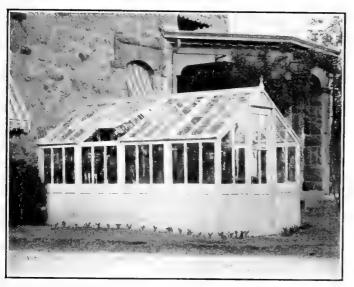

## That Little Greenhouse of Mine

By L. W. C. Tuthill, New York

Mrs. Lovell should have told this little story herself; told it because in my telling much of her delightful enthusiasm can but be lost. However, her reply to my first question of: "What did you grow in it?" struck the keynote when she replied: "Mostly fun—a great many flowers, but mostly fun." Then followed a regular fullisade of questions. On the following pages are given in brief some of Mrs. Lovell's answers.

"How did I come to have this little greenhouse?" Well, in the house below here, on the corner, where we used to live, there was a little half-conservatory, half bay-window affair that afforded me endless pleasure. You see, I was a city girl, and to bring me out here in the country away from the activity and excitement of its life, meant a call for some substitute to occupy my time and thoughts, and the growing of flowers proved in my case the happy, healthy solution.

So when we moved into this house something had to be done, as my love for growing things had become one of the delightful parts of my life. As the house is of stone, which meant endless tearing out, to build on a little con-

MRS LOVELE'S TILLE GREENHOUSE.

servatory, such a thing seemed impracticable, and besides there was some uncertainty how long we might remain. So I looked about, and with the help of my ever-readyreference friend, The Garedn Magazine, found that it was possible to buy for a surprisingly small amount a portable greenhouse which looked to be just about the

thing we wanted.

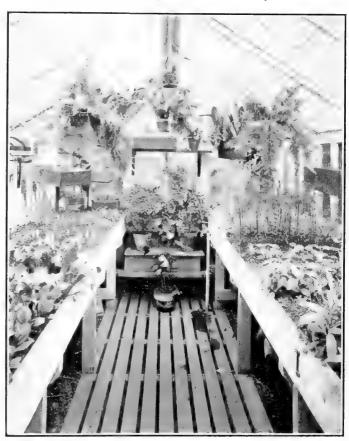

We ordered it and in a few days' time came all the materials, ready for immediate bolting and screwing together; and with them two men, who in an incredibly short time and set the iron posts that serve for its foundation, and the house was bolted to them; the plant-benches were put in place with their heating-pipes underneath. and a hole made in the foundation wall of the house to connect the hot-water pipes with the little boiler in the cellar.

When I saw them putting in a toylike boiler, my misgivings were many; but the toy soon proved itself a most dependable little friend and kept the house at 75 degrees all Winter long, with no trouble whatever. In truth, our first difficulty was in controlling the heat.

 $^{\circ}As$  fold by Mrs. ( ). H. Lovell, of Madison, N. J., who clear with the author.

"Did I really get right out in the house and dig and fuss with the plants?" ()f course; therein lies the best part of the fun. These poor benighted people who do not make friends with their flowers lose the very best part. And don't laugh at me when I say that flowers know their friends—actually know them just as dogs or cats do-and

"What did I really grow?" Well, take these two rooms for instance, with their five windows each; all Winter their window-sills were filled with blooming plants. Stocks we had in abundance, which as soon as the blooms "showed signs of fatigue" were taken back to the greenhouse for rejuvenation, and others brought, giving us a continual round of bloom. Stocks are decidedly satisfactory in every way, being particularly free from insect pests. And

VIEW OF INTERIOR OF GREENHOUSE, TAKEN LATTER PART OF MAY, WHEN MOSTLY FILLED WITH BEDDING PLANTS.

speaking of insects we had no real trouble with them, as once a week the ventilators were shut down in the afternoon, and tobacco-paper burned and the fumes left till next morning to accomplish their deadly bug work.

You will be surprised to know that our eight orchidplants thrived as if they were in their natural Brazilian haunts. The florist told me how impossible it was for an amateur to make them live and all that sort of thing, but, nevertheless, we had eighty of those exquisitely shaded lavender and purple blooms.

Then there were ten pots of freesias which held their heads high in full bloom for Christmas Day; not to mention the joyous golden sunshine of the daffodils-both trumpet major, minor and all the other trumpet kinds.

A comforting little patch of forget-me-nots always reminded me that the sky was blue no matter how gray the clouds were.

You know what tough-skinned, flavorless things the tomatoes are that you buy in Mid-winter; well, you ought to have seen our two vines which were trained in a single stem up the roof—it was quite an event when deliciously meaty tomatoes were served from our greenhouse, not in abundance, of course, but more than you would think two vines would grow. Next Winter we shall have more.

One gardenia and two camellias were most responsive, and considering the price the Fifth Avenue folk were paying for theirs, our thirty or more blooms from the one

plant were decidedly satisfying.

"What of the failures?" They really were few considering the fact that most of my friends spoke discouragingly, and the florists of whom I asked occasional advice shook their heads in a grandfatherly way. Three lessons we did learn—that snapdragons grow too tall and take up too much space in a small house—that carnations are coolheaded chaps and resent June temperatures—that it is a great temptation to fill the benches "too chockful," as our man Friday remarked.

Perhaps I have dwelt a little too much on the pleasures of such a house, but it has a very practical side as well, and that is the starting of plants for early setting out in the Spring. We grew in flats, hundreds of asters, cosmos, dahlias, ageratum, calliopsis, cockscomb, delphinium and stocks, not to mention peppers, lettuce and tomato-plants. In an average spring season such plants will give one several weeks' start over garden-sown seeds, but in a Spring as cold and discouraging as this one has been, it is a wonderful help. One of our neighbors, for instance, is just setting out his tomato-plants that look rather spindly (said in a whisper), while ours are stocky and already have green tomatoes on the size of hickory-nuts.

To me, the greatest value of this little house is the satisfying way it bridges that restless period between the dull dreary days of late Autumn and the fickleness of promising April. People growl about the trains—about the snows—about the slowness of the country, and keep themselves in a perpetual state of discontentment, when they might just as well take advantage of Nature's natural pause and get acquainted with what she stands waiting to do for you, if you will only friendly up to her flower-children and give them a warm, cozy little house to winter in. It is better than all your new thoughts, all your sanitoriums—all your nerve-tonics—because it is natural, and to be natural is to be reasonable, which is only another way of saying health and happiness.

#### THINGS AND THOUGHTS OF THE GARDEN.

(Continued from page 402)

at San Francisco in the third week in August. This national society is ostensibly a gardeners' society as well as a florists' one, and is intended to support and encourage the interests of professional gardeners; but in later years the S. A. F. has been obliged, whether it wished to or not, to devote practically all its time to matters of purely business concern; that is to say, to legislative, advertising and financial discussions pertaining to the commercial side of the horticultural, and particularly the floricultural, industry. The professional gardeners, moreover, have a strong and progressive society of their own—the National Association of Gardeners-so there is no need to worry, nor any need at all to complain. Ours is a many-sided calling, divided into the seed trade interest, the nursery trade, the florists, the parksmen, the landscape engineers, and last but not least, the professional gardeners. The time has come when each must attend to and solve its own problems. Each requires its own organization.

Under these large central associations there are the numerous local clubs and societies, as well as the totally distinct State horticultural bodies.

A great deal has been written and spoken in the past in regard to the commercial cultivation of bulbs in this country, particularly such kinds as come from Holland. In Washington State the Federal Government has its experimental farm and has gone so far as to colonize Hollanders there so that the skill necessary for the proper cultivation and propagation of hyacinths, tulips, narcissi and other bulbs may be ensured. We have also proof of the success of bulb culture, particularly tulips and narcissus, in Massachusetts, northern New York, Tennessee, Virginia and elsewhere. Given light sandy soil that can be well enriched with farmyard manure or similar organic material and fertilizers, there is no reason in the world why many hundreds of acres in all our large estates could not be devoted to the successful cultivation and selection of vigorous growing tulips and daffodils.

\* :

Considerable attention has been directed within recent times to the value of the graceful pinnate-leaved tree named Kölreuteria paniculata. Those who know it well and have made the closest study of the street trees and trees for parks, are unanimous in saying that it succeeds in a great variety of positions, and always looks graceful and pleasing. So far as the writer's experience goes the Kölreuteria seems to have a tendency to grow somewhat lopsided, crooked or much branched, but this may be, of course, through direct want of attention. No one can gainsay its beauty, and the real charm and attractiveness of its foliage. It also bears panicles of attractive vellow flowers. It is a Chinese tree, yet it does well not only in this country but in European gardens. Some one has suggested that its name is against its having become more popular, as there is no common name attachced

In looking over some notes in reference to greenhouse plants in English gardens, I was struck by the great diversity of kinds therein grown, and which are all too uncommonly seen here or even totally neglected. Very few gardens have what one would consider a large and interesting variety of green-house or warm-house plants. Of course, the gardener is not to blame, as he has to supply in so many cases almost unlimited quantities of the best decorative plants for indoor use as well as cut flowers and to do this requires all the space of glass at his hand. Where, however, the owner is a real lover of plants and flowers the gardener has a chance to introduce quite a number of subjects that otherwise are seldom seen. Take, for instance, the following list: Humea elegans, Leonitis Ieonurus, Impatiens Olivieri, Rehmannia angulata and R. Henryi, Streptosolen Jamesoni, Ericas and Epacrises in variety, Acacias, Ruellia macrantha, Exacum macranthum, Centropogon Lucyanus, Eranthemum pulchellum, Selaginella Watsoni and half a dozen other most beautiful kinds, Eupatorium ianthinum, Clerodendron fallax, Heeria rosea, Browallia speciosa, Plumbago rosea, Lobelia tenuior, Rochea falcata, scented Geraniums, Epiphyllums, Reinwardtia trigynum, Trachelium caeruleum, Medinella magnifica, Justicia carnea and J. myriophyllum (yellow). The semperflorens Begonias make good pot plants, and these various plants, together with forced bulbs, forced shrubs, annuals like Schizanthus, Alonsoa, Clarkias, etc., and Amaryllis, Cyclamens, Primulas, zonal Geraniums, Carnations and so forth, furnish something of value all the winter.

## Some Phases of Floricultural Education

By Arno H. Nehrling, Massachusetts

In order to appreciate fully the subject of floricultural education and the methods that are being followed in this progressive age by our American agricultural colleges, it is necessary at the outset to have a conception of the nature and scope of these great public institutions. These institutions are the outgrowth of the so-called agricultural societies which came into life late in the eighteenth century and immediately following the American Revolution. The immediate results of these societies was an agitation for agricultural schools and a number of such schools were actually established, one in Maine in 1821 and one in Connecticut in 1824. The natural conditions, however, did not seem to justify this movement on an extensive scale and it was not until the great West began to develop that the agitation for agricultural schools became apparent. This was in the late forties and fifties. At this time college education was primarily the business of the church and colleges existed on private subscription. The agricultural colleges were supported by private subscription and the struggle for existence was pathetic. At that time Pennsylvania and New York had agricultural colleges, but the movement came to an abrupt end about the time of the beginning of the Civil War. Only one state, namely Michigan, fared a little better. Here in 1850 about the time the agitation was at its height, some far-sighted man introduced a clause in the constitutional convention making it obligatory upon the state to establish and maintain a college or school of agriculture and in 1857 the college was opened for students. Many of our pioneer agriculturists and horticulturists, among them L. H. Bailey, Eugene Davenport, and our President Butterfield, received their education at this institution. Further development occurred in 1837 when Justin P. Morrill, then a member for Vermont serving in the lower House, introduced a bill into Congress providing a grant of land to each state for the purpose of establishing agricultural and industrial institutions. The bill had the usual experience of new projects. Once it passed both Houses, but it was promptly vetoed by President Buchanan. It passed again, however, and was approved by President Lincoln, July 22, 1862. Thus did the United States in the early days of the Civil War lay the foundation for a national system of agricultural and industrial education and thus originated the so-called Land Grant College. Each state accepted the lands and proceeded to establish its college according to its local conditions and its peculiar interpretation of the Morrill Act. In the East wherever there were struggling colleges, the land grant was turned over to existing institutions, whose faculties knew little and cared less about what the law intended to accomplish. In the West the funds were quite generally used to start state universities that too often operated in the interest of general education without devoting much energy to the propagation of the peculiar educational ideals which the Morrill Act was supposed to establish. In the Middle West an intermediate course was pursued. Michigan and Pennsylvania already possessed each an agricultural college. In both cases the proceeds of the land grant were at once turned over to these institutions, and all energies were devoted to agriculture, ignoring for many years the mechanical interests provided for in the act.

These new institutions simply did the best they knew how as they were without teachers, without matter, methods or ideals and above all without an enthusiastic

\*Professor of Floriculture, Massachusetts Agricultural College, Amherst, Mass.

clientele, for farmers at that time generally ridiculed book farming. This, however, is not the case today, which is clearly illustrated by the large attendance at the various colleges of agriculture. Illinois in 1900 had nine students and two teachers. At the present time they have between 700 and 800 students and over 100 men in the faculty. The development at Cornell has been still greater and here in Massachusetts gains in enrolment are significant.

Of all the separate agricultural colleges that of Massachusetts founded in 1863 is the only one strictly agricultural. The work of the other overlaps more or less and in addition to the agricultural work they consider

other subjects such as engineering.

The agricultural colleges of today contain many departments and horticulture is usually one of these departments coordinate with others. The first institutions to develop horticulture as a separate subject were Michigan in 1867 under W. W. Tracy, and New York in 1874 and Ohio and Iowa in the order named. At our institution courses in Botany and Horticulture were offered by Prof. Clark, then President of the College, as early as 1878. In 1896 further development occurred and at that time all the so-called horticultural work was turned over to Prof. Maynard. This work included pomology, floriculture, market gardening, forestry, plant breeding, etc. In 1902, Prof. Waugh came to the college to take charge of this work and the actual development of the work dates back to that time. The time soon came when he could not handle all this work and in 1904 the floricultural work was turned over to Mr. Francis Canning. There was a popular demand for this work and in the fall of 1906, the College realizing the value of trained men in this branch of horticulture, began offering a specialized course in floriculture under the direction of Prof. E. A. White. In 1908 the courses became still more specialized and from the meagre beginning has developed the present Department of Floriculture. About this time a number of other state institutions began to divide up the horticultural work. Illinois in 1908 established a Division of Floriculture and Cornell, although more or less complete courses in floriculture were offered under Prof. Bailey's direction, has since then developed a strong department. Other institutions are offering work along floricultural lines, but the work is not as highly special-

Before discussing the individual lines of work considered under the heading of floriculture I would like to mention the fact that the Missouri Botanical Garden (Shaw's Garden) has since 1885 given special attention to the training of men for floricultural pursuits. Henry Shaw, the founder of the Garden, having in mind the development of efficient gardeners, in his will of January 26, 1885, inserted this paragraph;

"I declare my intentions that instruction to garden pupils shall be attended to, both in practical and scientific horticulture, agriculture and arboriculture. I leave the details of instruction to those who may have to administer the establishment, and to shape the particular course of things to the condition of the times."

The Board of Trustees, on assuming control of the Garden, gave this feature of Mr. Shaw's will their very early consideration. In December 1889, the first announcement concerning Garden pupils was issued. In this we find the following: "In accordance with the intentions of its Founder, the Trustees of the Garden propose to provide adequate theoretical and practical instruction for young men desirous of becoming gardeners."

The system used in this instructional work was modelled after that in use at the Kew Gardens, England, and floriculture was from the beginning the most important phase of the work. This system has been giving excellent results and these courses have actually been the foundation for the work we are giving today. The important factor in this course is the emphasis that is put on the practical work as it gives the student the assurance and confidence that he understands the tasks set before him and the best ways to accomplish them. In this country today we owe much to the European trained men who received their training under a similar system.

Coming back to our problem of floricultural education, it is my firm belief that floriculture in all its phases is becoming more and more scientific; that is to say, more and more dependent on the result of scientific research and discovery and surely it must give a man greater confidence and power if he has had a term or two at a school or college where the subjects in which he will be engaged in the earning of his livelihood are highly specialized. Above all, of course, he must have practical experience: that is taken for granted, but if he understands plant life, chemistry, the habit and structure of insect pests, and the life history of fungi and other such things, he is surely a better man at his vocation. Practice with science, in other words, is the ideal for which we should strive and we are following this plan as far as existing circumstances will permit. Our system is by no means ideal; it will take years and years to develop methods such as those under which our successful gardener of the present day received his training.

We have done our utmost to keep up with the wonderful progress that is being made in all lines of floricul-

tural work.

In selecting the allied subjects which aid in rounding out a well balanced course in floriculture, only those giving the most beneficial training have been selected. The value of the course lies in the strictly scientific and fundamental training. The object of the work, then, is not to turn out specialists or men who have mastered all the details of practical work. If a man wishes to specialize along any particular line, he must first obtain this practice on some up-to-date establishment. In this connection I wish to say that we always urge our men to go into practical work during the summer months and vacation periods. I think the time is near at hand when every student taking a course of this nature will be required to have at least one year's practical experience before he receives his diploma. The Rhode Island Agricultural College has just recently passed a ruling to this

As a separate college course the floricultural work is comparatively new. It only approaches the apprentice system, the Kew and Edinburgh system, under which our successful gardeners of the present day received their trainings. I have often heard the statement that there are no good American florists and gardeners. This is true to a certain extent and for this reason it is our duty to see that any one who wishes to go into this work should have only the best educational facilities and training. So this problem which we are trying to solve is your problem as well as ours, and you practical gardeners and florists can be of great assistance to us.

While I fully believe that the gardeners and florists of today are as progressive and broadminded as any other group of professional men, they have been slow in encouraging this work and in giving the coming generation a better foundation for the profession which has made such wonderful strides the past twenty-five years.

That a man in choosing this line of work must have a love for nature in order to be successful is a well known fact. It means more than watching and waiting developments. To my knowledge there is no line of work where the duties are more exacting.

That more has not been done along the lines of floricultural education is not so much the fault of the institutions as the fault of the people. Before we can expect active support we must prove to you people that we are working along the right lines-in other words, we are after results. As the work is still in its infancy it is rather difficult to give you accurate figures; however, I can say frankly that nearly all the men who have actually gone into this work are today fairly successful. I am keeping close watch on the men who are going out from here and in a few years I hope to give you more detailed information on this point. To the question "Does the instruction given along floricultural lines in the agricultural college influence floriculture?" I can only say that we are creating new interest. The key note of this new interest is better methods, business organization and a knowledge of the scientific principles underlying successful practice. Education along general agricultural lines seems to be remarkably successful, and I see no reason why we should not be equally successful along educational lines in our highly developed specialty.

#### THE HERBACEOUS PHLOXES.

These useful hardy flowering plants are equally as valuable for small as for large gardens. From the middle of July onwards they continue to produce an abundance supply of flowers until the damp days and nights destroy their beauty. The few first frosts do not usually do them much injury, at least, not to the same extent as damp. The soil best suited to their successful cultivation is a good loam not of too light a nature, as when this is the case there will be a tendency to suffer from drought in dry weather, and this should always be carefully guarded against. A position that is tolerably moist and cool during hot weather is well adapted for their requirements. When this can be secured, even with a less amount of sunshine, it is better than being too fully exposed to the heat and drought. Poor soil, or that which is light and gravelly, should be enriched with cow manure previous to planting, being deeply dug at the same time. They thrive very well indeed in a heavy loam with a tendency to clay. Whenever they are found to grow freely and flower profusely it is not a good plan to add much manure, but better to leave them for a few years as they are. After a time they will show signs of weakness, then the best plan will be to add manure to the soil or remove them to a fresh piece of ground. When this is being done the clumps may be divided as necessary. This is a very good and simple way to cultivate them for all general purposes. Where, however, more extensive propagation is necessary, or when plants of extra vigor and strong spikes are the chief aim, then propagation should be by means of cuttings taken off just when of sufficient length in the spring and struck in sandy soil in pots in a cold-frame. When well rooted these may be planted out permanently or left in pots and plunged for the first year, and planted the following spring when commencing to grow. This plan gives rather more trouble, but no doubt better plants are thus obtained. Large established clumps always throw up a superabundance of shoots every spring; as soon as the strongest of these can be fairly distinguished, all of the weaker ones should be thinned out sufficiently for each shoot to develop without being drawn up weakly. Those growths remaining will thus increase in vigor, and at the same time remain more dwarf and compact with less need afterwards of any undue amount of staking and tying, (Continued on page 408.)

## Work for the Month of October

Conducted by Henry Gibson, New York.

THE FLOWER GARDEN.

Lifting, dividing and resetting of hardy perennials that have become too crowded should be completed as

soon as possible this month.

Most hardy bulbs are obtainable now and should be planted at once. Crocusses are better for early planting and a sunny location suits them best. Scillas of all kinds succeed best in the shade, and for the size of the bulb require to be planted comparatively deep; 4 to 5 inches is not too much. They will multiply rapidly if allowed to seed. Snowdrops, Chionodoxias, Grape Hyacinths and the graceful Camassias should be covered to three or four times their depth, and to produce a really striking effect, thick planting is essential.

Hyacinths, Tulips and Narcissus that are to take the place of the summer bedding plants, should not be left out of the ground too long. It is generally conceded that this work should be completed in two or three weeks after the maple leaves begin to drop from the first frost. A layer of sand beneath the bulbs is always advisable, especially on heavy retentive soils. Green animal manures should not come in contact with the bulbs, but be buried at least 6 inches beneath the base of the bulbs when planted.

This department should receive a thorough cleaning up in order to maintain a neat appearance as long as possible. Cut down all dead stalks and clean the spaces between the plants in readiness for the winter

mulching that is to be done later on.

#### TAWN AND GROUNDS.

Bay trees, Hydrangeas, Oleanders and similar plants that have been used for decorative purposes, must now be placed where they can be taken inside on frosty nights. Do not, however, take them inside too early or they will get soft and winter badly. Lily ponds should be drained off and protection afforded the more tender plants. Wrapped in clean straw, many of the tender Nymphaeas winter well in a cold frame. The transplanting of deciduous hard-wooded trees and shrubs should be pushed ahead. Such trees as birch, oak and beech are perhaps better moved in spring, but any of the others are as well planted now.

Keep the lawn cropped close right up to freezing weather. If a late fall growth is left, it usually dies during the winter, which not only looks unsightly, but seriously hampers mowing operations in the

spring.

All loose vines should be securely tied before they are broken by being blown about by boisterous winds.

#### THE VEGLEVEL GARDEN.

Onion sets for spring bunching may be planted now. Killing frosts may be expected in many sections of the country this month, and tender vegetables should

have some protection.

Strings or wire attached to short stakes, run the length of the rows, will prevent the protective material from breaking down the plants in the case of string beans or bush limas. Pole limas are not so easily protected, but by pulling up the poles and loosening the vines they may be laid on the ground and covered. A few barrels placed near the egg-plants and peppers are useful for slipping over these plants on a cold

night. Salt hay makes an excellent covering for lettuce and endive. Spinach may be similarly treated. Late celery may still be earthed up. It requires a good deal of attention now, as it grows rapidly at this time.

New asparagus beds may be planted now. Some protection during the winter will be necessary, but asparagus starts into growth early in the spring, and by fall planting one has the advantage of an early start.

Carrots, beets, chickory and other root crops need to be gathered and stored now. Do not put away any of these vegetables whilst wet, nor do not store in a damp cellar unless a raised platform is made to place them on.

All late fruits should be picked before there is danger of freezing. New fruit trees other than peaches may be planted. Peaches do better when spring planted.

#### A LIGHT ABLIS UNDER GLASS.

The first crop of vegetables, such as cauliflower and lettuce, should now be ready for benching. Beans may also be sown in the greenhouse. Beets and carrots for winter use should be sown at once. Radishes may be sown between the cauliflower in the benches. Cucumbers for fruiting in late winter should be started now.

#### THE ROSE HOUSE.

Now that ventilation has been reduced, and fire heat again required, a sharp lookout must be kept for insect pests. Red spider is a factor to be reckoned with, and green fly is a common enemy. The plants should continue to grow freely, and liberal treatment as regards watering, feeding, heat and ventilation should be given. Keep all the air possible on at night except in severe weather, so as to keep the plants as hardy as possible.

#### CHRYSANTHEMUMS.

Chrysanthemums will be showing color early this month. Fumigate the houses thoroughly just before the buds burst to insure the flowers not being infested with black fly. Stop feeding as soon as the buds show color, save perhaps an application or two of soot water, which will improve the color. Watering should be done with care and the floor dampened down only early in the morning so as to leave the house as dry as possible over night. Condensed moisture settling on the petals of the expanding blooms at night soon starts them to damp off. Less and less water is required as the blooms mature, and we find it good practice to do any watering that is necessary late in the day with a can. A free current of air should be allowed to circulate through the house by keeping the side ventilators open a few inches, setting up, as it does, a steady upward movement of air through the top ventilators. On damp, heavy nights a little heat in the hot-water pipes will rid the atmosphere of that cold, dampy feeling and prevent moisture condensing on the blooms.

#### FORRALNE AND CINCINNAFI BEGONIAS.

These subjects are now sending up growths that will make them charming plants at Christmas, and this is the time to attend to the tving and staking. This

should be done so that the plants assume a natural appearance. Raise them close up to the glass, by erecting a temporary bench on top of the permanent one if it be low, or by means of invented pots. The shading may be reduced from now on and the plants gradually inured to full sun. Fumigate to keep green fly and thrips under control. A layer of tobacco stems between and under the plants does much to keep insects away. Ventilate carefully now that we are running into shorter and cooler days. The temperature should not go below 55 degrees nor exceed 70 degrees at night.

#### MISCELLANEOUS PLANTS.

Poinsettias should be kept in a minimum temperature of 60 degrees at night to prevent loss of foliage. Cinerarias and Primulas should be potted on as they require it. Lilium formosum may be potted now. Stocks of the various bedding plants should be prepared. Bellis perennis, Mysotis, Pansies and other perennials still in the seed bed may be transplanted into cold frames.

## FRUIT CULTURE IN POTS. By W. R. Fowkes, New York

Fruit culture in pots is a very interesting occupation and also a very satisfactory way of obtaining fruit where no regular fruit or orchard house is employed. The present is an opportune time for the gardener to prepare for this addition to their houses in winter. In many large places these plants are grown as ornamentals to beautify the dining room and to allow the guests to take off the ripe fruit themselves.

But I am penning this article for an average, or smaller place with limited glass room. The cost is small. The thing to do now is to order some peach and nectarine trees three years old. They can be procured from any first class nursery, a list of which is to be found each month in the CHRONICLE'S advertising columns.

When received, shake a goodly portion of the old soil from the ball and repot into the same size, or not more than an inch shift if possible. The trees usually arrive in nine or ten inch pots. Pots must be clean. Drainage is important. Place a large crock or tile over each hole and fill up with two inches of coal cinders, or mortar rubble if it is to be had. The proper soil is a rough sod, which if efficient in lime must have a good sprinkling thrown in when compost is mixed, one-fourth well rotted manure and a six-inch pot of wood ashes to every barrel load of loam being all that is necessary. Pot with your soil in a medium condition and make the whole firm and finish off level leaving two inches for water.

After potting, place in a cool shed with air all the time. Give a thorough soaking of water at the roots. When frost comes protect the pots with sufficient straw and leaves to protect the pots from cracking. Frost will not hurt the plants, but will do them good and if no cool shed or cellar is to be had they can remain outdoors, the pots requiring a much heavier protection of straw which must not be put on until they are frozen sufficiently to exclude mice, which will do harm to the bark of the trees.

The next step is when to start to force them. To begin with, they should be brought into a cool house of any description, providing it is light and airy. They must, however, now be studied and not sacrificed to grow lilies. etc., but mums that are needed for cuttings, roses in pots needed for Easter and hydranges can be handled together. The temperature must not exceed 34 degs. Fahr. to commence with and if started the latter part of De-

cember, or even in January, they can be kept for two weeks in that temperature. Give a good watering at the roots, also spray every portion with aphine as a preventive of scale and other pests. This is very important only use sufficient heat to keep from freezing. On bright days syringe to enable the buds to lump up and swell. In a few weeks they will burst into bloom and they must receive as much ventilation with discretion as possible; also keep the house a little drier, but on no account allow dryness at the roots, or much will be lost. A higher temperature can be maintained but must not exceed 52 degs. Fahr. at night. A successful setting depends now on careful watering, also fertilizing the flowers which had better be gone over daily with a camels hair brush; but bees are the best fertilizers and should be encouraged by bringing to the house a few pots of freesias, hyacinths or wallflowers in bloom. When a good set has taken place, clean off all dead blooms from the fruit and syringe very gently to enable the growths to develop and the fruit. The house can be syringed at 2 p. m. and closed down, giving a little air on the lee side at 5:30 p. m.; still be careful not to overheat at night.

As the fruit develops rapidly more water can be given and a humid atmosphere kept up to prevent red spider.

It is in the next period that the crop can be secured or lost. Namely, the stoning period. The stone begins to form when fruits are size of an English Walnut and for a short time a check, almost a standstill, is given to the plant, and this is the important time and one that must be religiously observed, namely, the temperature, watering and ventilating must be kept as even as possible.

When stoning is past, all undeveloped fruits can be picked off, also a few that crowd each other. A closer atmosphere with good thorough syringing noon and afternoon can be given. The young shoots which form next year's crop must be selected and others rubbed out with the thumb and finger.

When the growth retained has grown about seven inches the point must be taken out. At this time, with the tree carrying fruit, the leaves will sometimes assume a pale green or sickly appearance. This denotes a lack of iron in the soil, which can be remedied by giving a watering of sulphate of iron once weekly—one ounce to the gallon of water. If surface roots become exposed, give a top dressing of good soil similar to what the plants are in. A sprinkling of bone meal and wood ashes will help to finish the size of the fruit, which treatment must be discontinued directly the fruit shows color. When the fruit is ripe the houses must be kept cooler and drier.

Varieties can be grown together in the same house. A good nurseryman will supply you with suitable kinds for the purpose.

#### THE HERBACEOUS PHLOXES.

(Continued from page 406.)

both of which are objectionable whenever they can well be dispensed with. Hardly any of either one or the other is necessary with the dwarfer kinds when the shoots are not drawn up weakly, but the taller varieties do certainly require some support. This should be given them in good time before the shoots incline outwards from the perpendicular.

These Phloxes are very useful for cutting, looking well when arranged by themselves, two or three colors together. The faint but delightful fragrance of the flowers can hardly be found fault with by the most sensitive in this respect, whilst they last for several days in

good condition. This latter point may be further enhanced by using for the spikes receptacles which hold a good quantity of water, so that the sten's may be a good depth into the same. Small side shoots taken off before all of the spike is in flower do remarkably well for small-sized vases or glasses. A few spikes of any of the ornamental kinds of grasses would associate very well with these Phloxes, but do not attempt to add to the effect by introducing flowers of a quite different character, either in color or formation.

Had I to keep a good supply of flowers in the conservatory during the season these Phloxes are in bloom, I would have several of them in pots well prepared for the purpose. Good plants could thus be had in 9-inch or 10-inch pots that would lend quite a distinct feature, and where they had not previously been grown would constitute a pleasing change to the o umary run of flowering plants then in season. They should be potted on from cuttings the previous year and plunged out-of-doors to the rim of the pot. In this way well-established plants could be had, which, when plunged, give but little trouble in watering. Care must be taken, however, that the plants do not suffer from want of water, more especially when the pots are well filled with roots. After flowering in pots they may either be planted out or shifted on to larger pots for another season.

As the season is now advancing for these Phloxes, note should be taken of the varieties seen in flower. Planting had better be deferred till the spring, when growth is commencing, taking the precaution to well prepare the soil when vacant in the autumn.—Gardening Illustrated (English).

## GLADIOLUS GROWING FOR PLEASURE. By P. W. Popp

The Gladiolus is easily the most popular out-door flower of today, almost every color taste may be gratified. The Gladiolus will thrive and give results with but little care, and again the most remarkable results will forward any extra care or attention that is rendered. A season of bloom from July until cut down by the hard frosts may be enjoyed by successive plantings. Even early in June flowers may be had, where the convenience of a greenhouse or hotbed is at hand. To start the corms that may be planted in the open after danger of frosts is over, a convenient method and one within the reach of all, is to use the ordinary square quart size berry basket, from one to three corms may be planted according to size, barely covering them and having the baskets about level full of earth. Ordinary garden soil with the admixture of a little sifted coal ashes makes a good compost, friable and easily drained, to which the roots will cling when the basket is removed prior to planting out. This is easily accomplished by cutting the corners with pruning shears, and sliding the entire "ball" out, which is then planted without disturbing the roots.

Plants so as to have the top of the corms at least three inches below the surface. A depression may be left about each one, which will catch the rains and also allows the sun's rays to penetrate and warm up the soil. Cultivating will gradually level up the surface these deep planted Gladioli require, but very little support when the plant is large and bearing a heavy flower spike: as a precautionary measure against the blue aphis or other insects that are sometimes found under the outer covering of the corms. I always soak them for a few minutes in a tobacco or nicotine solution "Aphine" or any other good commercial product, using a solution slightly stronger than that recommended for spraying. This also

The ideal fertilizer for any crop is well decomposed stable manure, but this is not always available. A "Complete" manure such as used for potatoes is an excellent substitute. Bone meal or pulverized sheep manure are also good. Alternating these with wood ashes fortnightly, cultivating after each application, and watering thoroughly when necessary. An occasional dressing of air-slaked lime is very beneficial in keeping the soil sweet. After the flowering spike is well defined, a light applica-

acts as a repellant to any insects that might be in the soil.

tion of Scotch soot and worked into the soil is grand medium for intensifying the colors of the flowers, especially the pink shades.

The real beauty of the Gladiolus is only realized in September or later, when the flowers have more substance, the colors brighter, and the spikes finished with a greater number of open flowers at a time. The blue heliotrope and lavender shades are especially fine; in July and August the hot sunshine and the pollenizing effects of insects cause the flowers to "go to sleep" almost as soon

as they open.

For a long season of bloom the following method will be found convenient and practical: About April 1 take out all the Gladioli from the winter quarters and divide each variety in as many parts as it is desired to have plantings. Take paper bags and mark the planting dates on each, in the vicinity of New York City July 1 is about the latest safe planting date, to insure getting all the blooms, and assure ripening of the corms, select all the largest and heaviest corms for the last planting; all bublets and small corms are best planted at the first planting; each set of bags according to planting dates are then placed in boxes, leaving the top of the bags open for circulation of air and prevent heating; these boxes are then placed in a dry, cool cellar until the special dates for various plantings occur. A good vegetable cellar is an ideal place. Of the many methods tried I have found this to be the very best, as I find but little shrinkage in the last lot planted. We plant double or zig-zag rows five inches apart, 24 inches between the rows. This allows convenience in cultivating and gathering the flowers. High cultivation sometimes renders it necessary to afford some support. This we furnish by driving stout Bamboo canes in a single line four feet apart, stretching jute twine, down one side of the row and up the other side turning a loop around each stake, this allows a free circulation of air, and supports the spike as long as neces-

When the Gladioli have all bloomed it is well to give a thorough weeding and cultivating, with an application of lime to the soil to sweeten it and release the latent properties of the fertilizers that have been used. This benefits the corms in the soil and insures good stock for the next year. Digging the corms should be done before the foliage becomes too much ripened. Six inches of the stalk may be left on the corms to advantage. When first dug they should be spread out in a thin layer in a cool, airy place until thoroughly cured. After being well ripened and thoroughly dried the tops may be cut off close to the corm, the last year's corm removed, and then packed in thin layers about two or three deep in shallow boxes and placed in a cool, dry, frost-proof cellar. A thick lining of newspapers in the boxes is a good insurance against extreme drops in the temperature.

## Golden Gate Park, San Francisco

By John, McLaren, California

The Park System of San Francisco comprises thirtythree parks varying in size from two to ten hundred acres.

The largest park in the system, Golden Gate Park, is located on the easterly shore of the Pacific Ocean and has a frontage on the ocean of half a mile. Its entire area has been reclaimed from the shifting sand dune state by planting, until now it ranks in many respects with the best parks in the country.

Where barren sand dunes prevailed a few years ago there is now one thousand acres of planted land covered with a growth of healthy forest trees and flowering shrubs, also lakes, ponds and waterfalls, children's playgrounds, baseball meadows, a stadium (in which is located a trotting track, a five-eighths mile bicycle track, a quarter mile cinder path, and football and cricket fields), miles of drives, walks and bridle roads, tennis courts and conservatories.

The Spreckels Temple of Music is a beautiful structure built of grey sandstone with peristyle effect, forty-five feet in width and seventy-five feet high accommodating one hundred musicians, costing in the neighborhood of \$75,000, and the gift of Claus Spreckels. In front of the temple is a terraced out-of-door auditorium with a seating capacity for twenty thousand persons, shaded with a leafy canopy of elm, linden and sycamore trees. Around the concert grounds is a double carriage drive where autos and carriages parade and their occupants can have pleasant greetings with their friends when they meet or pass each other while listening to the music.

There are also rocky ravines with hundreds of stately tree ferns with stems fifteen or more feet in height and leaves ten feet long and six to eight feet wide, in perfect health and making splendid growth under shade trees on the stems of which the Staghorn ferns are growing vigorously, creating a strange effect new to American parks.

The forests contain fine specimens of native and exotic trees, most of which are peculiar to California and cannot be grown successfully in any other state in the Union.

California is very rich in variety of native trees, especially the conifers, most of which are now represented in the Park System. The coniferous collection includes the Abies Bracteata, the rare Picia Breweriana, the Abies concolor, Abies Magnifica and Nobilis, the Pinus Lambertiana, Pinus insighis, Pinus Torreyana, Cupressus Macrocarpa, Cupressus Lawsoniana, MacNabiana and Goveniana, and, of course, the two Sequoias: Sequoia Sempervirens and Sequoia Gigantea, the Libocedrius decurrens, the Thuva occidentalis and gigantea, etc. There may also be seen many exotic firs, pine and spruce, including the beautiful Abies Morinda from the Himalayans, the cedars of Lebanon, the Mount Atlas cedar and the cedar of India, all doing well and enjoying good health. Native oaks are also well represented, many of the thirty species native to the State becides many eastern and Europeans being fairly represented.

The California population has been recruited from many of the nations of the earth and when emigrating have brought with them or sent back for favorite trees, shrubs and flowers from their former homes. Our friends from the northern States brought their Elms, their Maples and their Oaks; our southern friends sent their Magnolias, their Rhododendrons and their Laurels, etc.; the Italians and Spanish brought the

HUNEINGTON THE GOOD VIGALL PARK

Olive and the Cork Oak; the French their Grape Vine and Horse Chestnuts; the Germans the Copper Beech, Firs and Linden; the English their Oak and Yew, and the Irish, Yew, Silver Holly and Fir; the Scotch their Firs, Brooms and Heather. In fact, all European countries have sent their best and they are all thriving happily.

bined in giving us the Eucalyptus, more than forty

Amongst other plants Australia has sent us numerous fine shrubs, including more than thirty species of Acacia, all gorgeous bloom carriers.

New Zealand sends us over twenty species of Veronica, as well as O'Learias and the Kauri Pine, together with many varieties of handsome tree ferns.

The Japanese brought the Camelia which is growing in large groups, the Retinospora, Theavopses, Laura Camphora, etc.

Chili sent the Aracarias and Escallonias in many varieties and all are doing splendidly

No public park in either Europe or America has or can have the variety of plant life growing out or doors that is found in California. The climatic conditions being so mild and even in temperature plants from cold countries as well as plants indigenous to semitropical regions find favorable conditions in this park. Among flowering plants for example, Fuchsias grow more than fifteen feet in height, Geraniums grow almost as high and they are in flower twelve months in the year. The Violet begins to blossom fit October and continues in flower until April. Cinerarias may be seen in flower out of doors early in March; Cyclamen bloom all Winter and the Coronilla, the Cytissus racemosa and Polygala Dalmaisiana are always flower. mg. The Frica, in twenty species, blocus from No. vember to May

California is the natural home for the plant lover, no matter what his taste may be. He may grow the (Comt | not on for a 422)

Editor, GARDENERS' CHRONICLE:

During the long trip taken by the eastern delegates to the Convention of the American Association of Park Superintendents, stopovers were made in sixteen cities. The park officials of each one of the cities visited were unfailing in their courtesy and their hospitality, and gave us such excellent opportunities for seeing the various park systems, under the very best of guidance. During the hurried trip, so many things were seen, that the impressions which were crowded upon us day after day, will take a long time to sort and classify, but preeminently above them all stands the impression of being welcome wherever we went. As Chairman of the Transportation Committee, I cannot but beg space of you, Mr. Editor to herewith publicly give an expression of thanks, personally, as well as for the entire party, to the officials and others who made the long journey such a splendid success. I feel truly sorry for every member who had to miss the opportunity of taking the trip.

Tery truly yours,

HERMANN W. MERKEL.

#### THE LATE JAMES ALLEN

It is with the deepest regret we have to report the demise of James Allen, who passed away very suddenly on August 17. The news came as a great shock to his many friends. Mr. Allen, who was in his forty-eighth year, was born in Kent, England, coming to this country while a very young man. He was employed several years on commercial places, including that of the late Peter Henderson; later he held several important positions as private gardener. At the time of his death and for fourteen years previous he was head gardener to Mr. A. D. Juilliard, Tuxedo Park, N. Y., where he justly earned the reputation of a capable and ardent horticulturist who was highly respected by his employer and esteemed by his many friends. Besides his wife Mr. Allen left a son and daughter to mourn his loss, and to whom the sympathy of all his friends is extended at this, the hour of their sad bereavement. He was an active member of the Tuxedo Horticultural Society, and at one time was for several years its treasurer. Those who knew him best will miss him most.

#### COMPETITIVE BROTHERHOOD

Would it portend the dawn of the millennium if all the petty jealousy which so often disturbs the peace of competitive horticultural efforts should cease? At this season, when exhibits claim so much attention, we are surely given a splendid opportunity for thought along this line. Is there such a thing as competition? Does the man who gives time and thought merely to compete and win always come out the winner? Competition is not what is needed, if by competition we mean only a grouchy desire to beat the other fellow. Individualism is what will count. Success usually comes to the one who stands on his own feet and figures out some original plan of procedure.

Did you ever stage an exhibit and have the other fellow avoid it as if it were decked with poison ivv? Did you ever put up a new plant or flower which you knew to be a gem and a credit to the profession you had adopted, and then wait patiently for the other grower to tell you how pleased he was that you had succeeded in bringing out something so fine? You probably received your first word of appreciation through the papers, which is cold sympathy compared with a hearty handshake. Since my association in horticultural work, I have often been led to ask those with more experience why there was not a broader-minded feeling for the advancement of all horticultural interests, instead of this all-absorbing interest in personal gain. The answer has been that such philanthropic principles would not increase the bank account. This may be truth, but no man can grow all the bulbs. or supply all the flowers, nor introduce all the new pinks, blues or yellows. Each has some individual aptitude which is bound to work out eventually for the common good. There is in each and every man a vein of goodfellowship, large enough and strong enough to stand the test of the Polly-Anna gladness. Glad that an opportunity was given to win or lose and glad of a chance to come back. Someone will ask, "Come back for what?" If for no better reason, just to help in the everlasting struggle to make this old world a better place to live in.

Henry Worthington gives sound advice when he tells us to rejoice in all the honors which come to those we know. That you know them makes you a partner in their fame; that you rejoice with them brings you their friendship. If exhibits must be competitive, it should be our endeavor to make them the material expression of a competitive brotherhood.-Mrs. B. Hammond Tracy, in Gladiolus Bulletin.

### NATIONAL ASSOCIATION OF GARDENERS

JOHN W. EVERITT, President, Glen Cove, N. Y.

OFFICIAL COMMUNICATIONS

M. C. EBEL, Secretary, Madison, N. J.

#### SUMMER MEETING AT SAN FRANCISCO, CAL.

The Summer Meeting of the National Association of Gardeners was held in the Civic Center Auditorium, San Francisco, Cal., Wednesday, August 18, 1915. In the absence of President John W. Everitt, of New York, Vice-President William S. Rennie, of California, presided. Mr. Rennie welcomed the visiting members to California and expressed his regrets at the inability of the other officers, who had planned to attend the meeting, to be on hand. He presented the following message from President Everitt: "To the Members of the National Association of Gardeners,

"I cannot think of a greater privilege that could come to me than that of presiding at the first meeting of our national association on the Pacific coast, but, though some of us who pursue the calling of gardening are more our own masters than many of those who have left our vocation to engage in commercial fields, we have responsibilities which must receive first consideration if we are faithful to our employers who place their trust in us. So, while I have been looking forward to the opportunity of clasping hands with my brother gardeners on the western shore of our country, the United States of America, circumstances beyond control, that have arisen at the last moment, have made it impossible for me to make the trip. I regretted this the more when I learned that our secretary, who has been faithfully working for nearly a year for a successful summer meeting at San Francisco, was suddenly forced through ill-health to give up his trip.

"Whether we come from the east, the west, the north or the south, as professional gardeners our aim should be to produce a broader development for ornamental horticulture which cannot fail to bring greater recognition to our profession, and which will ultimately result in increasing benefits to those in it.

"Our national organization, the National Association of Gardeners, should be our nucleus for the expansion of our energies and it should have the earnest support of every gardener loyal to his profession. Its scope is national, and through the co-operation of the many local horticultural or gardeners' societies scattered throughout the country, combined with the individual efforts of its members, it should grow and accomplish much in the interest of that for which it is striving; but this can only be accomplished through united co-operation and individual effort.

"We are fortunate in having in California our able Vice-President, William S. Rennie, to officiate, and I have every confidence that the fraternal ties of our profession between the east and the west will become more united as a result of this gathering.

"A strong national association of the gardeners, heartily supported by those who follow the profession, I believe could be made most powerful and influential in its work for the good of the profession, although it may at times prove disappointing to individuals seeking direct benefits from it. It is, as you are aware, the policy of our association to develop along lines where it will serve its members and aid those striving to advance and better themselves in their calling. We have committees at work endeavoring to thrash out the problems with which an organization like ours is confronted in its development stage, and these committees, and also your officers, at all times court and welcome suggestions from members which may be valuable in aiding the progress of the organization.

"In the east and middle west the National Association of Gardeners is already truly representative of the best element of those engaged in professional gardening, and it numbers in its roll of membership, practically all who rank foremost in the profession. Within the past year it has made rapid strides in the far west in enlarging its membership, and I appeal to my brother gardeners of the Pacific coast to continue this good work by enrolling in our association all those properly entitled to the calling of gardener and let us all co-operate to place our association in the front rank of horticultural organizations.

"J. W. Everitt, President."

As the meeting was an informal one, there being no regular business to come before it, a general discussion regarding the gardening profession and the relations of the National Association of Gardeners towards it was entered into, in which many of those present took part. While the meeting was not a largely attended one what there was lacking in numbers, however, was balanced by the general interest and enthusiasm shown by those present.

Robert Williamson, of Greenwich, Conn., being called on to say a few words, during the course of his remarks said. "I am indeed glad to be here to meet with the gardeners of the west. I am somewhat disappointed that there are not more of our eastern members present, as we expected to have a larger body with us, but.

of course, we are rather young as an organization and on account of the distance being so great we must make allowance for so few of us here from a distance, but personally I am glad to have taken the trip to meet with the other gardeners here."

David F. Roy, of Marion, Mass., referring to President Everitt's message, stated, "I can quite understand why it is that he is not here. Men in our position, if they want to succeed, find that one of the first requisites is that they must cater to the wishes of their employers. I have been a gardener for a number of years and have often heard it stated, 'Well, you can only get so far and no further,' but I must say that I cannot always agree with that. My experience is that a man has a great deal to do with what he makes of himself; in other words, the tide will find its level. If it is in the man, he will get there."

L. P. Jensen, of St. Louis, Mo., in urging a campaign to increase the membership, remarked, "I am one of the newer members of the organization. This is the first opportunity I have had to be with this body of gardeners. I hope in the future I will be with you often. I came in as a member early this year. Previous to that time I had heard very little about our organization, and it seems to me that the gardeners throughout the country do not know enough about it. I think we need publicity. I think we ought to make a strong effort to have our members throughout the country get in new members. That is one thing that we should make a point of, and in that way in a short time we would have a strong representative body of men throughout the United States."

W. T. Lee, of San Francisco, Cal., speaking on increased membership remarked, "It seems to me that as we develop and get more members we should have local organizations if it can be done, to affiliate with the central body in some way, so that we could meet once in a while. Take this Coast, for instance, we could have a meeting of our own once in a while to work in conjunction with the central body, but still at the same time, as you men coming from the east will see, we are more or less isolated down here. It is a long way from here to the nearest large centers of population. I believe in that way it would create more interest.

"I understand that there are quite a number of members on the Coast, so brother Rennie tells me. I did not know that there were so many as he says there are."

A. Bischke, of Noroton, Conn., speaking on the pleasures of the trip and the future of the association, said, "I do not know how our other gardeners will feel when they find what we have seen and heard here. I know that they will greatly regret that they were not able to join our party and come here to the west. I must say that I am greatly surprised to see the strides that have been made by these great western cities; for instances, Minneapolis and Seattle. I thought that Seattle was a little bit of a town, perhaps like some of the suburbs of Chicago, but I found Seattle, although a very young city, is not an insignificant town such as I had supposed it was, but is a great big city, and we have nothing in our part of the country that will compare with the parks of Seattle.

"Then take Tacoma, with its giant trees, we have to take our hats off to those trees, lakes and boulevards. We have nothing like them in the east. I know that Messrs, Everitt and Ebel would have liked to have seen these things. There may never again be an opportunity in their lifetime to see what we have seen who are Who would take the bother to show a single man the things that we have been shown on this trip? Every park superintendent has been anxious to show us around and let us see the best that they had. I think we should strive to start a propaganda in each city and in each community to develop our association right now. It should not be a local society. It should be a national organization. The more members we can get in, the better, and scattered all over the United States. If we could get a great volume of men to work hand in hand it would be well. Our profession is a great one. What would a city like Minneapolis or New York, or any of the greater cities, be without their parks, or their gardens and trees? They would be a barren waste. So let every man here work for the betterment of the gardening profession and the development of our national association."

Mr. Jensen, resuming his remarks, referred to the situation as he found it in the city of St. Louis where, he stated, "the gardeners do not seem to pull together." Continuing he said, "We have some very efficient men as gardeners in the parks, in Shaw's garden, and connected with private estates; but they do not seem to come into relationship or contact with one another. It occurred to me a few months ago that some method might be devised to bring these men closer together. Of course, in societies of various kinds it generally falls to the lot of a few men to do really all the work,

so it occurred to me to call a meeting of the Superintendent of Parks of St. Louis, the Manager of Shaw's Botanical Garden, the man who has charge of the landscape work for the schools and a particularly efficient gardener who has charge of the ornamental planting for the parks. I called these men together at my home. and told them that my object was to try and form a little social organization; and on account of the difficulty of anyone entertaining a large gathering at their home. I suggested that we add to our number enough to make twelve members, and hold a meeting occasionally to have no formal organization, no officers of any kind, but that a paper be prepared on horticultural topics, and that after reading the paper we have a discussion on it. We have had two such meetings, and made a good start, and I think we are going to continue it. It seems to me that in some places it might be a good thing to hold such meetings and cultivate good fellowship. These meetings might be held once a month; and if this plan could be adopted quite generally, I think it would create greater efficiency

Vice-President Rennie responded that he quite agreed with Mr. Jensen that it was a good idea to get together once every month or three months, and come to some agreement together. He also favored the suggestion as to appointing vice-presidents in the different states and having branches in each state to stimulate these gatherings as

feeders for the main body.

Percy Ellings, of Menlo Park, Cal., secretary of the Menlo Park Horticultural Society, extended an invitation to the visiting gardeners to come to Menlo Park and he the guests of the society for a day, stating that they had made arrangements to take the gardeners all through the principal estates down on the Peninsula and afterward treat them to a good old-fashioned Spanish barbecue, which would be a novelty to the visiting gardeners.

Owing to some misunderstanding in the itinerary as to the date of departure the invitation could not be definitely acted on, but on motion by Mr. Wirth the invitation was accepted with a vote of

thanks to the Menlo Park Horticultural Society.

Theodore Wirth, of Minneapolis, Minn., being called on for a few remarks, replied, "I simply want to say this, that while I am a park superintendent now, I came to that position as a gardener, and I am proud to be a gardener and always have been proud of it and always will be. There are many possibilities in our profession. so many different ways to develop that it is certainly very important that we make more effort in the future than in the past to get together and enlarge the usefulness of the National Association of Gardeners. The only way that this can be done best in my opinion is through the formation of local organizations and having them represented by delegates sent by these local organizations to the national meetings wherever they may be held.

"You all know that very few of the gardeners are financially situated so that they can travel clear across the continent to attend these meetings. You also know that there are very few employers that realize the value of these meetings. They really do not know, chiefly because they are not informed as to what we are trying to do; consequently, there are very few of them who are willing to pay the expenses of their gardeners to attend here, although they might be willing to do so if they were properly informed of the value to the gardeners and to themselves of these meetings. will come when they will be willing, I believe, to help us along

these lines.

"Mr. Roy said that it depends upon the man himself as to how his profession shall be regarded. I quite agree with him. I think we can improve our situation and our relations as gardeners by showing that we are men as good as our employers. If you can prove that you are worthy of respect, you can receive it, and you will improve your situation and your relation with your employer a great deal."

Vice-President Rennie next called on Richard Vincent, Jr., of White Marsh, Md., referring to him as only a young boy, to which Mr. Vincent replied, "I am seventy-two years young, that's all. Now in regard to this matter before us, I am something like the boy who made his first trip out in the country, and saw a great big something there, he did not know what it was, and he looked around and inspected it on all sides. He said, that is a tarnation funny house, with no chimneys, doors, or windows to it. An old farmer that he met there said, 'That is no house,' 'Well, what is it?' 'A hay-stack.' The boy replied, 'I may be a greenhorn from the city. but you can't fool me that way. Hay don't come in humps like that.

"I may be a little green as to what the idea of this association is, but I think that the suggestion in regard to building up the organization is an excellent one. Every man who wants his organization to go ahead has to put a little energy into it. Now, in regard to the appointment of a number of Vice-Presidents, of course, you can do that, but what is the use of a large number of Vice-Presidents? They are likely to be simply dead timber, and instead of their stirring up membership for the society, nine times out of ten they will want more stirring up than the men that they are supposed to stir up.

"I know what a struggle it is to success. Remember I have a haby of my own to care for, The American Dahlia Society, which

has only been born within the last six or seven weeks, yet we are hustling all over this country for membership, and we are going to have it. We are going to show the world what Dahlias are. You gardeners have to carry your products somewhere to show the people what you have got. You have got to entice the people to go and see them. It is only by thorough work that you can make this organization what it ought to be. It is now in its infancy. but it can and will grow if you will only put your shoulders to the wheel and give it a little push up hill.

"I am sorry Mr. Ebel is not here, because he would give you a much better talk than I would. He wrote me and asked me to come here and just jog you up a little bit if it was in my power

"So I believe if you push this thing, you can not only keep up with it but get ahead of it. It needs push all of the time. if it is ever my privilege, if I live long enough to address this body again, that I will tell you something better than I have this afternoon.

Mr. Vincent was followed by some of the members of the Pacific Coast and their remarks indicated that they were thoroughly interested in the work that could be accomplished by an organization such as the National Association of Gardeners and that they could

be counted on to give their support and co-operation.

An invitation was received at this time from the American Association of Park Superintendents to have the members join the meeting of the park superintendents and to attend the illustrated lecture of Hon, Samuel E, Hill, President of the Pacific Highway Association on "Good Roads." At the suggestion of Vice-President Rennie and Mr. Wirth, the meeting adjourned to attend the lecture. It was intended to re-convene after the lecture, but owing to so many other attractions of the exposition city there was no re-convening and the meeting stood finally adjourned.

#### AMONG THE GARDENERS

The sympathy of the many gardening friends of George  $\Lambda$ . Breed, president of the Lenox Horticultural Society, are extended to him on the recent demise of his wife.

Richard Brett, for many years superintendent of the S. T. Peters Estate, Islip, L. I., has been forced to resign his position owing to ill health. Mr. Brett is now making his home at East Orange, N. J.

David Roy, superintendent of "The Moorings," Marion, Mass., and Mrs. Roy, who traveled with the park superintendents on the trip to San Francisco and return, say that it was a trip never to be forgotten by either of them and that western hospitality cannot be too highly praised.

Robert Williamson, superintendent of "Milbank," Greenwich, Conn., also a member of the park superintendent's party to the Pacific coast, intended to return by way of the Panama Canal. but changed his plans at San Francisco and returned east with Using his own words "they were such good company the party. that I could not part with them."

A, Bischke, superintendent of the Ziegler Estate, traveled with the park superintendents, but left the party at thicago on its return to join Mrs. Bischke and daughter there for a more extended vacation.

Oscar Karlson, superintendent of the Kingsley Estate, Riverdale, N. Y., another of the park superintendents' party reported on his arrival that the horticultural features at the San Diego Exposition must have proven a marvel to all who never before had an opportunity to see California's tropical plants. While the San Francisco Exposition has a fine horticultural display, he. however, stated that it is a more artificial one than the natural plantings to be seen at San Diego.

#### PARK SUPERINTENDENTS' CONVENTION.

The seventeenth Annual convention of the American Asso ciation of Park Superintendents was held in San Francisco. August 18 to 20, with an attendance of one hundred park execu-

tives from the larger stres of the United States and Canada The convention program provided one day of papers and discussions and two days of inspection tours of recreation facilities

of San Francisco, Oakland and Berkeley as well as the landscape teatures of the Panama Pacific Exposition and number of private estates adjacent to San Francisco. Practically the entire convention party toured the entire Pacific Coast, inspecting the recreation features at Spokane, Seattle, Tacoma, Portland, Los Angeles and San Diego, the eastern party, also stopping at Salt Lake City, Pueblo, Colorado Springs, Denver, Kansas City, St. Louis, Minneapolis, and Chicago,

The following officers were elected: President, Emil T. Mische, Portland, Oregon, Vice Presidents, J. W. Thompson, Seattle, John T. Walsh, New York: Alex. Stuart, Ottawa, Canada; E. P. Griffin, East St. Louis, III; E. B. Goebel, Grand Rapids; L. P. Jenson, St. Louis, Secretary-Treasurer, Roland Cotterill, Seattle. New Orleans was selected as the city for the 1916 convention, which will be held in October.

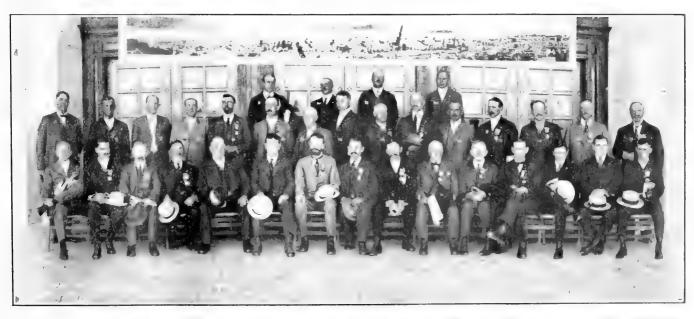

At the opening session, Wm. H. Metson, president of the San Francisco Park Board, delivered an address of welcome and outlined in a very interesting way the progress of park work in San Francisco, lauding the wonderful achievement of Supt. John McLaren in the creation and development of Golden Gate Park. Vice-President, H. W. Merkel, responded on behalf of the As-

sociation and described the trip across the continent by the eastern delegation, each city of the west and of the Pacific Coast being a revelation to the party and San Francisco with its exposition and wonderful Golden Gate Park being the climax.

The annual report of Secretary-Treasurer Roland Cotterill showed that during the year the indebtedness of the Association had been cleaned up, there was a small balance in the treasury and a membership in good standing of 191.

Twenty-four new members were admitted to the Association, a larger number than at any previous session, the applicants being as follows:

Henry W. Busa, Supt. of Parks, Detroit, Mich. Chas, W. Davis, Supt. of Parks, Memphis, Tenn. Wm. R. Reader, Supt. of Parks, Calgary, Can. Frank Shearer, Supt. of Parks, Los Angeles, Cal. J. G. Morley, Supt. of Parks, San Diego, Cal. W. C. Claybaugh, Supt. of Parks, Fresno, Cal. J. M. Paige, Supt. of Parks, Pomona, Cal. David F. Roy, Supt. of Parks, Marion, Mass J. O. Conville, Supt. of Parks, Portland, Ore. W. R. Hancock, Supt. of Parks, Fergus Falls, Minn. Albert Bieschke, Supt. of Parks, Noroton, Conn. John D. McEwen, Supt. of Parks, Queensboro N H. H. Elbers, Director Botanical Gardens, Buffalo, N. A. Jacob Umlauff, Head Florist, Scattle, Wash,

Sitting, Left ( Rig t - 3 D. McEwen, George C. et al. William R. Resland, C. . . Endle, J. W. Trengall, R. W. Gero dl. Herman W. Merrell, Carl Fohn, C. B. W. 3, John McLarer, Trol C. Geron, Mex. Street John I. Will, Walter Wingler.

Standing—E. P. Gruhn, J. M. Paige, John Meisenhacher, W. C. Claybangh, Mex. Fish, J. L. Walterd, Frink Borrolet, John Berry, Eugene Ground, George H. Hill, J. J. M. Sche, George Grote, L. P. Jensen, J. C. Lyle, J. Cahon, D. Larquistasen, Wm. Albert, F. Sherrer, J. G. Morley, J. F. Prost.

H. L. McGillis, Park Engineer, Scattle, Wash. W. R. Pierson, Supt. Cromwell Gardens, Cromwell, Conn. Wm. Allen, Secy. Park Commission, New Orleans, La. E. C. Lyle, Landscape Engineer, Bellingham, Wash. C. De Grelle, Landscape Architect, Montreal, Can. Jas. F. Dawson, Landscape Architect, Brookline, Mass.

Donald McLaren, Landscape Architect, San Francisco, Cal. Daniel Mac Rorie, Landscape Architect, San Francisco, Cal.

Ralph, T. Stevens, Prof. of L. G., Berkeley, Cal. W. T. Rementer, County Forester, Los Angeles, Cal.

During the course of the day and evening the following papers were read and were followed by interesting discussions. papers will be published in the official organ and will also be included in the printed proceedings of the convention.

"Are Charges for Certain Park Services Justified?" by Theo-

dore Wirth, Supt. of Parks, Minneapolis, Minn.

"The Drift of Modern Recreation," by E. B. De Groot, Director of Physical Education, San Francisco, Cal.

"Public Parks as Preservers of Native Plants," by L. P. Jen-

son, Supt. of Busch Gardens, St. Louis.

Stereopticon lectures were delivered by Samuel Hill, President of the Pacific Highway Association, his subject being "Good Roads"; and by J. H. Prost, City Forester of Chicago, on "Civic Beautification.

J. G. Morley, Supt. of Parks of San Diego, presented stereopticon views of the Panama California Exposition at San Diego.

Proposed amendments to the by-laws were given considerable attention, the following being the substance of changes made.

Specific classification of membership and definining qualifica-

tions along new lines.

Senior Membership: Persons of five years' practical experience as park superintendent, assistant, engineer, architect, forester or other executive.

Junior Members: Same as senior members, except having had less than five years' practical experience.

Associate Members: Park Commissioners or secretaries, land-

scape architects, foresters or other persons identified with horticulture or arboriculture.

Sustaining Members: Park Commissions or other governing bodies or individuals who may contribute to the support of the Association at \$10,00 per year, having no vote, but being entitled to the information, service and publications of the Association.

The president and secretary were authorized to enroll sustaining members at any time, all other applications to be submitted at the annual convention.

Power to set the date for holding the annual convention was

vested in the Executive committee.

Senior members, only, to be eligible to hold office, but junior members and associate members may serve on committees, vote on all matters and participate in conventions.

Provision made permitting nominations for office on the floor of the convention in addition to names submitted by nominating

Provision for suspension or expulsion of members for unprofessional conduct or conduct unbecoming a member.

Fixing admission fee for new members at \$10.00 which shall

also cover first year's dues.

Invitations for the 1916 convention were received from the following cities: Cincinnati, Columbus, Buffalo, Boston, St. Louis. Memphis and New Orleans, the last three named being accompanied by urgent invitations from the park authorities holding membership in the Association.

The Executive committee recommended the selection of New Orleans and it was so voted, the understanding being that the convention will be held during the last week of September or the first

week of October.

The election of officers resulted as follows: President, Emil T. Mische, of Portland, Ore., and Chas. G. Carpenter, of Milwaukee, were nominated, Mr. Mische being elected. John McLaren of San Francisco, was unanimously elected as Honorary President.

For Secretary-Treasurer, Roland Cotterill of Seattle was re-

elected by unanimous vote. Candidates for Vice-President were:

J. W. Thompson of Seattle; John F. Walsh, of New York; Alexander Stuart, of Ottawa; E. P. Griffin, of East St. Louis; L. P. Jensen, of St. Louis; Eugene V. Goebel, of Grand Rapids; D. H. Ellis, of Saginaw; C. L. Brock, of Houston; C. A. Bossen. of Minneapolis, G. W. Hess, of Washington; J. Meisenbacher, of Tulsa, and C. W. Davis, of Memphis. Messrs. Thompson, Walsh, Stuart, Griffin, Jensen and Goebel were elected.

The two days of sight-seeing and inspection tours were spent

most profitably.

On Thursday, August 19, the party crossed San Francisco Bay and became the guests of the Board of Park Directors of Oakland, luncheon being served at Mosswood Park, followed by an auto tour of Oakland and Berkeley.

On Friday, the 20th, an all-day auto tour was made of San

Francisco Peninsula, luncheon being served at Spring Valley. Practically the entire party remained in San Francisco until Tuesday, the 24th, visiting the Panama Pacific Exposition, then proceeding south to Los Angeles and San Diego, where a special program of entertainment was provided by the local park authorities.

#### CONVENTION TRIP OF PARK SUPERINTENDENTS.

The convention trip of the American Association of Park Super-intendents, which began at New York on August 7, was one of the most successful and enjoyable long distant trips ever undertaken by any member of the party, and some of them have traveled much. The party which returned to New York on September 6 was loud in its praises of the genuine hospitality which greeted it at every stopping point. Where special entertainment had been previously arranged the local committees had many sur-prises to offer to the visiting park superintendents and their friends; and at stopping points where it was believed nothing had been planned, delegations were on hand to meet the visitors to show them the sights of their cities. It was a trip long to be remembered by those who undertook it.

A. T. De La Mare, managing editor of the Florists' Exchange, who joined the party at Portland, has reviewed the trip as one of the most remarkable ever undertaken by any horticultural body, and that seldom, if ever, has so much ground been covered by any association in a practical way as in this trip, where full opportunity was extended by every city visited to note the provision made by it for public welfare and education through the medium of parks and playgrounds; and that the courtesies bestowed upon the visitors was spontaneous and extreme. There were no exceptions. He estimates that in the trip to the Pacific Coast and return the Eastern delegates covered nearly ten thousand miles in railroad travel, and were carried one thousand miles

The adventures of the trip from day to day are best described in the following excerpts from the diary of one of the ladies of the

party, Mrs. John D. McEwen:

in automobiles on park inspections.

SATULDAY, August 7. On Saturday morning seventeen of our party were nicely ensconced on the Chicago Limited that left the Pennsylvania station, New York, at 11.08 a. m. It took but a short time to become acquainted with Mr. Herman Merkel, first vice-president of the association, Miss Una E. Keith, of Bridgeport, Conn., the only honorary member in the party, her father having been one of the charter members of the association and the rest of the party, consisting of John D. McEwan and wife, Queens, N. Y.; David F. Roy and wife, Marion, Mass.; A. Bieschke and wife, Noroton, Conn.; William H. Coldwell, Newburgh, N. Y.; John F. Walsh, New York, N. Y.; Fred Green, Providence, R. L.; Oscar Karlson, Riverdale, N. Y.; Wallace R. Pierson, Cromwell, Conn.: Robert Williamson, Greenwich, Conn.: Charles Haible, Newburgh, N. Y.; E. W. Schoneberger, Madison, N. J.; Oscar Boehler, Hoboken, N. J. Charles B. Forbes, New Bedford, Mass. The first day of our trip was a delightful one and the Pennsylvania scenery was found to be at its best. Northing occurred the first day of event to record.

SUNDAY, August S. We arrived at Chicago at nine a. m. The day was a most beautiful one and we were met on the arrival of the train by a big delegation well provided with automobiles and toured the city and parks until noon when we were entertained at the Lincoln Park restaurant at luncheon. Each auto was provided with a blue pennant bearing the words "Park Superintendents," and the procession was escorted by four motorcycle police-

We soon found that the entertainment committee, consisting of the following park department officials of Chicago: Frank Foster, chairman; Edwin L. Kanst, J. H. Prost, Albert Mohr and Harry S. Richards, had planned an interesting program for our visit

to their city.

After luncheon we were taken on an inspection trip of the parks. We first visited Grant Park on the lake front; then to the Municipal Pier, which cost over four million dollars; thence to the Clarendon Bathing Beach, the largest in the west. Continuing our drive over the boulevards we next visited the West Park System: Humboldt Park with its beautiful perennial and rose gardens; Garfield Park with its greenhouses, conservatory and mall; Douglas Park with its formal garden; then to the South Parks which comprise McKinley, Gage and Sherman Parks, also the playgrounds and swimming pools. Next in line came Washington Park with its long meadow and conservatory, and then over the Midway to Jackson Park. This completed a sixty-mile tour over the wonderful park system of the City of Chicago.

At 6.50 p. m. we left Chicago over the Chicago, Milwaukee and St. Paul for Minneapolis and were joined on the train by Harry W. Busch, wife and daughter, Detroit, Mich.; Alexander Stuart and Miss May Stuart, Ottawa, Canada: J. H. Prost and Walter

Wright, Chicago.

Monday, August 9.- We arrived on time at Minneapolis where amother ideal day greeted us. We were conveyed from the train to the Elks' Club House in autos, which awaited us, where we were received in the reception room and then escorted to the breakfast room where a bounteous breakfast awaited us, the mayor of the city gracing the head of the table.

We were informed that the entertainment committee consisting of Commissioner Joseph Allen, W. H. Bovey, W. F. Decker, Harry B. Cramer and E. J. Phelps had planned an active day for us Again entering the autos and after a tour of the city, headed by four motorcycle policemen, we proceeded to the parks and there witnessed the workings of the mammoth dredges on the lakes. Our next point of interest was the swimming pool where we witnessed an exhibition of life saving and restoration by the lung pulmotor. Opportunity was given to the members of the party who desired to do so to take a dip in beautiful Lake Calhoun, after which we motored to the other side of the lake to the Minikahda Club House. where luncheon was served. After several impromptu speeches by members of the party we boarded the naphtha launches, which awaited us, for a ride on the lakes. The beauties of the Minneapolis Park lakes will never be forgotten by any of us.

On the opposite shore autos met us and we motored past the beautiful homes of Minneapolis until we reached Minnehaha Falls. The view of these falls and the surrounding park defies description. Minnehaha, or Laughing Water, is symbolical of the falls. One must pass over the artistic stone bridge and in and out the many little walks of the glen to fully appreciate this spot.

The Refectory was our next stop, where we were entertained at dinner. The menu was an excellent one and the hospitality shown us by some of the prominent citizens who joined us here was most genuine. We were welcomed by P. C. Deming, President of the Minneapolis Park Board, and also addressed by Thomas Voegeli, Ex-President of the Board; C. M. Loring (father of the Minneapolis park system), and Theodore Wirth, Superintendent of Parks. Herman W. Merkel and Wallace R. Pierson responded for the visitors.

At the conclusion of the speech making we were taken by the autos to Harriet Park where a special program had been provided in honor of the visit of the American Association of Park Superintendents and the National Association of Gardeners by the Minneapolis Municipal Bank. The numbers of the program included:

..... William S. Manning

Gustave X. Amruha . . . . John W. Ereritt

Entr'acte, "Rose Housse"..... Two Dances, In the Precise Style, sharply punctuated

Boston Patrol, "We Won't Go Home Till Morning", James B. Shea

From Harriet Park we returned to the city, stopping at the Kaiser Hof where we included in more refreshments and speeches, concluding with "Auld Lang Syne," Escorted to the depot by the commissioners and their wives amid a rousing cheer by our party for Minneapolis and its hospitable citizens our train bulled out at 11 p. m.

At Minneapolis we were joined by Theodore Wirth and wife and Frank Staley of that city; Emmet P. Griffen, East St. Louis, Ill.: L. P. Jensen, St. Louis, Mo.; Conrad B. Wolf, Hibbing, Minn.; George Champion, Winnipeg, Canada, and John Meisenbacher, Tuka, Okla.

Tuesday, August 10 - This was a day for rest, our previous day having been a most strennous one. We were now traveling on the Great Northern and our entire day was almost taken up in passing through North Dakota. Late in the afternoon we reached Williston where we stopped for four hours, due to a train wreck ahead, and had an opportunity to visit the town which appeared to be a prosperous one. Leaving Williston that evening we proceeded only about twenty miles when we were held up all night at a little town called Snowden. We departed from here at 11:30 a. m. on Wednesday.

Wednesday, August 11. We viewed the wreck as we passed and it was an awful sight eighteen cars all badly twisted out of shape. God was with us as we were behind the wrecked train which might have been our fate. We were delayed nineteen hours in all, but every one took it good naturedly as we were a goodnatured party.

North Dakota is a "dry" State, and when we crossed the border into Montana there was a stampede for the diner-Oh! just for a lemon soda!

For several hours our path lay through the Indian Reservation and wagons with many Indians and plenty of dogs were seen on the trail. A short stop at Wolf Point was made where we were greeted by a large number of Indians at the station. Next we approached an Indian village and there were many houses but the country is as desolate to look at as North Dakota. Funny little dugouts in low hills with sod and straw roofs and small shacks with single door and window were seen here and there. Miles and miles or flat, dry looking land were traversed with scarcely a tree visible.

At six o'clock we struck the bad lands of Montana and viewed the Milk River Irrigation Project conducted by the United States Government. Stopped at Hinsdale and Saco, Montana.

Miss Stuart and Mr. Ewen arranged a concert for the evening. with the observation car for an auditorium where a splendid program was rendered.

Thersbyy, August 12 We arrived at Glacier National Park at 8 a. m. Had breakfast at the hotel a most wonderful structure imaginable, made of immense trees (unpecled, Douglas Fir). The decorations were hangings of animal skins and mounted elks heads. The waitresses were attired as Swiss peasants, while entertainment was furnished by a stringed orchestra and several Indians with their weird music. Extensive verandas, immense sun parlors, writing rooms, shower baths and every other possible convenience to satisfy the most fastidious taste were found here.

On leaving the hotel for the thirty-two mile auto trip through Blackfoot Reservation, via St. Mary's trail, old Chief Three Bears shook hands and wished us Godspeed in true Indian fashion. Glacier National Park was at one time included in the Blackfoot Reservation in western Montana and is a part of the Rocky Mountain Range. It is sixty miles in length, with an altitude of four thousand five hundred feet in the valley and ten thousand four hundred and thirty-eight feet on the mountain top. The highest point reached on the trail was six thousand two hundred and fifty feet.

A beautiful day and clear atmosphere made all the mountains visible, Mt. Bison, Red Mountain, White Peak with its snow cap extending quarter way down its side, Divide Mountain, Calf Mountain, Twin Buttes, Mt. James and Mt. Pioneer, the great amphitheater, and Red Eagle created in the mind of the observer a feeling of awe inspired admiration. Two Medicine River and lake, Cutbank River, Cripple and Triple Divides were passed in turn and Milk River with its tumbling, roaring currents leaping down the mountain side. The drive in many places skirts the precipice with a sheer fall of hundreds of feet and is only wide enough for one auto. For a distance of eight miles the trail leads through a deep and dense forest of pine trees, the tops of which seem to almost penetrate the heavens. On each side of the roadway for miles there are to be seen a remarkable variety of wild flowers. Blue Bells, Lupines, Hardy Asters, Wild Geraniums, Potentillas and many others in a most glorious array of color and wonderful

Two hours auto ride brought us up to the Chalet St. Mary where we boarded the steamer St. Mary for a ten-mile sail up the lake to Camp "Going-to-the-Sun," where luncheon was served. The waters of the lake are a most beautiful turquoise blue, and great numbers of Mackinaw trout ten and twelve inches long were seen swimming at a depth of twenty feet. The lake is four hundred feet deep in places and at an altitude of 4,500 feet. During the trip two bands of Indians were passed along the shore with wagons and pack horses, and squaws and papooses on horse back. At another place was seen a mountain guide with his boy winding up the mountain trail to some distant camp. Clouds had partly covered the sun, casting shadows on the mountains, causing the waters of the lake to take on innumerable shades. At two o'clock the steamer started back for the St. Mary Chalet.

As the autos were being loaded for the return trip down the trail, the brake on the leading auto had not been properly set and as the last person was seated (the chauffeur was turning in his tickets to the starter), a scream was heard and shouts from the men calling attention to the fact that the brake had been released and the auto was plunging down a thirty-degree incline on the lakeside where the precipice dropped a distance of fifty feet. A sigh of relief went up when it was seen that the chauffeur had reached the wheel.

Arriving back at the hotel the party separated the men to the natatorium and the women to the rest rooms. We had dinner at six o'clock, after which we were entertained by the Indians and their squaws while the stringed orchestra rendered delightful selections of classic and popular music.

At 8:15 we boarded our special cars to continue our journey through the Rockies.

(To be continued in our next issue).

Wallace R. Pierson, who traveled with the members of the American Association of Park Superintendents as far as San Francisco, and on his arrival at that city had to enter the hospital to undergo an operation for appendicitis, has, we are glad to report, fully recovered. Mr. Pierson while convalescing at the hospital wrote to an eastern friend that he was having the time of his life and never enjoyed himself more, all due to the warm friendship and hospitality of California's horticulturists.

## Recreation Work Problems of Park Boards\*

By Theodore Wirth, Minnesota

The recreation work which park administrations of today are conducting, has brought with it a number of problems, which, for many, and probably all of us, are difficult to solve. To bring about the acquisition of lands for desirable park play grounds and their improvement and equipment, seems comparatively easy compared with the question of securing the necessary means for their proper and efficient maintenance, in order to meet the constantly stimulated and ever increasing demand for all kinds of service.

To make our park possessions the recreation grounds of our people, in the fullest sense of the word, is the aim of all progressive park administrations of today. The public deriving the benefit from parks and play grounds, generally speaking, is willing to pay for the cost of the acquisition, improvement and maintenance.

Recreation, if I understand the meaning of the word, means many things. It means the refreshment of strength and spirit after toil in the pursuit of our daily vocations. It means diversion, amusement and exercise of one kind or another. It means rest, relief, relaxation, regeneration. Recreation to some of us is one thing; to others it is something else; and we park builders and supervisors have it within our power to provide it all. It is our duty to see that we do not willingly, or even unknowingly, discriminate in favor of one to the detriment of the other.

We all know that the playground movement, as most of us call it, has made tremendous progress in the last ten years; and I have often felt of late, that, in our aim and zeal to satisfy the demands of the people, and our own ambition to lead, we are possibly over-reaching in some instances the real needs in that direction, and may be using for these purposes an unfair proportion of the limited means at our disposal to the neglect of other things perhaps fully as important. We are apt to overdo some special features and lose sight of others equally deserving of merit. Let us not forget that exercise and play are only a part of the recreation programme, which the laws of nature have mapped out for us to follow.

I am, and always have been, a strong advocate of making public parks the free recreation grounds of the people with as few restrictions as possible. I mean all the people. Parks are for rest as well as exercise. By all means let us provide for our children to the fullest extent within reason, but in doing so, we must not overlook the needs and rights of the fathers and mothers and other grown-ups who are still among us, and whose recreation calls for rest rather than exercise.

On account of insufficient funds, it is impossible for most of our park administrations to meet all the demands of the public for the numerous recreation activities. There is almost no limit to the service that could be rendered if the necessary means were always available. Admitting that all service demanded is at least desirable, let us ask ourselves the question—Is it feasible and justifiable that the cost of all such service be covered by a general tax. Undoubtedly there is a diversity of opinion on this question amongst us, and to bring the subject up for discussion, I express my opinion that to tax the entire cost of all service rendered against the general taxpayer is as unfair as it is unnecessary. I present three main reasons for this contention.

First-A large percentage of the taxpayers cannot

of the facilities offered and provided, and consequently do not derive the full benefit to which they are entitled. Second—I believe it to be an unwise policy to foster

and do not, for one reason or another, make use of all

Second—I believe it to be an unwise policy to foster to the extreme the idea of the free use of all facilities that may be offered. To give everything free will result to a great degree in the careless and reckless use of such privileges and will lessen the appreciation and value of the service rendered.

Third—The users of certain facilities can well afford to pay a small fee, and so help to maintain the service from which they receive special benefits.

I believe it is possible to draw a line between what we may call general service and special service in our recreation work.

Under general service, I class all constructive work necessary to provide the facilities, namely, the acquisition of grounds; their improvement and equipment, so they may answer the purpose for which they have been acquired.

This general service must also include the regular maintenance work necessary to keep such grounds in serviceable condition.

We have, therefore, under this form of service, provided for all such things as lawns, plantings, flower beds, roadways, walks, bridges, benches, tables, lights, drinking fountains, shelters, buildings of all kinds, play grounds, and their apparatus, etc., and we maintain them in serviceable condition.

Under special service, I place certain accommodations and facilities, which I believe should not be furnished gratis, and for which a nominal charge should be made. They are as fallows:

Bathing Service—The use of the bath-house accommodations should be free, but a nominal charge should be made for the use of bathing suits, caps, towels, and such incidentals supplied by the department. Those who bring their own suits and towels have, therefore, absolute free service.

Boating Service—The lakes and rivers under the jurisdiction of Park authorities are, of course, the same as a highway. Any one can put his boat on the water and use the same in compliance with existing rules. Charges, however, should be made for the season for the use of platforms, racks, and lockers built for the landing and storage of private boats and other equipment, and for their special police protection. Boats and launches let out by the department, should, of course, be rented at a nominal price per hour, or trip.

Tennis Court Service—Where there are a number of courts together, I believe it would be well to furnish the nets and charge a nominal fee for the use of same per hour. This would not only help to maintain the courts, but would also facilitate the enforcement of the rules and protect the rights of all comers to get the use of them.

Skating and Toboggan Service—The renting out of skates and toboggans to the public is an accommodation well worth a nominal fee from those who use them.

Locker Accommodations at Golf Links, Gymnasiums, etc., by the Season—An appropriate charge for such accommodations, which are similar to those rendered at a private club, is, I believe, entirely justifiable. It is a question, however, in my mind, whether

Paper read before American Association of Park Superintendents' con vention, San Francisco, Cal.

## Our Native Birds' Protectorate

Under the Direction of the Committees on Bird Preservation and Propagation.
National Association of Gardeners, L. H. Jensen, St. Louis, Mo., Chairman.
American Association of Park Superintendents, Hermann Merkel, New York, Chairman.

#### COMMITTEE MEETING AT SAN FRANCISCO.

At a joint meeting of the committees of Bird Preservation and Propagation of the National Association of Gardeners and the American Association of Park Superintendents, held in San Francisco on August 19, 1915, it was decided to help in the preservation and propagation of insectivorous and other desirable birds in private and public parks, and with this end in view, to, first: encourage the erection of nesting boxes, feeding and bathing appliances; second: the planting of berry bearing trees and shrubs, useful as bird food; third: the co-operation with Audubon Societies and others working towards the preservation and propagation of useful birds, and recommend that park boards and others join the National Association of Audubon Societies. We recommend that the work of this kind in public parks be carried out under the supervision of the park boards of the various cities and towns, and that superintendents be called upon to bring this matter to the attention of their respective L. P. Jensen, Chairman, boards.

National Association of Gardeners.
H. W. MERKEL, Chairman,
American Association of Park Superintendents.

#### HOW TO PROTECT OUR BIRDS.

By Hermann Merkel, New York.

When asked what methods should be pursued for the protection and encouragement of the birds in public parks, my answer has always been:

First.—Kill the cats. Every cat is a potential enemy to bird life. Even the most pampered pet of some household will hunt birds when it has a chance, and while the application of a gaudy ribbon and a bell will prevent the cats from preying upon adult birds, young fledglings and nestlings are still at their mercy. The best method for eradicating cats in public or private parks is to supply some good shot among the employees with a .22 rifle, a Maxim silencer, and plenty of ammunition. Let him prowl around early in the morning and evening, and if his heart is in his work, there will be a great deal less music on the back fences in the neighborhood of that particular park in a surprisingly short time. Often cats become so wary that they cannot be reached with a .22 calibre rifle, and since it is not safe to use a high power rifle, in most of these parks, traps must be resorted to. A box trap baited with fish will usually do the business.

Second.—Supply nesting sites by means of bird houses, and by leaving a few partially dead trees in the wilder portions of the park.

Third.—Feed the birds! Under the conditions usually found in city parks there will be times when insectivorous as well as seed eating birds will suffer for food, and migrate unless artificially supplied. Enough has been written by Audubon societies, and the Biological Survey, and others, about nesting and bird feeding places, to make it unnecessary for me to go into the subject thoroughly, but I may state that for winter feeding we use a simple wire basket into which suet is dropped, and a small platform

upon which is placed a fuxture of wild seeds which we are able to purchase very cheaply.

Protection Against Gunners.—In or near every large city, there are settlements which contain bird hunters (we have found the Italians to be the worst offenders). To these people all birds are food. We have caught them with such birds as the yellow-billed cuckoo, blue-jay, catbird, robin, warblers and finches. These hunters must be prosecuted to the fullest extent of the law, and if the magistrates will not punish them, they must be made to do so, by enlisting public opinion. A few convictions under the Federal Song Bird Law, which provides a fine of \$25 for each bird found, will soon get noised about, and will stop the hunting, and just a few determined men can bring this about.

There are a number of ways by which sentiment in favor of bird protection may be created and fostered Among those tried and found good, may be mentioned lectures on birds in the schools and elsewhere, descriptive and news articles in the daily papers, competitive bird house building by school children, the winner to be given small prizes, etc., etc.

Let each superintendent of a private or public park communicate with the nearest Audubon society and promise his co-operation. Get his school board to encourage nature studies, and help teachers and others with information and specimens, such as old bird nests, etc. Let each of us follow the above directions, and such others as more able advisors can give us, and we will give a new impetus to this good work, and be amply rewarded by the birds themselves, in song, and in tree protection against insects.

#### THE BIRDS IN COURT.

Every lover of birds awaits with great interest the appearance of their representatives before the U. S. Supreme Court next October. Our readers will remember the universal rejoicing that followed the passage of the migratory bird law two years ago. By this act of Federal legislation our migratory birds passed under the protection of the national government. The claim was made, and justly, it seems to us, that migratory birds belong to no single State, and can not be destroyed by hunters even if an individual State so wills it.

A hunter in Arkansas defied the Federal law, and the courts of Arkansas sustained his contention on the ground that the law was unconstitutional. An appeal has been taken to the Supreme Court at Washington. The case will be heard in October, when the Attorney General of the United States will appear for the birds.

We are informed that up to the present the law has been very generally observed; that in many sections it has stopped certain kinds of shooting altogether. Its opponents are those hunters whose desire for "sport," or whose profits from their trade, have been interfered with. It is certain that during this present year many of us have observed a large increase in the number of several varieties of migratory birds. May a gracious Providence incline the minds of the nation's most distinguished judges to give the birds every possible chance as against the hunters! Our Dumb Animals.

#### PREPARING FOR 1916 SPRING SHOWS.

Philadelphia is preparing for its National Flower Show, which is to be held in that city March 25 to April 2, next. The Flower Show Publicity Committee, which consists of some of Philadelphia's leading florists and a number of editors of the local newspapers, is actively en-

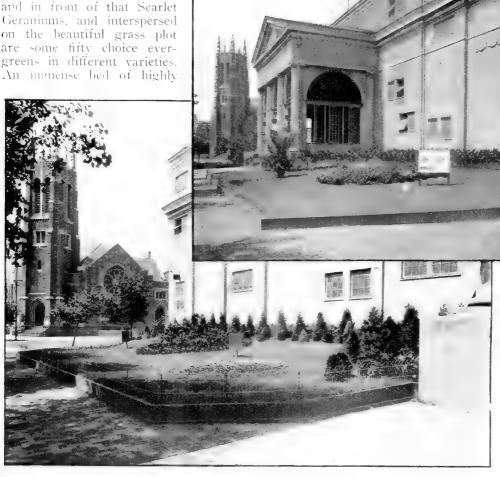

the grounds in front of Convention Hall, where the show will be held, which is already attracting considerable public attention. The Dreer garden and lawn in front of the hall are planted next to the building, with a large irregular border, the rear being planted with Canna Louis Reverchon, and in front with Canna Gustay Gumpper, the entire bed being bordered with Pennisetum Ryeppelianum. Two large oval beds contain Dreer's Single Fringed Petunias.

gaged in exploiting the show. Two of the leading seed firms of the city have planted

Michell's planting consists of the Canna Richard Wallace, distributed along the wall of the building. In front is a planting of Scarlet Sage and in front of that Scarlet Geraniums, and interspersed on the beautiful grass plot are some fifty choice evergreens in different varieties.

will be issued in a few days and which will contain some classes in the nature of novelty displays never before attempted at a flower show in this country, and which should arouse great public interest towards the show when its doors are opened. Considerable trade space has already been disposed of, and the general interest that is manifested in the annual New York Show indicates that it has become a fixed event.

Boston will hold its annual Spring Flower Show during the month of May next year, so that it will not conflict with the large shows in the other cities. Its preliminary schedule has been issued and some tempting premiums are being offered in it for display classes. By setting its date back so that it will not occur at the same time as the Philadelphia and New York, the Massachusetts Horticultural Society should secure outside interest

HALL WHERE PHILADELPHIA NATIONAL FLOWER SHOW WILL BE HELD IN 1915 Showing the planting plot of H. A. Door, Inc., in upper picture, Henry F. Michell & Co.'s in Lover picture

colored Crotons of choicest varieties, pyramidal in effect, covers the centre of the plot. Around the outside of the Crotons are planted Achyranthes Brilliantissima.

New York will hold its annual Spring Flower Show, following immediately after the National Flower Show in Philadelphia. It will be held under the auspices of the Horticultural Society of New York and the New York Florists' Club. The Exhibition Committee is busily engaged in preparing the preliminary schedule, which

in its show, which it may otherwise not obtain.

#### THE CLEVELAND FALL FLOWER SHOW.

The announcement from the Cleveland Flower Show Committee states that they will have important meetings to be held in connection with their show, and they list them as follows:

The annual meeting and fall exhibition of Chrysanthemum Society of America.

The fall exhibition and fall meeting of American Rose Society.

The executive committee

meeting of American Carnation Society

An adjourned meeting of the Florists' Telegraph Delivery Association. Also an adjourned meeting of the Ohio Gladiolus So-

Indications from every large center are that a large number are planning to be in the Sixth City for this big show.

The florists who have traveled, and traveling representatives of leading commercial houses have reported

that the Cleveland Flower Show is being talked of everywhere by every one.

This no doubt is due to the fact that the "live publicity committee" in charge of the Cleveland Flower Show, has been on "the job" continuously, early and late, using novel methods to bring their show before the attention of those who will be interested, and who in turn will interest others.

The final premium list will be ready for mailing about September 10. A number of new classes have been added, including additional prizes, making it especially interesting to both private and commercial growers.

We understand plans are being formulated to organize special train parties, to start from New York, also Boston and Philadelphia, as well as cities in the West.

The full details pertaining to these "personally conducted parties" will be published in the October issue of THE GARDENERS' CHRONICLE.

The one hundred and thirty-five prominent ladies who compose the membership of the Cleveland Garden Club, are represented on the flower show committee by three enthusiastic members, Mrs. L. Dean Holden, Mrs. A. S. Ingalls, and Mrs. John E. Newell. These ladies are planning to develop the Cleveland show into as important a social event for northern Ohio, as the "horse shows" used to be when held ten to fifteen years ago.

An invitation is extended by the Cleveland Garden Club to the members of all garden clubs to attend the flower show.

The final premium list will be mailed, upon request, by addressing Mr. F. A. Friedley, secretary, 356 Leader building, Cleveland, Ohio.

#### THE NEWPORT SUMMER SHOW.

The Flower Show at Newport, R. I., August 12-14, held under the auspices of the Newport Garden Club and the Newport Horticultural Society, showed such a marked advance upon the show of last year that its promoters should feel highly encouraged. The desirability of holding an open-air summer show at some central or easily accessible place is manifest, and it would seem that Newport, with its many gardens planned and planted for the summer season, is the best place to hold such a show. It has the opportunity, the facility and the material, and if the owners of gardens and the gardeners outside of, but not far removed from Newport, can only be interested and induced to support the summer show idea there is no question the show could in scope and perfection be brought to compare with some of the great summer shows in Europe which we talk about but make little effort to emulate.

The private exhibits at the recent show were almost entirely from Newport gardens, with a few exceptions only, as for example, the Campanula pyramidalis from Mrs. Nathaniel Thayer, of Lancaster, Mass., and the fruit from F. E. Lewis, of Ridgefield, Conn. Even Newport is not yet a unit in helping along the summer show. It is hoped, and most certainly to be desired, after the recent demonstration of what can be done with a few owners supporting and gardeners exhibiting, that Newport will do all that it is capable of doing, and then with outside competition a show would result of such magnitude as we have never yet seen in this country.

A few outstanding features of the show among the private growers were the group of flowering and foliage plants arranged by James Bond, gardener to Mr. H. Mortimer Brooks, and which was awarded, in addition to first prize in its class, a silver cup, as the best exhibit in the show from a private gardener. Moreover, it was not the variety of the material that made its strong appeal in this group, but the combination and graceful arrangements of a few things in which the dominant note was yellow Calceolaria and blue Trachelium. In a display of stove plants, Mr. Bond again put up an admirable winning group in which Pancratium fragrans and Streptocarpus were the special features. In Crotons, too, where Mr. Bond was again first, one could but note how skillful arrangement must have been a strong determining factor in the final judgment.

From the Vincent Astor estate, where Mr. James Boyd is gardener, plants in variety showing high cultural skill were exhibited, but conventional methods of arrangements disguised rather than displayed the quality of these exhibits. Cattleya gigas shown by William McGillivray, gardener to Mrs. Stuart Duncan, were exceptionally good, and the group of Gesneras from James Watt, gardener to Mrs. W. G. Weld, was an uncommon and attractive feature.

The winning display of Gladiolus from B. Hammond Tracy, of Wenham, Mass., was a magnificent representation of this flower.

Among trade exhibits the special feature was a bed of coniferous evergreens covering two hundred square feet. There were four entries, these effectively massed along the side and in front of the main tent. Oscar Schulton, of Newport, won the coveted award, and to this group was also awarded a silver cup for the best trade exhibit in the show.

For the success of the show credit belongs to Arthur Herrington, who proved an able manager, and his committee of active workers: Wm. Gray, James Bond, Wm. McKay, John Urquhart and Andrew Dorward.

#### NEWPORT GARDEN CLUB AWARDS.

Best 12 specimen plants of Geraniums James Boyd, gardener to Vincent Astor, first; Daniel Hay, gardener to Mrs. French Vander H. Second. Best her

bed of Geraniums in space of 50 square teet Daniel Hay,

Best bed of Geraniums in space of 50 square teet Daniel Hay, hrst; James Boyd, second.

Best two tubs of Hydrangeas—Newport Nursery, first; Dennis Foley, gardener to Mrs. James N. Haggin, second; William McGillioray, gardener to Mrs. Stuart Duncan, third.

Best display of stove plants, both flowering and foliage James Bond, gardener to Mrs. H. Mortimer Brooks, first.

Lest six vases of outdoor flowers tastefully arranged for adornment of drawing room—William Allan, gardener to Mrs. George D. Widener, first; William MacKay, gardener to H. A. C. Taylor, second.

Best bed of Conifera on a space of 200 square feet; arrangement to count 50 per cent.—Oscar Schultz, first

Best bed of Tuberrous Begonias in a bed of 50 square feet. James Watt, gardener to Mrs. W. G. Weld, first.

Best 6 pots of Campanula Pyramidalis—James Campbell, gardener to Mrs. Nathaniel Thayer, South Lancaster, Mass first; James Bond, second.

Best 6 pots of Campanula Pyranidalis James Campbell, gardener to Mrs. Nathani-I Thaver, South Lancaster, Mass first; James Bond, second.

Best 12 plants of Gloxinias; ferns may be used in arranging -William Allan, first; James Watt, second.

Best bed of Crotons in a space of 100 square teet Jam's Bond, inst; James Boyd, second

Best 3 vases Gladiolus, 3 varieties, 12 spikes each John Mahan, gardener to Mrs. Hugh D. Anchineloss, first.

Bost vase white—Daniel Hay, first; Arthur E. Griffin, gardener to Galen Stone, Marion, Mass, second.

Best vase real William Allan, first; Arthur E. Griffin, second, Best vase pink William Allan, first; Arthur E. Griffin, second, ardener to Mrs. Thomas J. Emery, first; John B. Urquhart, gardener to Governor R. L. Beckman, second.

Best bed or collection of yellow flowers, not less than eight varieties, blooming in Angust Arthur E. Griffin, first; John Mahan, second, Best collection of blue and purple flowers blooming in August —William MacGillioray, first; Arthur E. Griffin, second; James Robertson gardener to Mrs. T. O. Richardson, third.

Pest collection of pink and crimson flowers blooming in August William MacGillioray, first; Arthur E. Griffin, second; James Robertson gardener to Mrs. T. O. Richardson, third.

Pest collection of pink and crimson flowers blooming in August William MacGillioray, first; Arthur E. Griffin, second Best display of named varieties of roses blooming in August John B. Urquhart, first.

Best exhibit of Calceolaries—James Boyd, first.

NEWPORT HORTICULTURAL SOCIETY AWARDS.

### NEWPORT HORTICULTURAL SOCIETY AWARDS.

NEWPORT HORTICULTURAL SOCIETY AWARDS.

Best group of palms, ferns foliage and flowering plants tastefully arranged in space of 100 square feet, 50 per cent, for originality. James Bond, first.

Best six plants for pots not exceeding 12 inches, to be shown in iardinieres suitable for house decoration—James Robertson, first; James Boyd, second; James Bond, third,

Best six plants of Caladiums in pots or pans not exceeding 8 inches in diameter. James Bond, first; William MacKay, second.

Best specimen Kentia in a pot or tub not exceeding 12 Inches in diameter. James Boyd, first; James Bond, second.

Best specimen palm any specie without restrictions as to size of pot or tub. James. Robertson, first; James Boyd, second; James Bond, third.

Best specimen Adiantum Farlevense or Farleyanes.

ming. Best specimen Adiantum Farleyense or Farleyense Gloriosa—John B. Urquhart, first; William MacKay, second.

Best specimen fern other than Adiantum Farleyense or Farleyense Gloriosa James Boyd, first; James Bond, second; John B. Urquhart,

third.

Best 8 variegated joliage plants in pots not to exceed 8 inches in diameter James Boyd, first; James Bond, second.

Best basket, pan or dish of Adiantum Farleyense, receptacle not to exceed 15 inches in diameter. John B. Urquhart, first; William Mac-Kay, second.

Kay, second.

Best basket, pan or dish of ferns other than Adiantum Farleyense, receptacle not to exceed 15 inches in diameter—John B. Urquhart, first; James Bond, second; William MacKay, third.

Best basket, pan or dish of foliage plants, receptacle not to exceed 15 inches in diameter James Bond, first; William MacKay, second; James Boyd, third.

Best 25 Gardenia blooms—John B. Urquhart, first; James Boyd, second; William MacKay, third.

Best 25 American Beauty roses John B. Urquhart, first;

Best vase of 25 Tea or Hybrid Tea roses, outdoor grown—John B. Urquhart, first; Andrew Ramsay, second.

Best vase of 25 Tea or Hybrid Tea roses, indoor grown Arthur E. Griffin, first.

Best vase of Griffin, first.

Egriffin, first.

Best centerpiece -James Robertson, first; William Allan, second; Andrew Ramsay, third.

Best fancy basket William Allan, first; David Boyd, second; Andrew Ramsay, third.

Best display of Dahlias—J. K. Alexander, first; James Robertson, second; W. D. Hathaway, third.

Best display of Dahlias, six varieties -James Robertson, first.

Best table decoration of any material such as plants, flowers or fruit, with which the exhibitor may use silver, glass or table ornaments. Floral decoration to count 50 per cent, and to be made and arranged in the hall by the exhibitor. Table to seat not more than twelve—Gibson Bros., first; Joseph Lickens, second; David Boyd, third.

Best 24 plants Gloxinias—James Watt, first; Oscar Schultz, second. The Garden Club Sweepstake Cup for the best exhibit in the show was awarded to Oscar Schultz for a well arranged bed of Coniferae. The Mrs. French Vanderbilt Cup for the best exhibit by a private gardener was awarded to James Bond for his group of flowering plants.

William Trickey of Arlington N. L. was awarded a silver model. Second William Trickey of Arlington N. L. was awarded a silver model.

plants.
William Tricker, of Arlington, N. J., was awarded a silver medal for new water Illies. John P. Rooney, of New Bedford, Mass., bronze medal for Dahlia Mrs. Frederick Grinnell. Gratuities were awarded quite a number of other special exhibits of merit.

The judges were William Anderson and Joseph Clarke, of South Lancaster, Mass.; William N. Craig. Brookline, Mass.; John Greatorex, Victor May and John T. Allan, of Newport.

#### THE AMERICAN GLADIOLI SOCIETY SHOW.

The sixth exhibition of the American Gladioli Society Show, which was held at the Casino, Newport, R. I., under the auspices of the Newport Garden Association and the Newport Horticultural Society, was said to be one of the finest shows of Gladioli ever staged in this country. The Casino Theatre was a grand sight looking down from the balcony. The Chas. F. Fairbanks exhibit, which completely filled the stage, was a very artistic display, and was awarded the silver medal of the Newport Horticultural Society. The main floor of the theatre was taken up with the competitive exhibits and the broad piazzas of the theatre were filled with the trade exhibits. In the class for the best collection and display, exhibits were put up by B. Hammond Tracy, William Sim, T. A. Havemeyer, Knight & Struck, John Lewis Childs, and Arthur Cowee. The prizes in this class being won by B. Hammond Tracy and William Sim, first and second, respectively.

Important awards other than in the competitive classes were as follows: A. E. Kundred for new seedling gladioli, "Mrs. Dr. Norton," first class certificate of merit, exhibited by L. Merton Gage.

R. W. Swett for gladioli "Liebesfeuer," first class certificate.

C. M. Bogholt, for an exceptionally well-grown vase of gladioli, "Europa," cultural certificate.

John Scheepers & Co., for seedling yellow gladioli

3/7229, a first class certificate.

John Lewis Childs, certificate of merit for new gladioli, "Newport."

Honorable mention to Brookland Gardens for seedlings, and W. A. Burpee & Co. for early flowering strain from seed. A. E. Kundred for Primulinus Hybrids. N. Cowee, John Lewis Childs, Knight & Struck and T.

A. Havemeyer, for displays.

The judges were William Anderson, South Lancaster, Mass.; James Wheller, Natick, Mass.; J. Zerstraten, Saxonville, Mass.; James Robertson, John B. Urguhart, and Bruce Butterton, of Newport.

#### GOLDEN GATE PARK.

(Continued from page 411.)

Oleander fifteen feet in height and the Wistaria fifty feet and the Passion Vine to the tree tops. The Canterbury Bells are as much at home here as in Canterbury itself. The Rhododendron does as well as it doesin the mountains of Virginia or North Carolina, in England or the Himalayan Mountains. All grow together in the same bed.

The beautiful Rhododendron Falconeris opens the season by blooming in February, the other Punjab species, such as the Nobleanum, carry the season until the hybrids bloom in April and May, as do the Catawbiense, after which the woolv leaved, white flowering. lily scented Campanulatum carries the season until late in July. So it is with Azaleas, both evergreen and deciduous, native and exotic, all are doing well and tell the story of our climate.

Of course, our summers being dry, no rain falling from May until October, the country looks dry and brown compared to the eastern summer effects, still where water is abundant, lawns may be kept in excellent condition even in midsummer or until the October rains begin, two weeks after which time all the country takes on its verdure effect and the hills are green again until the following June.

On account of our rainless Summer, it becomes necessary to provide water in abundance for the irrigation of lawns, shrubs and flower beds. A system of wells and pumps has been constructed in Golden Gate Park with powerful pumps installed by which over two million gallons per day are pumped every day during the dry season. To store this water, reser-voirs at different elevations have been built with a combined storage capacity of over thirty million gallons. These reservoirs, instead of being built in ordinary shape, have been constructed with natural appearing outlines, giving a park lake effect that greatly enlivens the general landscape. In filling these lakes with water from the wells instead of pumping directly into the reservoir the water is pumped to the top of Strawberry Hill, which is four hundred and twelve feet above tide and flows over a waterfall to a twentyfive acre lake located one hundred and twelve feet below, giving our people a very good idea of a natural waterfall.

The Japanese tea garden is a very popular feature of Golden Gate Park, containing as it does beautiful gateways or "Toria," as the Japanese call them, artistic tea houses where tea is served by picturesque Japanese maidens, dressed in their native costume; pretty waterfalls and lakelets with tiny little rills connecting the ponds spanned by their characteristic stone and other bridges, Japanese stone lanterns are everywhere set in clumps of Japanese trees in great variety. In course of construction is a Japanese temple with moat and stone approaches, bronze dragons, Buddhas, eagles

Along the easterly line of the Pacific Ocean under the jurisdiction of the Park Commission is a reservation known as the Great Highway. This highway leads from the famous Cliff House to Lake Merced, a distance of about three miles, and is from two hundren and fifty to three hundred feet wide. It has been reclaimed from the ocean by the sea-bent grass catching and holding the sand drift from the ocean. sea-bent grass holding the sand has built this bank ten feet above high-water to a width of over two hundred feet, on top of which the Park Department has built an oiled macadam driveway where thousands of visitors enjoy the ocean view daily. For autoists it is a very popular drive.

#### HERE, THERE AND EVERYWHERE

#### DON'TS FOR YOUNG GARDENERS.

No doubt some will wonder at the title chosen for my subject. When we remember that the majority of the rules and regulations laid down for our conduct, ever since the creation of the world, have consisted of "Thou shalt not," for which "don't" is our modern substitute. I think we may profitably consider a few "don'ts" which peculiarly affect ourselves. Much has been said and written about raising the status of the gardener. This must be done by ourselves, individually and collectively. No one can do it for us

Don't full to render prompt and cheerful obedience to those over you. This will help to fit you for the command of others, and the work will be more easily and quickly done.

Don't lose an opportunity of learning. Knowledge is power.

Don't be shy in asking questions regarding your work. "He that questioneth much shall learn much."

When working with others; don't always look for the "light end." Do your share, and, if blessed with superior strength, a little more.

When pruning, ton't leave ragged ends; always make a short elean out.

Don't water a plant without first making sure it requires it. A good hand with the watering-can is very valuable.

When planting don't turn the ends of the roots upwards, it is not their natural direction.

Don't forget orders and instructions, it is a poor excuse for having failed in your duty to say "I forgot." Our memories are largely what we make them.

When accidents happen, or crops fail to realize expectations, don't blame subordinates until you have first examined yourself

When entering on a new situation, don't find fault with every thing done by your predecessor. Rather let your energies be directed to obtaining better results, which will speak for themselves and be appreciated in due time.

When successful in growing any particular subject, don't jump to the conclusion that every method except your own must be wrong. Remember more than one road leads to London.

Don't guarrel with your fellow workers. A quarrelsome person

is neither loved, feared or respected.

It successful in lite, don't get swelled head; but thank Him from whom all blessings dow. C. Portsmouth, in Journal of Brit ish Gardeners' Association.

#### FLOWER NAMES, ENGLISH AND LATIN.

"Flowers in literature should be treated broadly and generally. perhaps even vaguely -just as the eye drinks delight from a field of poppies or a wood carpeted with wild hyacinths," writes the Right Hou, George W. E. Russell in a delightful essay on flowers, "taking no account of genera or species and ignoring the jargon of 'frond' and 'stamen' and 'pollen.' Matthew Arnold wrote to his friend Grant-Duff: 'You first led me to try and know the names and history of the plants I met with, instead of being content with simply taking pleasure in the look of them; and you have at least doubled my enjoyment of them by doing so. But, with all deference to my great teacher, I doubt if this is the common experience. Would Wordsworth really have enjoyed the lesser celandine, or Burns the mountain daisy, more keenly because some botanically-minded triend had lectured on their characteristics?" "Scientific nomenclature," the writer continues, "is always hideous, and the botanical habit of labeling or libeling innocent flowers and plants with Latinized nicknames is even painfully incongruous. English names have a tenderness and beauty all their own, simple and homely-yet romantic rose and pink and lily of the valley, and lilac (better pronounced laylock); primrose, daffodil and snowdrop, heartsease and pansy, cowslip and buttercup and forget-me-not, meadowsweet and love-in-idleness, foxglove and bluebell, even cherry-pie, dusty-miller, and old-man's-beard. Over against such names as these set fuchsia, dahlia, calceolaria, pelargonium, ampelopsis Veitchii, odontoglossum, madevallia, Harryana, Blairii No. 2 and Dorothy Perkins, and no one who has ears to hear can doubt that our English forefathers knew better than their descendants the true language of leaf and flower.

But this subject may be argued quite as well from the other side. "Linaria, Saponaria, Salvia, Ajuga, Anthyllis, Potentilla Artemisia—what could be more charming?" asks G. Flemwell in his "Flower Fields of Switzerland." Are they not a thousand times more æsthetic, he asks, "than their English counterparts—Toadflax, Soapwort, Sage, Bugle, Kidney Vetch, Cinquefoil, Wormwood." A writer to the Times, Mr. Flemwell tells us, "bemoans the growing use of Sedum instead of Stonecrop, and of Antirrhinum instead of Snapdragon, and he calls it an immeces-

sary use of botanical terms,' and thinks that 'the want of beautiful English names to many beautiful flowers seems a reproach to their beauty.' But there are other authorities, equally numerous, who hold a contrary view, considering that too much is being made of English names, and that 'confusion worse confounded' is a very natural consequence. One catches the sound of more than two voices in the discussion; one hears not only the several plaints of botanist and flower-lover, but also the claims of the champion of folklore, the mere amateur gardener, the uncompromising patriot, and the incorrigible sentimentalist. And something in reason is said by each one of them -although honors are not so easy as to enable one to call it a case of six of one and half-a-dozen of the other. For, perhaps, those who strive for a langue bleue in this domain and choose Latin have the weightier cause at heart.

"George Crabbe, the poet, once wrote an English treatise on botany, but never published it, because of the remonstrances of the Master of Trinity College, Cambridge, who objected to degrading the science of botany by treating it in a modern lan-Such rigorous adhesion to Latin is of the relatively narrow past; nor is this dead tongue likely ever again to be a subject for such blind idolatry." Mr. Flemwell quotes Alphonse Karr who, in "Les Fleurs Animées," designates the men of learning as "pitiless tyrants," who have "seized upon the frail daughters of sky and dew" and "have thrown them into the crucible of ety-. and as if to assure themselves of impunity, they have hidden their victims beneath a heap of barbarous names." "All this is frightful, is it not? . . . . Unfortunately it is all very necessary." M. Karr continues. "To admire is not to know, and, in order to know, system and method are indispensable. . . How could we do without the help of etymology? Pardon, then, these men of science, who have done nothing but obey the law of necessity, and enter into the beautiful domain from which they have dissipated the darkness.' This," Mr. Flemwell says, "is delightfully put, and is all very true. Latin nomenclature does tend immensely to dispel confusion, though in certain quarters it may wound the sense of sentiment, and we shall no doubt always have confirmed adherents of popular  $\mathrm{names.}^{**} = L_x \, change$ 

#### RECREATION WORK PROBLEMS OF PARK BOARDS.

(Continued from page 418.)

the renting per season of such lockers is justifiable at any fee if the demand for them exceeds the accommodations.

Refectory Service No one, of course, will claim that refreshments, outside of good drinking water, should be furnished gratis, but the claim is made by many that such service should be rendered at cost.

I claim that all such service should be rendered by park authorities through their own employees and not through concessions; that all drinks and foods should be served in the best possible manner and must be of the best quality; and that they should be sold at a reasonable profit to the board.

The following reasons, I believe, will sustain my views and claims in this matter.

First—Park authorities should not enter into unfair competition with others who have to make their living in that business.

Second—The profits so earned can be used to advantage in the betterment of the service, equipment, and in other improvements by which the public will be benefited.

I am of the opinion that in charging reasonable fees for such, and similar services rendered, as herein described, we accomplish at least three distinct desirable things:

First—We gain the means not otherwise obtainable of rendering additional desirable service.

Second—We secure those means through taxing people who make use of that service and are thereby directly benefited.

Third—We are better able to determine what service is really needed, wanted and appreciated, and consequently, we are less liable to spend labor and money uselessly.

#### NATIONAL ASSOCIATIONS

National Association of Gardeners. M. C. Ebel, secretary, Madison, N. J.

Society of American Florists and Ornamental Horticulturists.

John Young, secretary, 54 West 28th st. N. Y.

Westchester and Fairfield Horticultural Society, Fall Show, Stamford, Conn., November 2-3, 1915.

If you are a member of a local horticultural society or a garden club and do not find the report of your association's meetings or other events of it in our columns, their omission is due to the fact that your secretary has not sent them in. Get after him!

#### TUXEDO HORTICULTURAL SOCIETY.

The regular monthly meeting of the Tuxedo Horticultural Society was held in Chicago Fall Flower Show, Coliseum, Chi- the Parish House on September 1st, President Frederick Rake in the chair. The arrangements for our Fall Show, which will be held in the Tuxedo Club House on November 5, 6 and 7, are well advanced. The final schedule will be ready in about two weeks. Everything is promising that the coming show will surpass any of its predecessors. In this year's schedule we are offering special prizes from the following firms: Scott Bros., John Wilks, A. K. Pierson Co., Inc., Charles H. Totty, W. Atlee Burpre Co., Stumpp & Walter, Vaughan's Seed Store, Wm. F. Mc-Cord Co., Bon Arbor Chemical Co., Weeber & Don, John Scheepers & Co., Carters Tested Seed Co., Hitchings & Co., Burnett Bros., Julius Roehrs Co., Harry A. Bunyard Co., Lager & Hurrel. A letter was read from the president of the N. A. G. with reference to the affiliation of a member from one Society to the other. The subject brought out some points in discussion and it was agreed we support the principles of affiliation. Mr. D. McGregor was appointed to Morris County Gardeners' and Florists' fill the vacancy on the Executive Committee Society, Annual Fall Show, October 28, 29. caused through the death of C. Sheppard. caused through the death of C. Sheppard.
Thos. Wilson, Sec'y.

#### LAKE GENEVA (WIS.) SHOW.

The Lake Geneva midsummer exhibition of fruit, flowers, vegetables, farm and dairy Lake Geneva Garden Club, was a pronounced Pembroke Hall, Glen Cove, Wednesday, Ausuccess, both as to the exhibits and attendfar exceeding previous years, competition being very keen in a great number of exhibits. The table decorations were a particularly ladies exhibiting. The floral decorations of by W. Noonin, Thanks of Society. the first prize table were yellow antirrhinums. all tables being most tastefully arranged, and a striking contrast from each other. Cut flower exhibits were very good, considering the wet season, the large collections being very keenly contested. Gladiolis, one of our best summer flowers, was shown in large quantities, special exhibits being staged by Vaughan's Seed Store, Chicago, and A. E. Kunderd, Goshen, Ind. The vegetable exhibit was equal to other years in quality, but the entries more numerous; the fruit exhibit being par excellence, hot house grapes as usual taking the leading part, peaches and nectarines, plums and grapes grown under glass in tubs making a very unique exhibit. A plum tree full of delicious plums, shown by Mrs. Francis T. Junkin, captured a certificate of merit. A certificate of merit was also awarded to Wm. J. J. Mitchell for three Lilium Auratums, grown in eight-inch pots. one bulb in a pot, the three plants showing 112 fully developed blooms. The quality of the exhibits and the large attendance testify as to this exhibition being one of the best yet. The following is a list of awards:

Table Decorations Mrs. J. B. Grommes, 1st; Mrs. S. B. Chapin, 2nd; Mrs. Edward F. Swift.

Mrs. S. B. Chapin, 2nd; Mrs. Edward F. Swift, 3rd.
Corsage Bouquet—Mrs. John J. Mitchell, 1st. Basket Cut Flowers Mrs. Leland 1st; Mrs Grommes, 2nd.
Basket Wild Flowers Mrs. Katherine Lefens, 1st; Miss Chapin, special, 1st.
Cut Flowers and Plants Mrs. T. T. A. Junkin, Axel Johnson, gardener, took 1st in; 12 Phlox, mixed; best 10 varieties Gladiolus, 3 spikes each; best collection of Primulinus, Mrs. T. J. Lefens, R. J. Niles, gardener, 1st in; Antirrhinums, Delphiniums, African Marigolds, One special for Radish.
Wm. Wrizlev, Jr., Chas, Lockwood, gardener, 1st in Delphiniums, six Lilies,
J. J. Mitchell, A. J. Smith, gardener, 1st in; Antirrhinums, Hybrid Roses, Tea Roses, specimen Palm, collection of Gladiolus,
Martin A. Ryerson, Miles Barrett, gardener, 1st in Egg Plants, Kohl Rabí.
N. W. Harris, A. P. Montgomery, gardener, 1st in Sweet Peas, 6 varieties, 25 stems each, Collection of Sweet Peas, no restrictions, group of foliage plants, six Tuberous Begonias, six Rex Begonias, collection of cut flowers, 36 vases.
Mrs. A. C. Allerton, Robert Blackwood, gar.

Vases,
Mrs. A. C. Allerton, Robert Blackwood, gardener, 1st in African Marigolds, 18 varieties, Perennials, collection of roses, collection of Gladiolus, 6 varieties, 5 spikes of each, Mrs. W. S. McCrea, S. Gottar, gardener, 1st special on Dahlia,
Edward F. Swift, R. J. Sampson, gardener, 1st in tomators.

Edward F. Swift, R. J. Sampson, gardener, 1st in tomators.
E. A. Potter, John Topilinski, gardener, 1st in Helianthus.
Mrs. H. H. Porter, Wm. Wahlstedt gardener, 1st in Dianthus, Shasta Daisy, Asters, S. B. Chapin, Chas, Akerson, gardener, 1st in green onions, Parsnips, Parsley, Peas, Potatoes, Currants, Gooseberries, Pears, Cherries.

Potatoes, Currants, Gooseberries, Pears, Cherries,
N. C. Sears, N. P. Pearson, gardener, 2nd in
Rhubarh, Raspherries, Apples, Potatoes,
J. H. Moore, A. Martini, gardener, 1st in
Carnations, Three Forns, 6 white Gladiolus,
string Beans (green), Cabbage, Celery, Onion
Pulbs, Greenhouse Grapes (black), Peaches,
Nectarines, greenhouse grown Grapes,
Seymour Morris, C. Sandegard, gardener, 2nd
in string Beans (green),
C. H. Schweppe, Herman Yakes, gardener,
Lake Forest, Ill., 2nd in Antirrhinums,
F. D. Countiss, Wm. Griffiths, gardener, 1st
in special Gladiolus and Antirrhinum,

#### NASSAU COUNTY HORTICULTURAL SOCIETY

The regular monthly meeting of the Nassau products, held under the auspices of the County Horticultural Society was held in

ance, the number of entries for competition to active membership. Messrs. H. Gaut, J. McCarthy and V. Cleves were appointed judges for the evening, and awarded as follows: 1 vase of 12 asters, mixed, first, A. Walker: 1 vase of gladiola, 12 spikes, first, strong feature, the tables being set for six E. Westlake; 6 ears of sweet corn, first, F. persons, and personally arranged by the Petroccia; Campanala Pyramidalis, exhibited

### Fall Made Lawns Are Best

AKE the question of the time it takes to start the seed for example: in the spring it requires from fifteen to twenty days

it requires from fifteen to twenty days before a sprout comes; while in September only five to ten days. The ground is warm and continues to stay warm enough to rapidly promote root growth long after frost has killed things. Think a minute and you will recall how you have seen green grass even after snow. With the frequent rains we had in August, the ground is in ideal shape for turning over and making an entirely new lawn; or renovating an old one. We can't recall a season for many years when the conditions were quite so as using Alphano to enrich your soil; that part of the work is easily and in expensively solved.

By using Alphano to enrich your soil; that part of the work is easily and in expensively solved.

Being odorless you can use it even right under your dining room window, without offense. Being free from weed seeds gives it a great advantage over barn yard fertilizers, which are bound to bring all kinds of pests to your lawn. So patch up your old lawn; or make your new one now. Have it off your mind for next spring.

Send for our New Lawn Book. You are most welcome to a copo. It tells you in a chatty, interesting way all about the making and care and fare of lawns. It is abundantly illustrated.

#### NORTH SHORE (MASS.) SHOW.

The annual summer flower show of the North Shore (Mass.) Horticultural Society was held on the estate of Mrs. R. C. Winthrop, West Manchester.

Among the more notable displays was that of Mrs. H. L. Higginson, who had a number of small exhibits, and won first prize for the best specimen plant lilium auratum and first prize for best dinner table decoration, a rustic arrangement with a miniature tea garden for a centerpiece.

Mrs. W. D. Denegre (H. Clark, gardener) took second prize for table decoration in sweet peas. Miss Pauline Croll also entered a table decoration in snap-dragon. Mrs. F. P. Frazier won several prizes, including a first for artistically arranged table of hardy herbaceous flowers and first for specimen plant petunia (Rosy Morn). Mrs. Lester Leland (E. Wetterlow, gardener) received many prizes, including a first for best table of flowers arranged for effect, for which Mrs. S. P. Blake took second. Mrs. Leland took first for 12 distinct varieties of specimen plants and Mrs. Lathrop Brown second. Mrs. Leland also received a silver medal for a magnificent group of begonias, first prize for 12 achemines and a certificate for a new geranium. Horticulture.

#### LENOX (MASS.) SHOW.

The Lenox Horticultural Society held its midsummer exhibition in the Town Hall, Lenox, Mass. There was, as usual, a keen competition in all classes. The leading display was the Sweet Peas, which filled half the Hall.

In the class of 24 distinct Peas, Mrs. William B. Osgood Field (G. Foulson, gardener) was awarded first; second, Mr. Geraud Foster (E. Jenkins, superintendent). Both exhibits were of high quality. In the class for one vase, distinct, Geraud Foster took leading

Perennials were also a striking feature in and Mrs. W. D. Straight. the show. Miss Adele Kineland (E. Etherington, gardener) was awarded first for the best collection of 12 distinct varieties, which were elected to active membership. included some novelties.

In the class of 12 varieties of annuals, Charles Lanier (A. H. Wingate, gardener) took first.

A selection of Gladioli was shown by A. N. Cooley, of Pittsfield (E. Edwards, gardener), who secured all the leading awards in this class.

Both indoor and outdoor fruit were exhibited by F. E. Lewis (F. Smith, gardener). who secured first for the best nine varieties; second, Mrs. R. Winthrop (S. W. Carlquist, London Horticultural Society was held in gardener). The fruit was the best that has the Council Chamber, Municipal building, been shown in Lenox.

Mrs. John E. Alexandre (W. Jack, gardener) was awarded first for a collection of outdoor fruit.

Vegetables also came well to the front. Carlos de Meredia (J. Thompson, gardener) won first for the best collection of 18 distinct varieties.

Collection of 12 distinct varieties vegetables, Mrs. Robert Winthrop.

Collection of six distinct varieties, Mrs. J. E. Alexandre (W. Jack, gardener)

There was a fine display of Phloxes, Antirrhinums, Regonias, Asters.

A. N. Cooley was awarded a diploma for an exhibition of Gladioli and a F. C. C. for two new varieties, Europa and Baltimore.

R. & J. Farquhar & Co., Boston, staged a new single Chrysanthemum named Mrs. Charles Daniels.

Wm. Tricker, Arlington, N. J., exhibited a new lavender Nymphæa named Mrs. Woodrow Wilson and was awarded a first class certificate. Mrs. Warren Salisbury exhibited a new Candytuft and was awarded a diploma

All over, the show was highly successful.

The judges were Arthur Herrington, N. J.: Robert Scott, Pittsfield, and Fred Hermans, Lenox. LEWIS BARNET, Asst. Sec.

#### OYSTER BAY HORTICULTURAL SOCIETY.

The regular monthly meeting of the Oyster Bay Horticultural Society was held in Fireman's Hall, Oyster Bay, on Wednesday evening, August 25, President presiding.

J. Sorosick reported for the committee that the outing was a great success.

On the exhibition tables there were a fine lot of flowers, fruit and vegetables, and the following were appointed by the president to act as judges: Messrs, Duthie, Hothersall and Humphreys, and they reported as follows: Society's Prize, for one musk melon, Alfred Walker; 6 ears sweet corn, Society's Prize, Henry Gibson; 6 gladiolus, Society's Prize, James Duckham; 6 peaches, Champion, Frank Petroccia, H. M.; 6 pears, Clapp's Favorite, Frank Petroccia, H. M.; 1 vase single dahlia, Katrine Hoyt, H. M.; 1 fern, Elegantissima Compacta, Henry Gibson, H. M.; 2 cauliflowers, Veitch's Autumn Giant, Chas. Milburn, Thanks of Society; 9 tomatoes, Ponderosa, Chas, Milburn, Thanks of Society; 1 egg plant, Black Beauty, Chas. Milburn, Thanks of Society; 7 parsnips, Hollow Crown, Chas. Milburn, H. M.; 4 vases asters, Chas. Milburn, C. C.; 14 varieties of asters, Alfred Walker, C. C.; 1 vase gladiolus, Jno. T. Ingram, H. M.; 1 vase Lilium, Lancibolm Roseum, H. M.; Jno. Y. Ingram, H. M.; 1 cabbage, Chas. Mills, H. M.; 3 Kohl Rabi, Chas, Mills, Thanks of Society.

Prizes were received from the following for the fall shows: A. T. Boddington Co.; P. D. Cravath, Esq.; Wm. L. Swan, Esq.; Messrs, Stump & Walter; Messrs, P. Henderson & Co.; A. N. Pierson, Inc.; & Don; A. Strauss, Esq.; Geo, S. Brewster, Esq.: Mrs. W. R. Coe: J. M. Thorburn Co.,

Ernest Meyer, Cold Spring Harbor; Wm. Ford, Oyster Bay, and H. Gold, Roslyn,

A prize of fifteen dollars was donated to the National Dahlia Society.

Schedules for the Dahlia Show to be held in October are now ready and can be obtained by sending to the secretary for same.

A. R. Kennedy, Sec.

#### NEW LONDON HORTICULTURAL SOCIETY.

The regular monthly meeting of the New State street, Thursday evening, August 12.

A good number of members were present to hear Donald Miller, of the Armstrong place, whose subject was "Window Gardening and the Care of Flower Boxes." A good discussion then followed the address of the

Stanley Jordan, of the Harkness estate, gave a few minutes' talk on the Newport Sweet Pea Show, which he and several members visited last month.

The exhibition tables were filled with some very fine dahlia blooms, shown by Mr. Steward, an amateur member of the society. were exhibited. S. J.

#### THE HEATING PROBLEM SOLVED

Judging strictly according to mechanical merits, it's the METROPOLITAN PATENTED BOILER you want

Because of their proven scientifically perfect construction, Metropolitan Patented Boilers will heat a given amount of water quieker, with less fuel, and less attention than any other boiler on the market

The remarkable heating efficiency and quick steaming qualities of these boilers are due to their large and effective heating surface.

Just a few points of Metropolitan Patented Boiler merit; Smooth, perfect finished castings.

Push nipple connections

Push nipple connections.

Large fire box, providing ample combustion chamber, and permitting a sufficient charge of fuel to require attention only at long interval.

Peop ash pits making the removal of ashes a slight task Large flues, making the boiler easy to clean.

Grates that are made for hard usage and long service.

And above all, they are Fuel Saving, Not Fuel Wasting.

We also make soft coal boilers which are smokeless, and save 50% in coal

PUT YOUR HEATING PROBLEMS UP TO US.
WE'VE BEEN AT IT FOR 44 YEARS.

#### SOUTHAMPTON (N. Y.) SHOW.

The ninth annual exhibition of the Southampton Horticultural Society was keen. majority of the exhibits were on July 28 and The weather during both days was ideal.

The entries this year were a record and the competition in some classes was very keen. The majority of the exhibits were cut flowers, annuals for the most part, while pot plants and vegetables were also a notable feature.

The chief prize is \$25 offered by the Southampton Garden Club for best 12 varieties of hardy perennials. This was won by Mrs. Pomeroy, of Easthampton (J. Cassidy, gardener). Other noteworthy exhibits were the Gloxinias, exhibited by Mrs. Howard Russell (Wm. McLeod, gardener); these were the admiration of all. The display of vegetables, tastefully arranged, by Mrs. G. W. Curtis (J. Johnson, gardener) without doubt was the central attraction.

Henry A. Dreer's Water Lilies were noteworthy, as were the many displays by the various nurserymen and florists, including C. E. Harkenbach & Sons, Southampton: G. E. M. Stumpp & Co., Southampton and New York; Oak Park Nursery Co., Patchogue; Swan River Nursery Co., Patchogue, and John Lewis Childs, Flowerfield, L. I.

The judges were Messrs, John Canning, Ardsley-on-Hudson; J. Malcolm, Shinnecock Gladiolus from Henry Fuller, park superin- Hills, and W. Halsey, Southampton. Their tendent, and from the Palmer estate also work was carried out in the most satisfactory . manner. S. R. C.

## PROTECT PLANT LIFE

from insect pests and the various fungi with which it is afflicted as it is to properly fertilize it. The importance of this to successful cultivation is becoming more and more evident as more is learned about the growth and habits of vegetation.

a concentrated liquid spraying material, readily soluble in water, is used at various strengths, according to directions on cans.

Aphine is equally effective in the house and garden; free from disagreeable odors of most insecticides, and practical for professional and amateur growers.

It is effective against green, black and white fly, red spider, thrips, mealy bug, soft scale, rose cabbage and current slugs, and other soft bodied and sap-sucking insects. It can be applied to the tenderest foliage, flowers, fruits and vegetables.

Aphine will keep your plants (sweet pea vines, rose bushes,

etc., etc.) in the garden free from insects.

**Aphine** is used by prominent growers as a wash for decorative stock.

Gill, 25c.; half pint, 40c.; pint, 65c.; quart, \$1.00; gallon, \$2.50.

is an oil and sulphur composition three in one, a scalicide, insecticide, and fungicide combined, composed of a high grade of petroleum, and the properties of the well known

fungicide, Fungine. It is a most efficient winter spraying material for San Jose and other scale.

Use one part Scaline to twenty parts water

As a summer spray for hardy trees, shrubs and plants it is an effective remedy against green, black and white fly, red spider, thrips, woolly aphis, cottony maple scale, tulip scale, mealy bug, and all soft scale. Use one part Scaline to forty to fifty parts water.

The sulphur contained in Scaline makes it an excellent preventive against various fungi at all

seasons of the year.

Scaline will rid your evergreens and shrubs of the red spider pest, which has done so much

havor to them recently.

For summer spraying, Scaline is recognized as a marked improvement over the old-fashioned kerosene emulsion; more effective and more economical. It mixes readily with water, contains no sediment, and can be applied with the finest spray nozzle.

Quart, 75c.; gallon, \$1.50; 10 gallons, \$10.00.

is a concentrated sulphur composition, used as a spraying material, readily soluble in water, containing no sediment, and, unlike Bordeaux mixture, and lime and sulphur, does

not stain the foliage, but cleanses it.

It is an infallible remedy for mildew, rust and wilt, affecting flowers, fruits and vegetables, and is used with much success by leading growers on young stock as a preventive against various blights; also against bench fungi. One gallon makes 50 gallons spraying material.

Half pint, 30c.; pint, 50c.; quart, 75c.; gallon, \$2.00.

is a soil sterilizer and vermicide. Destroys cut, wire, eel and grub worms, maggots, root lice and ants. Used one part to four hundred parts water, thoroughly soaking the ground, it will protect your plants and lawns against ravages under the soil.

Gill, 25c.; half pint, 40c.; pints, 65c.; quart, \$1.00; gallon, \$3.00.

These products have the endorsement of leading commercial and private growers, and are generally recognized as standard remedies for the control of the insects and plant diseases for which they are recommended.

For sale by the leading seedsmen throughout the country. If not obtainable in your community, send us your order direct and we will have it shipped to you from our nearest agency.

- Class 9. Table decoration of chrysanthammums for six covers Caccessories the nished and not to count in making award), table 5 feet in diameter.
  - 1st Prize—Gold Plated Flower Vase. 2nd Prize—Silver and Glass Flower Vase

Note.—The prizes, manufactured by the International Silver Co., are now on exhibit at the Country Life Permanent Exposition.

Trade exhibits are invited, but not for competition.

Charles H. Totty, the recognized authority on chrysanthemum culture, will deliver a lecture on Monday, November 1st, on "The Culture of Hardy Chrysanthemums," at three o'clock in the afternoon.

William Knabe & Company will furnish a musical program each afternoon during the show.

An invitation is extended to members of garden clubs, members of local horticultural societies and all others interested, to attend this show and lecture, which will be free to the public.

Further particulars and schedule may be obtained by applying to Mr. Robert H. Sexton, Country Life Permanent Exposition, Grand Central Terminal Building, New York, N. Y.

## Things and Thoughts of the Garden

By The Onlooker.

Some of the finest of all the annuals of the garden are of the western parts of our own land, notably California and the Northwest Pacific region. Of course, California covers an enormous area, with an almost variety of climates, but in the foot-hills along much of the coast the sight of far-stretching acres of Eschscholtzias, Platystemons, Nemophias, Collinsias, Limnanthes, Lupines, Clarkias, Coreopsis, Mimulus, Godetia, Gilia and similar other things which are native there, is one of the joys of California in March and April.

The question I wish to introduce is, How many of these are hardy enough to come through our Eastern winters? Occasionally one comes on a patch of some annual that has passed through the hardest frosts, and in those cases the plants are of the utmost vigor. The foreman of the Bronx Botanical Garden, New York, was surprised to see lots of Summer Cypress (Kochia tricophylla) coming up last spring in a place where he had not recently sown seeds of it. The explanation was that this Kochia had grown there the previous year. Some years ago I had a surprise in finding Tobaccos coming up strongly in the same spot in which they had flowered the last summer. In this case, however, these were not from seeds but were stems from the thickened, fleshy roots. Under favorable conditions the Tobacco or Nicotiana carries over, although just how long it will continue I do not know. Has any one tested this? With our late spring and early summer so often hot, the hardy annuals don't always have the best chance, and now that the autumn is here again, why not make a practical test of a few kinds at least. The trials superintendents on some of the larger seed grounds might enlighten us, if they would, upon the merits and relative hardiness of many of these annuals. Much depends on the early winter season in regard to how these seedlings will behave and on the amount of protection given. Sweet Peas, for instance, which will frequently come through the hardest weather, are killed if the December is so open that growth continues. On the other hand, if there is sufficient frost to check top-growth, all may be well; the roots don't stop. This makes for the safety of the plants in the following June and July, when they remain satisfactory even in dry times. Wherever autumn sown annuals do succeed in passing through December, January, February they assuredly make bigger plants, provided always that they are not too thickly in the ground. One other point in favor of fall

sowing is that slugs or snails find plenty of other food at this time, whereas in spring the ground is bare of nearly all except the tiny garden seedlings.

Speaking of annuals brings to mind the fact that there is a perennial that is better treated as a biennial, namely Coreopsis grandiflora, one of the most useful of border subjects. Treating it in this way maintains the stock in fullest vigor.

A paragraph in the *National Nurseryman* last month called attention to Senecio clivorum. The plant is, to my mind, one of the handsomest that Mr. Wilson was instrumental in introducing from Western China. But why should the merits of these things be so long in becoming widely known? For several years—I do not remember just how many—this semi-aquatic or bog plant has been making golden patches in many English, Dutch and other European gardens and nurseries, vet here as have the American Agricular Nurscreyman treating its readers to a full description of it. Possibly our Boston confrères, who appear to be miles ahead of most of the rest of the country in matters hortulan (and I can give them that credit gracefully, since I am not one of them) know all about Senecio clivorum, and let us hope that so good a subject will make greater headway now. It does splendidly if planted in colonies at the edge of a pond or stream or lake. Let the planting be so that you can see it, yes, and at half a mile away. Puny lots are not effective. It is not a fit subject for the ordinary hardy border, being too vigorous, some might say coarse. The leaves are as large as those of garden Rhubarb, and a strong plant wants as much room as an ordinary dining table. One of the healthiest patches I have seen was on a made-up island in a lake. Here the Senecio had a good depth of strong, rich soil and found abundance of moisture underneath.

It would seem as though Holland bulbs may be somewhat late in arriving this year, at least the last of But there need be no actual anxiety in that Experiments have shown that Tulips, Narcissus, Crocuses, and possibly some other kinds can be planted well into the New Year and still give fairly satisfactory results. A number of years ago one of the largest London houses planted Crosuses on the twelfth of January and succeeded in getting fine flowers in April and May. The same firm tested Narcissi with

equally good results. Last year a friend of the writer's planted Tulips on the 19th of February, and later in the year reported as follows: "My Tulips bloomed nicely the first week in June, and some in a friend's garden that were planted at the same time but in heavier soil flowered one week later." It is also a common practice of commercial men who know their business to take a chance on buying late batches of bulbs, which can often be had at sacrifice prices in December or even January, and by putting them in flats or shallow boxes, place them away, as is done with the potted stock, under ashes, soil, or fiber in cold frames, allowing them to come along very gradually, and so having them in bloom between Easter and Memorial Day. Last year I set out a large number of Tulips, Darwins and late-flowering sorts, in the last days of November, and although the flowers came when those of some of my neighbors were over, there was nothing to complain of in the quality. From an entry in my diary I see that they were at the height of their glory on the 15th and 16th of May. This is in Long Island, N. Y. But perhaps the record for late planting, coupled with thoroughly successful results, is held by Mr. L. W. Acheson, Pittsfield, Mass., who had splendid flowers of Emperor Narcissus in perfection on the 4th of June last year and the "crop" lasted for some time after that. Mr. Acheson regularly cuts this Narcissus for Memorial Day. All this is certainly very interesting, and also shows, does it not, that our knowledge of just how late planting can actually be done without disaster is very limited. Naturally the weather will always be the governing factor, for the most ardent experimenter would not be rash enough to try to plant any kind of bulb if he had to break the ground with a crowbar or a pick axe! Generally, however, there are open periods even after hard weather in December, and if a little care is taken to cover the ground with flakey manure or with some leaves, the early light frosts will not have penetrated far enough to prevent our purpose.

One of the best long stemmed Tulips for forcing is the variety William Copeland. This is comparatively a new comer, of a taking lavender color. It comes easily and quickly, being in bloom early in February. This is early for a Darwin, such as this is.

While on the matter of bulbs, has any reader tried growing on those that have been forced? Some years ago, while visiting my father-in-law at Christmas, I filled two or three large brown paper bags with Tulips that he had forced for the Christmas market and was throwing away. He had hundreds, or it may be thousands, of them, and I asked whether it would not pay him to save them and plant them out-of-doors, as there was plenty of ground to spare. He thought not, it being better to get a new supply from Holland each season. However, the few I took were planted, just as they were, with their tops cut off clean across the top of the bulb. It was pretty rough treatment to plant out in the cold soil in January, Tulips that had been forced in a temperature of 65 or 70 degrees, and which, moreover, had had all their foliage removed. Nevertheless they made some new roots and developed offsets of sufficient size to carry them over for the next year when a few flowered. They were left where they were and in the second spring from planting they bloomed most brilliantly. These were the double varieties Murillo and Rex Rubrorum. The results were gratifying to me, as experimenter, and surprising to the old gentleman.

Talking of keeping a diary, surely this is one of the most essential things a gardener can have. He is dealing with crops, weather, fertilizers, all that pertains to the living plant, and is apt to forget just what the results of one season were unless he writes things down. This applies particularly to dates of sowing, maturing, flowering, harvesting, and so on. The matter of good or bad color combinations is another thing that requires to be put down in black and white. Experienced elderly men don't require these helps, especially if they have been on a place a long time; but to the beginner or young man the diary is simply invaluable. The difficulty is not to keep a diary but to keep it properly, consistently (could it be a "diary" otherwise?) and sufficiently full. It is not until in after years, when we are called to undertake some considerable and responsible work, such as a drainage scheme, the building of a row of cement frames and pits, the puddling of a pond, the surveying and leveling of ground, or the keeping up of a supply of vegetables for a large family all the year round, that we discovered the weaknesses in our note-taking and wish we had taken pains to be more explicit. It furnishes practice in writing, spelling, and in habit of taking care, without which nothing great has ever been accomplished.

The rock-garden idea is still engaging attention, and indeed as these notes are being read, many a new rock garden is either being planned or is already well under way. All the time one hears of new ones finished or contemplated. Thomas Roland, the successful florist at Nahant, Mass., completed a rockery last spring, one that he is immensely proud of, and which proves that he is just as clever in his outdoor field of gardening as he is under glass. Some time ago W. A. Manda, of South Orange, N. J., read a paper on hardy plants at Boston, and the selection of plants he recommended is worth being reprinted, although it is not, by a very long way, intended to be exhaustive. The list is as follows:

Achillea repens.
Ajuga reptans.
Anemone japonica.
Anemone japonica alba.
Festuca glauca.
Iberis sempervirens
superba.

Aquilegia hybrids.
Linum perenne.
Armeria maritima.
Arrhenatherum bulbosum
Campanula carpatica.
Cer astium tomentosum.
Dianthus plumarius.
Dianthus plumarius albus.

Perhaps in another number of the Chronicle I will add to this list.

Dianthus plumarius

plenus.
Dianthus superbus
(and others)
Dicentra eximia.
Papaver nudicaule.
Phlöx amoena.
Phlöx subulata.
Plumbago Larpentae.
Polemonium caeruleum.
Sedum (several kinds).
Thymus serpyllum.
Viola cornuta.
Dicentra eximea.

Irises (dwarf kinds).

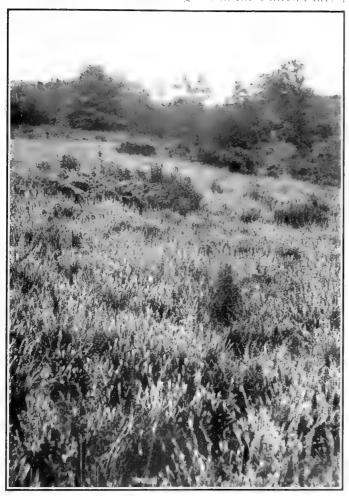

The New York Botanical garden is a highly useful institution, but from a horticultural point of view it would be greatly strengthened if at least one of the larger houses were given over to purely show purposes. Such a house should have a bright display all the year round; in summer, of course, a much quieter exhibit would suffice. A well-kept show house would mean a great deal of labor and attention, but the results in pleasing and educating the public to a better love of gardening would far outweigh any extra cost the upkeep might entail. At present the great city of (Continued on page 400.)

## Growing Scotch Heather In American Gardens

By William Anderson, Mass.

The accompanying illustrations show the Scotch Heather, Calluna vulgaris growing on the estate of Mr. Bayard Thayer, Lancaster, Mass. Over 45,000 plants of Heather have been planted on this estate, and are doing well. With the exception of about 3,000, which were raised from seed, they have all been propagated from cuttings, and planted in their present location under the direction of the writer within the last five years.

Heather is not difficult to grow in the United States,

SCOTCH HEATHER PLANTED IN POSITION INPOSED TO SUN AND NORTHWEST WINDS.

and when planted in fairly moist soil will stand the full sun. A situation should, however, be selected where protection is afforded from sweeping winds in February and March.

Fig. 1 shows Calluna vulgaris, C. vulgaris alba, and Alba var Hammondi planted on a hillside in the full sun, and exposed to sweeping northwest winds. The tops were killed back some last Winter, but started up again in early Spring, and was in full bloom when photographs were taken, September 6. These plants have been growing in their present location for four years. For the first two years the ground was kept cultivated between the plants, but the growth became so thick that this was discontinued, and since then thousands of seedlings are beginning to appear under and between the older plants.

Fig. 2 shows a planting put in two years later and

in a more sheltered location, and which has come through the last two severe winters in good condition.

Fig. 3 shows Calluna vulgaris in an entirely different and more favorable location. It is used as an edging and undergrowth for a bed of Hybrid Rhododendrons. Where the Rhododendrons stand clear of each other it allows room for the use of the Heather underneath, and used in this way is very effective. The plants shown in the picture are growing in moist, rich soil, well protected from cold winds in Winter, and from the midday sun in Summer, and it seems to suit them admirably. The cuttings from which these plants were grown were put in November 1, 1913, and planted in their present location last spring, or just eighteen months later. Although a good many varieties have been tried here, only the three following named kinds have proved to be hardy, C. vulgaris, the common purple Heather; C. Vulgaris alba and Alba Hammondi.

While we have raised the plants from cuttings and seeds I prefer the cuttings; they are more economical to handle than the seedlings, and give less trouble. Cuttings about two inches long should be taken early in November, and put in pans in sharp sand, and if kept in a temperature of 45 degs, to 50 degs., and kept fairly moist, they will callous nicely during the Winter, and begin to make root about March 1. About the middle of May the rooted cuttings can be

SCOTOR BY ATHUR PLANTID IN SHETTER COSTION WHITEMAN AND RESON IS SHEN IN THE THEFT

SCOPER HEATHER COMPLEY A VEGARIST USED AS AN EDGING TOR A SERVICE RHODODENDRONS

planted in a frame three inches apart in a light loam, to which has been added some leaf soil and well rotted manure. Shade the plants during the Summer with slats; this will prevent drying out too much during the hot weather, and the plants will make much better growth. The slats should be removed early in September. During the Winter a mulch of leaves, with some pine or spruce branches to hold them in place, will ensure bringing the plants through the Winter in good condition. In the Spring they will be ready to be planted in their permanent location.

#### DICTAMNUS FRAXINELLA—GAS-PLANT.

This old time garden favorite all too little seen in the gardens of today, but well deserving of a place in every one of them, is a herbaceous perennial with a woody base. Its generic name Dictamnus is a Latin word taken from Dictamnos, an old Greek word, and some say, is supposed to indicate the fact that the foliage of this plant is like that of an ash tree, its specific name Fraxinella, meaning a little ash tree, certainly conveys that idea. This plant grows in strong, upright clumps and reaches a height of three feet, and its abundance of flowers, in one variety white, and in others purple, and rosy-purple, make it one of the most beautiful plants in the hardy herbaceous garden. Indeed, it is attractive to the eye, not only on account of its blooms, but its foliage also is handsome throughout the season and is decidedly and pleasingly lemon scented, and the whole plant emits an oily resinous matter, which in a warm Summer night, if a lighted match be applied, especially right under the flower cluster and close to the main stem, will emit a flash of light, hence the name Gasplant.

It is called Burning-Bush also, because the flowers of the rosy-purple variety in contrast to the plant's dark green foliage appear somewhat like a flame of The name Dittany is from the old English word dytan, which is from the old French dictame. which is from the Latin Dictamnus, which in turn is from the Greek Dictamnos. It has been stated at the

In raising Heather from seeds a soil composed of equal parts of peat loam and sand is most suitable. Sow about February 1 in pans, covering the seed very lightly, and place in a temperature of 55 degs. When the seedlings are large enough to handle they should be pricked off into flats, and grown in a temperature of about 50 degs. About May 20 they can be transplanted into frames, and given the same treatment already recommended for cuttings. Seeds sown February 1, if not pinched, will flower the following Sep-

beginning of this brief monograph that some say that the word Dictamnus is supposed to indicate that the foliage of this plant is like that of an ash tree. Henderson in his "Hand Book of Plants, etc.," and Bailey in the latest edition of his "Standard Cyclopedia of Horticulture," have both made this erroneous statement. Dictamnos, the Greek name, was given to this plant, because it grew in perfection on Mt. Dicte on the island of Crete, Dictamnos being derived from Dicte. As the linguists would say Dict. the root of Dicte plus amnos (meaning belonging to), hence the word Dictamnos, Greek, and Dictamnus Latin, means something (in this case a plant) belonging to Dicte. The word Dictamnus does not therefore, indicate that this plant has leaves like an ash tree, but Fraxinella, the diminutive form of the Latin Fraxinus, an Ash tree, and meaning a little Ash tree does indicate that the foliage of this plant is like that of an Ash tree and in fact it has that form.

Its permanence in the garden is also remarkable "Instances are known," says Johnson, "where Dictamnus Fraxinella has outlived father, son and grandson in the same spot without increase, all attempts at multiplying it, to give away a rooted slip to a newly married member of the family having failed; yet the Fraxinella is easily increased from seed sown as soon as ripe in any common garden soil; they will come up the following Spring." This plant. which has to be three years old before it will flower. is a native from Southeastern Europe to Northern

## Desirable Types of Evergreen Plantings

By H. E. Holden, New York.

The liberal use of the various evergreen species in landscape and ornamental treatment will afford many pleasing contrasts and effects. During winter when little else is left to please the eye they are a positive necessity to any landscape. When judiciously arranged as to their future growth, etc., by which is meant their ultimate height at maturity, they afford a never ending contrast in both form and color when viewed against a background of the various types of deciduous species, the effect being heightened by the general blending of both form and color. When the deciduous forms are reduced to their winter bareness the evergreens afford a happy and pleasing relief. Even when they are covered as they often are with a mantle of snow, the effects thus produced are indeed a pleasing picture.

In boulevard planting or in streets laid out on the parking principle they can be advantageously used singly or in groups in the open spaces in shade tree alignments, or where a parking is carried out in the centre of an avenue or street, they can be planted in conjunction with shrubbery in the various borders, etc., or as individual specimens. The dwarfer forms should be used for this purpose and the shrub plantations carefully pruned from time to

time to prevent them getting out of bounds.

In the choice of varieties it is difficult here to make other than a brief reference, as space will not permit a more lengthy treatment. They may be considered in three classes; the dwarf and medium dwarf forms for more or less restricted planting, such as the Retinosporos, Thuyas, Junipers, Yews, etc., the larger forms, such as Spruce, Pines, Firs, etc., for extensive areas, and those forms particularly adapted to screening hillside covers, etc. Among the former class there is almost an endless form, variety and color, and to those already mentioned may be added several of the dwarf Pines and Spruce, Pinus Mugho, Pinus Cembra, Pinus Koriensis, Picea Gregoriana, Picea Pumilla and Picea Pygmea, etc. They are seen to better advantage in borders or groups and are indispensible when certain effects are desired. Of the other two groups certain types stand out by themselves. In the Pine family mention should be made particularly of the following: Pinus Austriaca, a quick grower and extremely valuable in exposed hilly situations; Pinus Strobus, one of the best under many general conditions. and Pinus Sylvestris, the latter especially suitable for windbreaks. Pinus Excelsa, Pinus Resinosa and Pinus Rigida are also excellent species. Among the Spruces perhaps the Norway Spruce, Abies Excelsa, is the universal favorite. There are several other types, however, much to be preferred, such as the White Spruce, Picea Alba and Oriental Spruce, Picea Orientalis, both being a similar but much better form than Excelsa and very hardy. Particular reference should be made to the following excellent forms; Picea Pungens, Pungens Glauca and Kosteriana, the latter a selected type of the former, and grafted to retain its form and color. Also Abies Engelmanni, Douglasii, Concolor, Nordmanniana and Pectinata, affording a wide range of color and form. Some of these, especially Douglasii, require a deep, open soil to properly develop.

Our ever popular native Hemlock, Tsuga Canadensis, may be considered one of our leading and most useful types. Its general adaptability, graceful form and rapid growth places it in the forefront of the evergreen species. As windbreaks, for screen planting, as individual specimens or grouped with other types and even for hedge

planting where it can be sheared to a dense form, this type is always useful and indeed indispensable. Tsuga Carolinaensis, or Carolina Hemlock, is a distinct form of this variety from the Carolina mountains and an excellent addition of more or less recent introduction.

In exceptional soil conditions where ordinarily few evergreens can be grown at all mention should be made of the following: Pinus Banksiana, especially adapted to dry, loose soil and capable of withstanding extreme drought; Pinus Sylvestris, often used as windbreaks and in sand dune situations to prevent drifting; Pinus Thunbergii in poorest soils; Pinus Flexilis for rocky slopes. For specific data where such extreme planting problems exist excellent and correct information can be readily secured from the United States Forestry Service at Washington.

#### USE AND PLANTING OF EVERGREEN SHRUBS.

It is in this latter type that we have the combined advantage of an evergreen foliage and effect throughout the year, together with a gorgeous and varied coloring during the blooming period. The Hybrid Rhododendron, native Rhododendron and Kalmias, Andromedas, several forms of evergreen Azaleas, etc., etc., form a splendid group, and an exceedingly useful one when certain effects are desired. For Woodland borders or more or less shady situations where little else will be found effective, they are always a welcome addition. It is not necessary as is often thought the case to confine them to such situations. Where the proper borders are prepared and a liberal mulching applied from time to time they can be successfully grown in more or less open situations.

Selection of varieties should be confined insofar as the Rhododendron types are concerned entirely to those known to be hardy in this country, among the best of which may be mentioned the following: Abraham Lincoln, Charles Dickens, Everestianum, Gen. Grant, H. H. Hunnewell, H. W. Sargent, Kettledrum, Lady Armstrong, Mrs. Milner, Purpureum Elegans and Grandiflorum, Roseum Elegans and Grandiflorum, Album Elegans and Grandiflorum, etc. Then, again, there are the Native Rhododendron Maximum and Catawbiense, and also the Native Laurel, Kalmia Latifolia for mass planting in wooded situations where the high coloring of the more expensive Hybrid sorts are not considered necessary. These are collected from their native habitat, and can be purchased at very reasonable prices from leading nurserymen either in car load or smaller lots.

A common error seems to be that the Rhododendron will not stand severe winter conditions. In their native state they are usually found in high and severe altitudes, notably in our own Allegheny ranges and in the Himalavas of Northern India. Briefly a southern exposure should always be avoided, it is the continued freezing and thawing suffered by plants so placed that result in their destruction, not the cold. Most of the suggestions above covering the Coniferous Evergreen species may be applied in like manner to the Evergreen Shrubs. They require a good, rich fibrous loam with a liberal admixture, but not an excessive use of peat, leaf mould or other vegetable humus. Plenty of good, rich top sod, dug into the border, will be found an excellent medium in supplying the needed vegetable humus, but it should be allowed to rot down well before planting is done. Prepare if possible a season ahead of planting. It must especially be remembered that the presence of lime or chalk in the

soil will prove fatal to Rhododendrons and must be avoided.

Border planting is much to be preferred to individual planting, and after the border has been carefully prepared and the plants set out a liberal covering or mulching of leaf mould or partially rotted leaves will serve as an excellent protection and aid. A good watering just after planting and before the mulching is applied to the ground is desirable. Rhododendrons and in fact nearly all of the Evergreen Shrubs carry a very fine root fibre very near the surface of the soil, and a good mulching is therefore essential if the roots are to be protected from the sun and drying winds, and the necessary moisture thus conserved. For this reason also it is especially necessary to avoid any digging of the soil or heavy hoeing of the border after planting. Weeds should be pulled out or destroyed in such a manner as will disturb the soil as little as possible. The writer has personally seen many excellent borders and Rhododendron plantations practically ruined, and in one case in one of our leading park systems through apparent ignorance of this fundamental rule.

Where plantations are made under woody surroundings, or otherwise protected or shaded situations, winter protection, other than the liberal covering of the soil with leaves usually applied in any event, is rarely necessary. Where planted in more open situations (avoid at all times a decided southern exposure) some protection is advisable and necessary. Native Spruce, Cedar or other dense evergreen trees are often cut from the woods and set upright in the soil close together, forming a screen right around the border and serving as an excellent windbreak and shading for the plants. Plenty of leaves added as a covering to the soil will keep it and also the plants in good shape through the most severe weather.

To any one who has had the pleasure of seeing the Hybrid Rhododendrons in bloom in Prospect Park, Brooklyn, not to mention the native types and Kalmias, etc., planted there, the display will afford a lasting recollection and a splendid object lesson of what can be done with this species under very many different conditions and surroundings.

#### A GIANT MARSHMALLOW.

To create a flowering plant whose blossoms measure one foot across, and which is more than three times as large as the original common wild flower found in the vicinity of New York City from which it has been developed, is an achievement of the nursery firm of Bobbink & Atkins. This is the result of over seven years of experimental effort.

"We began," said Mr. F. L. Atkins, "with the wild flower known as the Marshmallow and which at this time of the year covers the New Jersey marshes in wild profusion. We selected the best specimens that could be found, took their pollen and crossed them with the best examples we had of the Hibiscus Coccinea. The next year we took the healthiest specimens of this hybridization and fertilized them from each other. Each year this process has been continued, until about two years ago when we began to see the remarkable results."

On the extensive nursery of this firm there are now whole fields of this giant Marshmallow whose height ranges from six to nine feet, each stem, bearing a multitude of huge blossoms. The colors range from

NEW HYBRID GIANT FLOWERING MARSHMALLOW.

pure white, through the delicate varieties of pink to the deepest crimson. There are flowers of solid color. There are others which are white or pink, with a red centre and others whose variations of shade resemble the Iris. The leaves are of enormous size, are of a rich, glossy green, and in themselves form a unique decorative feature.

The New Hybrid Giant Flowering Marshmallow is the name by which it will henceforth be known.

It is Mr. Atkins' opinion that this flower will give the necessary life and color in the garden and parks from the end of July up to the time of early frost, a period when there is a general dearth of bloom. Each plant is capable of bearing from thirty to fifty blossoms throughout the season, and very little care is required in its cultivation. As one may see from the season of their blooming, very little moisture is required. With the coming frost the stem dies down, and, if cut off close to the ground, the plant being absolutely hardy, needs no protection; and its roots are quite undisturbed, shooting up with renewed vigor the following year.

#### STREET TREES IN NEW YORK CITY.

Professor Laurie D. Cox, landscape engineer of the College of Forestry at Syracuse, N. Y., has just completed a report made as a result of three months' study of street tree conditions in New York City. This study was made upon the invitation of Hon. Cabot Ward of the park department of New York City, and was carried out with the funds given by John D. Rockefeller, Jr. New York City has made no systematic effort to plant its streets with trees, and the report of Professor Cox will outline a practical system of street tree planting, based not only upon the studies of the past Summer, but upon careful investigation of street tree work in such cities as Buffalo, Rochester, Newark, New Haven and Boston.

## The Castle Garden at Heidelberg

The Castle Garden at Heidelberg is particularly interesting from a historic as well as an architectural standpoint. It dates back to the latter part of the sixteenth century, when it was first laid out by Frederick IV., Elector Palatine at Heidelberg. Although the original plan of this garden was made in 1593, the decorative and architectural work was not begun until after 1610, when Frederick V. succeeded his father. In 1612, the ingentious Solomon de Caus von Dieppe, the greatest physicist of his day, came into the services of the king and imme-

garden and of numerous irregular terraces, necessary on account of the hilly nature of the ground, required a great expenditure of time and money. The four principal terraces were partly carved from the solid rock and partly built up with massive arcaded walls. Beneath these are numerous grottos and baths, once gorgeously fitted out and ornamented with curiously carved stones and beautiful statuary of men and beasts disporting themselves in the water. The walls were exquisitely decorated with costly stones, rare shells and variegated corals. Strange

diately began extensive operations for beautifying the grounds. De Caus had been in the service of the Prince of Wales and came to Germany thoroughly grounded in the principles underlying the English art of design and taste. He laid out the garden on a purely English style, and on this account it has always been known as the English Garden.

In 1618, Frederick V. married Princess Elizabeth, the daughter of King James I, of England. In her honor the Elizabethan Gate, at the entrance of the garden, and several other decorative structures within were erected. The plan, as designed and in part successfully executed by de Caus, is an emblem of engineering and architectural skill. The construction of massive walls around the

figures of men and women, animals of all kinds, and especially of birds, adorned all parts of the garden. Myriads of artistic fountains and water rushing down over artificial rock and spreading in beautiful cascades as it descended, were conspicuous decorative features. Numerous small ponds, in which trout and other fish were propagated, formed a part of this private pleasure ground. Extensive beds of the rarest flowers thrived here and southern trees of many varieties were grown in artificially protected spots. At one time fully four hundred and fifty orange trees grew in this garden, while figs, lemons, citrons, pomegranates and bay berries also flourished.

In 1619, Frederick V., Elector Palatine, became King

of Bohemia, but a year later he was completely defeated by the Imperial troops in the battle of Weisseberg, near largue, which terminated his short-lived reign. He lost his kingdom and his hereditary estates and became known as the Winter King. The decoration of the garden progressed until de Caus heard of the King's defeat, whereupon he immediately discontinued the work, went to France and was made engineer and architect to the king.

During the Orleanian Wars the garden went to ruin. But as soon as peace was fully established, the grand dukes again gave marked attention to the castle and its surroundings until the reign of Karl Theodor, who forsook the castle forever and removed the last vestiges of ornaments and statues to Mannheim and to the new park at Schweitzingen in Baden. The Duke of Baden's gardens at Schweitzingen thus became the grandest in Germany. The once renowned garden at Heidelberg was now entire-

ly neglected.

About the year 1800, an association for the improvement of the castle and castle garden was organized. In 1804, Grand Duke Karl Frederick authorized Professor Gatterer, of Heidelberg University, to replant the terraces in systematic order for university purposes. Plants from all parts of the globe were secured, rendering the garden particularly rich in exotic species of trees and shrubs. The most interesting group of trees in the garden consists of a collection of rare conifers arranged very artistically on several of the terraces. A long list of the different kinds of American cone-bearing trees could be made, but a few may be named to show the great variety in the plantation. Among the pines are Pinus virginiana, P. strobus, P. ponderosa, P. lambertiana, and P. taeda; among the spruces, Picea rubens and P. canadensis; among the firs, Abies balsamea and A. nobilis; and to these must be added the eastern hemlock, larch, junipers, and the two Sequoias. But the most remarkable trees near by are several fine araucaria pines (Araitearia imbricata) from Chili, which have developed into picturesque forms, with their lower branches resting on the ground. These evergreens add remarkable cheer and afford visitors a glimpse of the gavest season even in the midst of winter, when the surroundings are sere and melancholy.

Superior horticultural skill is manifested throughout the garden. One delights to linger in the dense shade of the trees, whose boughs spread over luxuriant beds of ivy. Here and there among the trees one finds the most solitary recesses naturally contrived for privacy, shade and comfort. Winding walks, occasional statuary, dilapidated grottos and artificial water falls still remain to remind us of the beauty and dignity of this former Eden. From the large terrace one is afforded a perfect view of the famous castle of Heidelberg, which stands in quaint grandeur overlooking the city as well as the valley of the Neckar and the plains of the Rhine.

## PROTECT THE GARDEN AGAINST WINTER WEATHER.

The United States Department of Agriculture gives the following advice regarding the protection of garden plants and shrubs during the winter in suggestions for

'putting the garden to hed.'

Cover hardy perennials, such as peonies, larkspur, holly-hocks, columbines, iris, platycodons, and perennial poppies, with a good coating of manure or other litter to a depth of 3 or 4 inches. In more southern localities this will hold the frost in the ground and keep the plant from alternately freezing and thawing; in more northern regions the manure will protect the plant from freezing to a depth that will cut off its water supply.

As soon as the tops of cannas, dahlias, gladiolus, caladiums and similar plants are killed by frost, dig up the roots or bulbs and store them in a cellar where the temperature will remain at 55 degrees, and should never go below 50 or above 60 degrees. Do not shake any more earth from the clumps of cannas and dahlias than is necessary in removing them from the ground. Place the plants on racks or in slat boxes so the air may circulate freely through them. No frost must reach the roots nor must they become too warm or dry.

Hydrangeas (semi-herbaceous) in the South will last through the winter out-of-doors, if properly cared for. The tops should be protected with straw or brush. This may be held in place about the bushes with a little manure or stones. The flower buds of the hydrangea form in the fall, and this cover will keep them from winter-killing while shielding the bush from winds and sun. In the North hydrangeas must be taken up, planted in tubs and placed in the cellar. This is generally true of latitudes

north of Philadelphia.

As a rule shrubs should not be trimmed in the fall. This process is timely immediately after the blooming period, if this is in the spring, as in the case of the snowball. If the shrubs bloom in the fall, as do some hydrangeas, the rose of Sharon, and some lilacs, they should not be cut directly after blooming, but in the spring of the following year. Lilacs, snowballs, and mock orange should be let alone during the winter, being neither trimmed nor covered with straw and manure.

Almost all kinds of roses are hardy in the vicinities of Washington, D. C., and St. Louis and to the south of a line drawn between these points. From Washington northward local conditions influence the successful cultivation of certain varieties. Some roses, as the briar and rugosa, need no protection, but other varieties, such as the hybrid-perpetuals, teas, and hybrid-teas, need special care, particularly north of the fortieth parallel. Teas and hybrid-teas hardly succeed in Chicago, although the hybrid-perpetuals grow as far north as Canada. All these classes do well on Long Island and in Boston near the sea when proper care is given them. These varieties in the vicinity of Washington need merely a little manure on the ground to prevent alternate freezing and thawing. Farther north, however, they should be treated as follows:

Cut the tops to within 30 inches of the ground. Cover the roots with coarse manure or leaves or similar litter. Hold this in place by evergreen boughs which also acts as a protection. Brush from deciduous trees or shrubs may be substituted for the evergreen boughs except in the most northern regions.

Mounds of earth about six or eight inches in height should be drawn about the base of the rose bushes to keep them from mice. As an added protection against mice, penit the ground to freeze slightly before winter protection is supplied. In fact, roses should not be protected until after the first light freeze.

In the latitude of Philadelphia and farther south climbing roses usually need no protection during the winter unless they are a particularly tender variety. Farther north these roses need protection similar to that given to the tea and hybrid tea roses.

Where it is possible to do so, remove climbing roses from their supports, and cover the branches with a little dirt. A little fall trimming might be desirable to lessen the space occupied by the branches on the ground. Such side branches as are not to be needed for next season's blooming may be cut off. Such cutting off and shortening of the ends as would otherwise be done in the spring, may be done in the fall before covering, merely for convenience.

#### POINTS IN THE CARE OF HOUSE PLANTS.

Owing to the varied requirements of different plants, it is quite impossible to give accurate directions covering even approximately all cases. A few points, however, such as repotting, resting period, and cutting-back should be mentioned, as failure to take these into account frequently leads to unsatisfactory results, or, in some cases, even failure.

Resting Period.—Many plants used in the house, especially bulbous and tuberous-rooted plants, require a period of rest following the growing season. Such plants, e.g., tulips, callas, hyacinths, narcissus, lilies, etc., following the flowering period, should be given the most favorable growing conditions in order to afford the plants an opportunity to replenish the food materials in the bulbs which were utilized during the flowering period. Following this, the water should be withheld and the bulbs allowed to dry and "ripen." Bulbs treated in this way and prevented from shriveling by placement in sand in a cool, dry place, can be used for flowering purposes the following season. Not alone bulbous plants, however, are benefited by such a rest period, but practically all perennial flowering plants whose growth is discontinuous, i.e., those which show a cessation of growth following flower and seed production. Careful observation will readily enable one to determine whether plants should be given a rest period or not. Practically all bulbous plants, as well as tuber begonias, gloxinias, poinsettias, and many others are greatly benefited by a rest period. In order to bring the plants back into active growth, it is only necessary to supply them with sufficient water; ordinarily it is desirable to repot in fresh soil at the beginning of the new growing season.

Cutting Back.—House-grown plants tend to grow slender and weak because of the usually inadequate and unequally distributed light. by cutting back some of the leading shoots, new growths will usually start from below and tend to produce a bushier and sturdier plant. It is precisely in this way that growers obtain stocky potgrown plants, as illustrated by snapdragons, begonias, etc. On the other hand, the removal of all side shoots and buds tends to make the main axis very strong and the remaining flower buds of greater size and better shape, a procedure the results of which are admirably illustrated in the long-stemmed, single-flowered chrysanthemums. The method of cutting back to be used, therefore, depends largely upon the nature of the plants and the effect and results desired. The cutting back or pruning of woody perennial plants, such as roses, presents new problems, but these need not be entered upon here, as few plants of

this class are ordinarily grown in the house. Repotting.—Plants grown in nots for long periods of time finally become "pot-bound," i. e., the roots become crowded, making it necessary to transfer the plants to fresh soil in somewhat larger containers. If the plant with the ball of soil adhering to the roots is removed from the pot by inverting the latter and tapping gently, on a surface, the condition of the plant can be readily determined without injury to the latter. If the roots are plentiful around the outside of the ball or earth it is an indication that repotting is necessary. It should be remembered, however, that it is, generally speaking, not advisable to repot the plants after the flower buds have appeared, as the disturbance is usually sufficient to cause a retardation in the time of flowering as well as stunting the flowers themselves. In these cases it is better to leave the plant undisturbed, and as a substitute for repotting, supply the roots with liquid cow manure, which may be obtained from florists. Beneficial results will be obtained from this fertilizer, whether plants are pot-bound

or not, if applied just prior to the flowering period. In reporting, the plant with the adhering ball of soil should be removed to a somewhat larger pot, the additional space being filled with fresh, rich soil. In general it is advisable to shift plants at shorter intervals into somewhat larger pots rather than into much larger ones at longer intervals. When plants are freshly potted in the fall just before bringing them into the house, it will usually not be necessary to repot before the following spring. The whole matter of repotting is so important that unless one is thoroughly familiar with the details, it is advisable to have it done by a competent florist or to do it under his direction. This is especially true since the method used is different for different plants, involving also the proper choice of soils.

Water.—Perhaps no one factor is so important in the successful growing of plants in the house as is proper watering. Owing, however, to the striking differences Letween the various kinds of plants as regards water requirements, as well as the differences in temperature, soil, humidity, etc., to which plants are subjected in houses, it is practically impossible to give general directions which will be fundamentally helpful. Practical experience alone, it seems, can teach one the proper use of water for house plants. With the exception of certain desert plants, like the cacti, most plants thrive best in a thoroughly moist soil, and are injured by even slight degrees of wilting. It appears, however, that over-watering rather than under-watering is the more frequent cause of failure. While most plants require a thoroughly moist soil, a muddy or water-logged soiled is in most cases distinctly injurious. Such a condition can be effectively avoided by providing ample drainage. But even where flower pots provided with drainage openings are used the common practice of placing the pots in turn in a jardiniere without drainage provisions leads to disaster. As water drains out at the bottom of the pot, it accumulates in the jardiniere, and, if enough is given, may accumulate to such an extent as to more than saturate the soil with water. Where jardinieres or other vessels without drainage facilities are used, great care should be taken to prevent over-watering. It is in all cases better to use shallow under pans, since the latter will overflow before an injurious amount of water accumulates in the soil, as so frequently occurs where jardinieres are used. If the latter are desired, a form provided with shallow under pans and having provision for drainage should be used.

As regards the frequency of watering, again no definite recommendation can be made. Usually it is not necessary to water house plants every day. Best results seem to be obtained by thorough waterings at longer intervals. In this connection it should be remembered that growing plants need a great deal more water than do dormant ones, flowering plants especially requiring large quantities of water for the full development of blossoms. It is further desirable in many plants to spray or even wash the leaves in order to remove dust and soot which so frequently accumulates on the leaves, to the injury of the latter. This practice besides being beneficial greatly improves the appearance of the plants.—From Missouri Botanical Garden Bulletin.

#### GROWING MELONS UNDER GLASS.

Melons are always appreciated. To grow them successfully it is necessary to have a fair amount of heat at command, to encourage free, healthy growth.

Plants are raised by inserting seeds singly in pots filled with loamy soil, to which has been added a little leaf-mold. Plunge the pots in a propagating frame or over a hotbed to facilitate germination, and when the seedlings appear place the pots on a shelf near the glass to encourage sturdy growth. It is beneficial to syringe the plants with tepid water on bright days, and to support the growths with neat stakes as soon as necessary. Do not allow the temperature of the house to fall below 65 degrees at night, and see that the floor and vacant spaces are damped down regularly.

The border in house or pit should be prepared in good time, so that the soil may be warmed through before the

time for planting arrives.

The best material in which to grow melons is good medium loam. A border eighteen inches in width, composed of two layers of four-inch-thick turf, answers admirably. These turves need not be chopped, but mounds of loam, with a little old mushroom-bed material added, should be placed in position in which to plant the young melons. Given a rooting medium of this description melons grow well, and mature a full crop of fruits.

Plant the melons in due course, and water in with tepid water. Conduct the plants to the trellis by means of light stakes, and keep them tied as growth advances. It is preferable to grow each one to a single stem, therefore do not stop the growth until the leader reaches the top of the trellis. Very little air is needed early in the year, but on fine mornings a little may be admitted through the top ventilators when the temperature of the house nears 80 degrees. Close the house early enough to permit the temperature to rise to 90 degrees by sun heat, and if it reaches 100 degrees no harm will be done, provided the atmosphere is charged with moisture.

When the plants are in flower it is advisable to maintain a light, buoyant atmosphere in the morning to facilitate fertilization, but the afternoon syringing may still be continued. Polinate the female blooms at midday, and endeavor to "set" three fruits on a plant at the same time. Keep the laterals pinched at the first leaf beyond the fruit, and laterals that do not bear fruit should not be allowed to proceed beyond the second leaf.

When the fruits commence to swell feed the plants with a good concentrated fertilizer and weak liquid manure may be given with advantage. Never allow the

plants to suffer from lack of water.

Support the fruits with nets when necessary, and guard against insect pests. As the melons near maturity less water is needed, for if given freely some of the fruits may split; also allow rather more ventilation, so that the best flavor may be produced.

If the weather should be dull and wet at the time the crop is ripening, maintain a genial warmth in the pipes.

#### GROWING CUCUMBERS UNDER GLASS.

Heat and moisture are the chief points in culture. One wants atmospheric moisture in all parts of the house or frame, not merely at the roots. Our large growers, who get such large quantities of these fruits, grow the plants in very high temperatures. give scarcely any ventilation, and, of course, shade the plants from strong sun. By this mode of culture there are rapid growth and no disease. Cold draughts are avoided and heat used freely; indeed, if a house runs up to 100 degrees they trouble little, but give more moisture and shade. One cannot expect Cucumbers to do so well in frames as in houses. There must be warmth to be successful. It often happens that the plants in frames get none too much attention after a certain point, and if allowed to run wild there will be poor fruit.

Stopping and feeding must be done regularly—at least once a week—and plants given new surface soil—say, monthly at least—to encourage surface-roots.

If new wood be not made there are no fruits. It is a safe plan to cut away—say, about every ten days—a portion of the old wood, and lay in the young shoots to take its place. When these are stopped—that is, the points pinched out—embryo fruits appear, and these soon mature.

Over-cropping is a fatal fault. The plants in a young state make so much growth that each joint shows two fruits. These are often left, and the cultivator points with pride to the crop of grand fruit. What is the result? The plants, not having had time to form many roots, are overstrained and unable to perfect the crop. The remedy is to remove a large number of the young fruits as soon as they show. only allowing one fruit to remain to at least 6 inches of growth, and cut when young, as if left they impoverish the plant. Few plants need more food than the Cucumber in a healthy state. The plant does not like great masses of soil at the roots. When starting it is far better to add soil, say, every three weeks, and if at all heavy make it light and porous. The plants like a light free soil, adding such aids as bone-meal freely when top-dressing, and to lighten heavy soils old spent Mushroom-manure is excellent; indeed, too heavy manures are bad. Give food liberally in the way of liquid-manures, and there is none better than cow or sheep-manure with soot added. It is useless to advise fertilizers, there are so many, but use them with care.—Gardening.

#### AFRICAN TAMARIX.

Of all exotics introduced into the United States, the one here named lends itself to cultivation in greater variety of soil and climate than any other of which we have any knowledge. It is equally at home whether it be in the Atlantic Coast States, the desert sections of the great Southwest, or the more salubrious regions of the Pacific Coast. It is found growing at altitudes of 6,000 feet, and in the depression on the face of the earth 200 feet below sea level. The hot blasts of air from the desert does not affect the foliage, nor does a zero temperature injure the branches. It is usually grown as a shrub, often used for a hedge, vet it is a fact that if grown to a single stem, it will attain to the dimensions of a good-sized tree. The light green, feathery foliage is decidious, and that too at a season of the year when sunshine is desired, even in California. The flowers are light pink, very small, borne in spikelets an inch or two long in early spring, and in such profusion that they give to the plant or tree the appearance of a large bouquet.

It is propagated from cuttings, which root more readily than those of the willow, which accounts for its wide dissemination, over hill and plain, on the mountain and in the valley, wherever a man or woman is found who has a love for trees and plants. If it is intended for a shrub, it should be severely cut back every season immediately after the flowers begin to fade, since it is on the growth of the previous season that the blossoms appear.

There are several species of Tamarix, one of which is so densely umbrageous that the branches, when in full foliage, look like huge, green colored ostrich plumes, another blooms during the summer months, but all of them, regardless of their name or nativity, are drouth resistant, and if the owners of the sandy wind-swept plains east of Ontario were to use this subject for a wind break instead of Eucalypts, much of the damage done to the vineyards by sand storms would be prevented, and the landscape wear a more beautiful appearance than it does at present.

There is some confusion in nomenclature of species, which is to be corrected by the Bureau of Plant Industry, and by Bailey in his new work.—Pacific Garden.

## Work for the Month of November

Conducted by Henry Gibson, New York.

The planting of hardy bulbs for spring blooming may be continued so long as the weather remains open, but the sooner this work is completed now the better. No one likes to break up a couple of inches of frozen earth, previous to setting out these bulbs, yet it is what may be

expected if planting is delayed too long.

Planting completed, the garden should receive its annual clean-up. The hardy border is long since past its usefulness for this season, and deciduous trees are shedding their leaves fast. In large gardens where many such trees are accommodated it is always a relief to the gardener when the last of the leaves are down. The leaves should be gathered up as free from sticks and stones as possible for future use. Oak and beech leaves are the best kinds to use in preparing leafmould for potting purposes. Elder, chestnut and maple leaves should be thrown on the rubbish heap and burned. Of course a few of these mixed among a bulk of others would do no harm, in fact when properly decomposed we are of the opinion that all leaves contain valuable plant food. Any ill effects upon plants from the use of leaves in the growing medium, is caused by the varying degrees of acidity found in leaves in different stages of decomposition. Experiments have been conducted which left no doubt as to the injurious effect of acids produced by leaves only partially decomposed upon plant life.

#### THE WILD GARDEN.

The work of cleaning up in and around the wild garden should not be overlooked. When the leaves from the trees accumulate in bulk they are liable to injure many dwarf plants that are growing therein. Wild gardening is becoming very popular now, and as it may be described as a cheap form of gardening it is likely to become more

popular still.

While it is somewhat late to do much actual planting save, perhaps, bulbs in this department; yet notes of additions in the way of trees and shrubs can be made for future reference. Straight lines should always be avoided, and every effort taken to avoid a stiff, formal appearance, when planting is being done. Footpaths may be made now, and these should be irregular and winding. A charming path may be made by using irregular-shaped stones. Too much importance should not be attached to making them fit in evenly, and the spaces between them may be filled in with soil and planted with small alpines. Unshaded positions may be planted with rambler roses of the Dorothy Perkins class. They may be purchased in a variety of shades, and if allowed to trail at will about the ground they will provide a glorious carpet of color when in bloom. Tree stumps, or inverted tree roots can be used to support roses of the Penyance hybrid type. Forgetmenots (Myosotis) are perhaps one of the prettiest plants we have for beautifying the woodland walk. Other parts of the wild garden can be beautified by planting therein large patches of bulbs. It is better to mass them in groups of separate colors, that will attract attention.

#### VEGETABLE GARDEN.

The annual clean-up should be extended to the vegetable garden as soon as opportunity offers, so as to have the ground manured and ploughed or dug up and left to the disentegrating influence of frost and snow. All vegetable matter should be started together for future

use. In this age of motor traffic there is likely to be a scarcity of animal manure and although chemical manures may be largely used as a substitute they do not provide the humus necessary for the successful cultivation of plant life.

Decayed vegetable matter is an excellent fertilizer, and if its true value was more generally recognized very little of it would find its way onto the rubbish heap. All kinds of spent plants, fallen leaves, and even the lawn mowings may be brought into use. They should be stacked deeply in an out of the way corner, and be turned and restacked to hasten decomposition. A light sprinkling of superphosphate of lime may be given at intervals while the work of restacking is in progress. After several turnings the heap may be covered with soil, and when thorough decomposition has taken place it will be found equal to the best animal manure.

Celery, carrots, beets and all other crops not yet stored should be attended to as soon as possible.

Lettuce in frames will need care in ventilation, water thoroughly when needed and stirring of the surface soil at intervals.

Asparagus, rhubarb and chicory can now be forced. Chicory is known as the Christmas salad, and is much in demand during the winter months. Various methods are adopted in forcing it, and our own practice is to plant the crowns six inches deep in good loam under the carnation house bench. Three or four dozen crowns are planted at one time, and at frequent intervals to keep up a succession. When lifted from the garden the outer leaves are cleansed off and only the central portion left intact. The roots are then stacked in layers of sand in a cool cellar and used as needed for forcing.

Parsley should be protected, and some lifted and planted indoors for winter use if not already done. Mint and other herbs may be potted for winter use.

The planting of fruit trees should be finished as soon as possible.

#### THE GREENHOUSES.

The Chrysanthenum season is now in full swing, and the local shows will commence in a few days. Year by year the single-flowered decorative varieties are becoming more popular for conservatory and house decoration, and fortunately skilled hybriders and large growers have turned their attention to the improvement of these types, and many desirable new varieties may be expected at the shows this month. The atmosphere of the flowering house now requires to be cool and dry, firing and ventilation being regulated with this end in view. All watering should be done early in the morning so as to leave the floors and benches dry over night. Flowers cut early in the morning last the longest.

#### SCARBOROUGH LILIES.

Valotta purpurea, or the Scarborough Lily, is a perfect plant for pot culture, and cannot fail to give satisfaction when well grown. It is one of the best of Autumn bloomers. A three-inch pot is large enough for a single root; and no shift is made until it is completely full of rootlets, when a pot only one size larger is needed. The great essential in the culture of the Scarborough Lily is to leave it undisturbed and not interfere with the roots until the plant has grown larger than desired, when it may

be divided. In planting the tops the bulbs should be on a level with the surface of the soil. During winter very little water is needed, and the plants must be kept in a greenhouse, or room, in a light position, and are protected from actual frost. One feature of the Scarborough Lily is that it is evergreen, and curiously enough it is one of the relatively few plants that refuses to hybridize.

#### WINTER FLOWERING GERANIUMS,

Geraniums intended for winter flowering should now be in 5 or 6-inch pots. The flower spikes should not be allowed to develop until the chrysanthemums are partially over. A shelf fixed up in a light position in carnation house where the atmosphere is fairly dry suits them very well.

If the crop of flowers is wanted from Thanksgiving on to the beginning of the new year no more pinching of the buds should be done after the advent of November. Feeding should be done regularly once the pots are well filled with roots. Liquid cow-manure is not to be recommended for these geraniums as a soft rank growth, and but few flowers will result. We find Clay's fertilizer applied as a top dressing is more conducive to the production surface roots, and short jointed, stocky growth that flowers profusely during the winter months.

#### THE EARLY VINERY.

December first is the earliest practical date for starting the early vines into growth; and the house should be thoroughly cleaned and renovated in readiness for a start away at that time. When the leaves have fallen prune the laterals back to two eyes. Fancy canes that have not reached the limit of their allotted space, may be allowed an extension of several feet. It is a good practice to anticipate the future bleeding of the vines, and dress all cuts with some styptic. The condition of the vines during the past season will be a determining factor as to what cleaning they will require. If they were clear of mealy bug, red spider, etc., little cleaning will be necessary. If on the other hand they were badly infested with these pests, every bit of loose bark should be removed, to expose their hiding places, and make it easier for the winter wash to do its work. As an ordinary preventive winter wash (lishurst's compound is effective, and the vines may be gone over several times if necessary.

The border should be attended to, and any mulching material removed carefully. If no surface roots are visible an inch or so of the soil can be removed, and replaced with fresh loam.

Young vines not having the soil extended to the limit may have an addition, if they have thoroughly permeated what they have with roots.

Keep the house as cool as possible from now until starting time. Even a little frost would not be harmful provided it did not enter the border.

#### PRUNING THE SHRUBBERY.

Shrubs may in general be divided into two classes, those blossoming in the spring as a result of blossom buds formed the previous summer, and those blossoming in the fall, as a result of blossom buds formed on new shoots of the same season. Examples of the first class are the lilacs, forsythias, spiraeas, Japanese quince, flowering currant, etc.; of the second, hydrangea, hibiscus, syringa or mock orange, privet and snowberry.

It will readily be seen that to prune spiraeas, lilacs and other spring blooming shrubs while they are dormant would mean the removal of many potential blossoms. For this reason shrubs of this class are not pruned until after the flowering season has passed. At

that time an effort should be made to remove old flowers before they go to seed, as in the case of the lilac, and to head back the straggling shoots as well as remove crowding ones. In the case of Spiraea Thunbergii, scarcely any pruning will be advisable, even at that time, but the Van Houttei should suffer the removal of about half of the canes which have blossomed.

In the dormant state, a shrub, like the Spiraea Van Houttei so much used for the sake of the wreaths of white blossoms, will appear much taller than it will when loaded down with the summer burden of flowers, and while one may feel tempted to cut back the straggling ends of the branches in the spring, yet he finds himself rewarded for not doing so until the summer when he will usually determine on the method of thinning away entire branches rather than heading them back.

Especially where shrubbery is massed in group plantings, and it should preferably always be used that way, does it seem foolish to try and limit the height of the planting in the early spring, and introduce a horizontal or unbroken sky line. To be sure, every one is entitled to his own opinion as to the most pleasing form and height for a shrubbery bed, but if nature were permitted to build her own graceful outlines, and run some shoots up higher than others, the effect would be more pleasing to the eye than where a hedge formation was made the uniform rule. Usually the healthiest wood on the shrub is that at the tips of the branches, but if these are constantly cut back, the shrubs assume a thick top, which in the case of many shrubs is not as desirable as the more natural form when pruning is made to consist of the removal of entire branches which have become old and have served their purpose.

In the case of the hydrangea, and other fall blooming shrubs, however, a heading back in the spring becomes a very desirable practice. There are more buds in the spring than the plant can make good use of, since each one represents a potential shoot which will, if allowed, grow out for a considerable length, and bear as many flowers as the plant is capable of supporting. Accordingly, the limiting factor as to the number of blossoms becomes not, as in the case of the spiraea, the number of buds left intact in the spring, but the vitality of the summer's growth as depending on the soil fertility. By removing one-half or more of the wood of last year's growth on each branch, the strength of the shrub will be confined to a few flowering shoots, with the result that the plant will be kept within reasonable bounds, and a larger size will be attained by the fewer blossom panicles that result.

It goes without saying that decayed stubs should be removed as soon as seen, and their occurrence should be prevented by proper handling of the pruning shears when the wound is first made. If the cut is made to occur at a point immediately above a lateral branch or bud, sap will be drawn up into this branch or bud and the wound will heal over, but if, on the other hand, the cut is made some distance away from any lateral branch or bud, there will be nothing to necessitate a flow of sap in the region of the wound, and the tissue will die back.—*Exchange*.

## French Strawberries and Their Culture

By Edward Connor, England.

The fraise or strawberry ranks amongst the most highly prized fruits in France. It has attained its present preeminence by the ease with which varieties can be crossed by intelligent gardeners; although the varieties grown to-day are legion, they are only "modifications" of half a dozen specific types. The greater care devoted to the cultivation of the fruit of late years has not only brought about a prolonged period of flowering, but it has largely contributed in increasing the size and improving the popular fruit. Strawberries in France are divided into two well recognized classes—the small familiarly known as fraises de quatre-saisons, and the large or grosses fraises. These differ not only in appearance and quality, but in the way in which they are grown. Whereas the small variety is produced from seed, the large variety is cultivated from the stolons or runners of varieties raised from F. Virginia and from F. chilocusis. Strange to say, although the wild variety originated from Greece, classical authors make no allusion to the fact. The aim of growers of strawberries known as Fraises de Quatre-Saisons is to produce a fruit simultaneously large, of a tapering shape, and of a deep red color. In order to obtain the seed from which this kind of strawberry is cultivated, fruits are selected when perfectly ripe and excellent in every other respect; these are crushed with great care and the seeds separated from the pulp, the seeds are next washed and the pulp strained through a cloth. The seed is then collected and left to dry in an airy and shady spot. This seed can be sown in the open air in May and June on a specially prepared plot of ground, but the plants from such seeds are not considered as good as those resulting from seed sown at the end of the month of March or at the beginning of April on a hot-bed. The seed is lightly covered over with leafmould, and air admitted gradually as soon as the plants make their appearance. When the plants begin to throw out a few leaves they are dibbled out in September in tufts of two together, 6 inches apart, and from 12 to 20 inches asunder, on the permanent bed, the soil of which ought to be sandy and fresh, and the spaces between the plants covered with a mulch of short manure. Some growers make a new bed in another place, but do not apply fresh soil. Following the period of planting, the strawberry plants will commence bearing fruit in the second spring or autumn. It is considered well to dibble out the plants from the main stools at a distance of 2 feet apart every two or three years, otherwise it will be found that the plants will quickly degenerate. French growers are careful to avoid employing mould from old mushroom beds, as this tends to redden the leaves, and kills the plants in the end. The subsequent culture is very light and easy, consisting in water being frequently and moderately applied during the period of fruiting and all beds freed from weeds, useless runners and decayed leaves.

Strawberries are procurable so early in the spring that forcing the plants is regarded in France as rather an ornamental than a commercial matter. Plants for forcing are those belonging to the large-fruited varieties, and these are grown in pots filled with good loam. A rich, friable soil, consisting of silicious sand, clay, oxide of iron, and carbonate of lime is that most suitable for strawberry culture and that resorted to in France. The pots are brought indoors or under cover in October and December; forcing commences at a temperature of 55 degrees Fahr, gradually rising to 75 degrees. Gardeners can grow as many varieties of strawberries as they like,

giving each kind a fancy name by way of adding attraction. Varieties having no runners, such as the Gaillon, are naturally good and very suitable for out-door culture. White strawberries are not prized in France, at least, as a rule. The English types have exercised a great influence upon those of France; this remark particularly applies to what are known as the "British Queen," "Keen's Seedling," and "Deptford Pine" varieties. For forcing purposes, the kind of strawberry called "Le Docteur Morère" is in great demand in France; its fruit is large, rose-colored, scented and sugary. The "May Queen" is precocious and prolific, its color is a deep red, and its quality good. The "Margaret Lebreton" suits all lands, is fertile and of remarkable precocity. The "Victoria" is further described by French growers as being a good variety, suitable for poor soil, scented, juicy, yielding well and exacting no special care. All the large-fruited varieties are descendants from the F. Virginia, a native of the United States, and the F. Chiloensis, from the Chilian Archipelago.

The earliest open-air crop of French strawberries comes from Carpentras, in the Department of the Vaucluse, about the last week in April, the supply continuing

till the middle of June.

In the same Department (the Vaucluse) mineral manures were tried a few years ago on strawberries by way of experiment, on the proposition of the then Minister of Agriculture. The result did not come up to expectations. It was found that nitrate of potash, applied in small doses, stimulated the plant too much while destroying the beauty of the fruit.

The finest strawberries for the Paris markets are grown in the Valley of the Durance—once a waste and

arid region.

Strawberries are rich in malic acid and sugar, accord-

ing to eminent chemists.

In France, strawberries—which are said to prolong life—are eaten with red wine, sugar, or sprinkled over with liqueurs, rum, Kirsch, orange-juice or even sugared water. Strange to say, strawberries and cream are not very popular with the French, because this mixture is considered very indigestible. The same objection stands good for white strawberries, which are only fit to eat, according to the French, when freely mixed with the small, deep-red and sugary variety known as "Quatre-Saisons."

Hot water as a substitute for hot houses in forcing early fruit is the latest discovery announced by the National Horticultural Society of France. Results have been published of the experiments of M. Bultel, a prominent horticulturist. He treated 100 strawberry plants for six hours a day with hot water during January and February, and they yielded 722 strawberries up to March 25, while a similar number of plants kept in a hot house yielded only 477 strawberries.

This new method of forcing can be applied to other kinds of fruit. It is very much cheaper, and gives a

greater yield than hot-house forcing.

Miss Gardener: "Can you name this remarkable flower for me?"

Botanist: "It appears to me to be one of the species of the wild flower known as ———."

Miss Gardener (interrupting): "Oh! It is not wild, it has been growing tame in my garden for several years."

## The Popularity of the Dahlia

The increasing popularity of the Dahlia as a favorite flower for the garden was again confirmed by the interest manifested in the first annual show of the American Dahlia Society which was held in the American Museum of Natural History, New York, September 24-25-26. The value of the dahlia as a decorative flower was prominently featured at this show although the displays of individual varieties were never before equalled at a Dahlia show in this country.

While the commercial growers were more prominently identified with the exhibition than the private growers, it may be expected that in another year greater interest will be shown by the private gardener

and amateur in competitive classes.

W. Atlee Burpee & Company, who won the gold medal for the best general display, and R. Vincent, Jr., & Sons Company, who won the silver medal, had splendid collections of many varieties. The especially fine cactus varieties introduced by W. A. Manda within the last year or two, attracted general attention and much favorable comment. John Scheepers & Company, Inc., also contributed a fine collection of seedling cactus dahlias.

Among the private growers who carried off honors were: E. M. Townsend (James Duthie, gardener), Oyster Bay, N. Y.; Mrs. H. Darlington (P. W. Popp, gardener), Mamaroneck, N. Y.; William Shillaber (J. P. Sorenson, gardener), Essex Fells, N. J.; William J. Matheson (James Kirby, gardener), Huntington, N. Y.; Arthur Daly, New York; Mrs. Eleanor F. Fullerton, Medford, N. Y.; Miss Elizabeth Morehouse, Fairfield, Conn.; Mrs. C. A. Stout, Short Hills, N. J.; John F. Anderson, Bernardsville, N. J.; Mrs. E. T. Barrell, Plainfield, N. J. Special prizes were awarded to Bobbink & Atkins and George Stillman for meritorious exhibits.

Judging by current reports many of the Dahlia

shows throughout the country were no less patronized than the important show held in New York, and at many of these community shows there was much friendly rivalry in the competition between professional and amateur growers.

It was no uncommon sight at some of these shows to see men and women passing along the long rows of exhibits, note-book in hand taking notes of the different varieties that appealed to them from which to make selections later to add to their garden collections. With the many hundred varieties exhibited at some of the shows these enthusiasts, no doubt, found much to occupy their time.

As the cultivation of the Dahlia is no difficult task, requiring little more than ordinary care to produce some of the fine blooms seen at the shows, it is not to be wondered that the Dahlia has become such a favorite among garden lovers.

Of the several novelties here illustrated, the introducer, W. A. Manda, says that the Dahlia Mrs. Alfred I. Dupont, is one of the most extraordinary varieties in cultivation. Of good habit it will begin flowering early in the season and continue until frost. Its foliage is of a luxuriant growth, with stems strong and upright, two feet in length, supporting an extraordinary large flower perfectly double. Its color is of the brightest ruby red, showing scarlet under artificial light. It has several times been judged as the best decorative dahlia at important shows.

Another 1915 introduction of Mr. Manda's, the Dahlia Albert Manda, is said to be the largest flowering Dahlia in cultivation, with fine green foliage and stout stems terminating in extraordinary flowers nearly a foot in diameter, of beautiful shades of lemon, white and pink, varying according to season and situation.

The Dahlia Gertrude Manda is a fine grower, with long stems and medium size, but beautifully formed flowers of a peach blow shade of color.

DISPLAY AT THE AMERICAN MUSEUM OF NATURAL HISTORY SHOW, NEW YORK, SHOWING TO WHAT EXTENT THE DAHLIA CAN BE EMPLOYED FOR DECORATIVE PURPOSES. RICHARD VINCENT, JR., FIRST PRESIDENT OF THE AMERICAN DAHLIA SOCIETY, IS SEEN IN THE PHOTOGRAPH.

In the October issue of the Chronicle we naturally look for some comments on Dahlias. This having been a first class summer for Dahlia culture many more people have determined to grow them another season. Truly it is one of the great flowers of all time, and although it may at times go under a cloud for a period that can never last long. With the establishment of the American Dahlia Society and the holding of shows by this body, as well as by the now numerous other societies that make a feature of Dahlias, the time has arrived when an authoritative promulgation on the classification of the flowers should be made. In addition, the A. D. S. ought to publish lists of what are generally regarded as the best varieties, this to be in addition to, or apart from, any election that any of the floricultural papers might attempt. There is always a lot of fun in trying to name what one believes to be the best twelve or twenty kinds of any of the more popular flowers. Here is my vote for the best six Dahlias for general use:

DAHLIA, MRS ALTRED I DUPONT

Delice, Jack Rose, Souv. de Gustave Douzan, Minnie McCullough, Hortulanus Fiet, Princess Juliana.

The only one I have any qualms about in the foregoing is Douzan. It is a big, coarse Dahlia as a rule, but it is one that is very widely grown, is showy and vigorous, and a good, large flowered scarlet. To extend this to twelve let us add the following six:

Geisha, Perle de Lyon, Etandard de Lyon, Mrs. A. I. du Pont, Sebastopal, Ethel Maule.

My own particular fancy leans much to the show and decorative kinds; the cactus ones are also desirable and good for a variety of uses including cutting and garden decoration. Among other fine Dahlias not already mentioned are these:

Arabella, Dorothy Peacock, Beliot, Ethel Maule, Master Carl, Papa Charmet, Rhinekonig, Queen Mary, Kriemhilde, Orange King, Cuban Giant, Golden Gate, Grand Duc Alexis, Chas. Lanier, Kalif, Dreer's White, J. B. Riding, Snowclad, Hilda Searle, Triomphe de Solferino, Rosalie, Little Beauty, Crimson Beauty.

If I were choosing six cactus Dahlias for exhibition the list would be this:

H. H. Thomas, Rev. T. W. Jameson, Yellow Hammer, Mrs. T. G. Baker, Snowdon, H. W. Sillem.

Most likely, however, by another year we shall have more reliable lists than these, although, after all, Dahlias differ on different soils and in different locali-

DAHLIA, ALFRED MANDA.

ties or sections, so that the best that can be attempted at any time is to name those that do best over the widest territory and which are oftenest in high condition. That has been the guide in drawing up the foregoing. —The Onlooker.

DAHLIA, GERTRUDE MANDA.

OCTOBER, 1915.

No. 10.

The results obtained through the campaign to promote the Cleveland Flower Show testify to the general optimism pervading the horticultural trade over the promising business outlook. The success of such a show is entirely dependent upon the willingness of the trade to participate in it, and business men are naturally influenced by prevailing conditions in their consideration of expenditures such as are demanded for flower show pur-

The reports of the success encountered by other managements of important shows to be held this Fall and the coming Spring, are no less promising than of the show first referred to, and this is all of considerable consequence to those engaged in the pursuit of horticulture as indicating that interest is not waning, but is increasing in this country towards horticulture in general. It is claimed by some firms catering primarily to ornamental horticulture that business has been better with them during the past year, while the terrific war has been waging through Europe, than heretofore.

Out-door gardening is approaching the close of its season, but this is no reason why gardening shall be abandoned until warm weather reappears, for, with our modern cold-frames and "toy" greenhouses, which are within reach of those even of moderate circumstances, gardening can now be indulged in for twelve months of the vear.

To those not already familiar with what can be accomplished with the aid of cold-frames or small houses, we recommend a careful investigation, for, besides the genuine pleasure derived from in-door growing, they will find themselves well repaid for the small outlay incurred in the luxuries they may enjoy from fresh vegetables throughout the Winter, besides an abundance of flowers that can be forced even in a small space.

#### THE LATE SAMUEL THORNE.

At a regular meeting of the New York Florists' Club held in their rooms on Monday, October 11, 1915, the following resolution was adopted:

Resolved, That the New York Florists' Club have heard with the deepest regret of the sudden illness and death of Samuel Thorne. That we take this opportunity of expressing our sympathy with the family of our deceased life member, friend, patron and colleague in their bereavement.

We desire further to express our sense of the great loss which the city and community, as well as horticulture, have sustained in his decease. He was a shining example for those who survive him, noted for his resolute industry, uncompromising integrity, wise enterprise, high public spirit, sage counsel and helpful attitude towards those who sought his advice. He was a man deserving of all honors, a conspicuous success in his field of endeavor, an encouragement for all who would follow his example.

We cherish his memory and gratefully testify to his many acts of practical help in our efforts to advance

horticulture in this city.

Resolved, That our secretary be instructed to send a copy of this resolution to the family of the deceased, and cause same to be published in the horticulture press.

(Signed)

Patrick O'Mara, CHARLES H. TOTTY. WALTER F. SHERIDAN.

#### THE NEW YORK SPRING FLOWER SHOW.

The preliminary schedule of premiums has been issued for the International Flower Show to be held in the Grand Central Palace, New York, April 5 to

The premiums offered this year are even more liberal than they were for the 1915 and 1914 shows with some increases in the classes also. Space will not permit publication of the schedule in this issue. but it will appear in the November number of the CHRONICLE. In the meanwhile, those desiring to obtain copies of the preliminary schedule can do so by applying to John Young, secretary International Flower Show, 53 West 28th Street, New York City.

OFFICIAL COMMUNICATIONS

M. C. EBEL, Secretary, Madison, N. J.

#### ANNUAL CONVENTION, DECEMBER, IN BOSTON.

The annual convention will be the next important event of the National Association of Gardeners. It will be held in Boston during the first week of December - Efforts are being made to make the 1915 convention the most successful in the history of the association. An interesting and instructive program is being prepared. It is planned to give up more time than heretofore to the problems of the gardening profession, although entertainment is not to be entirely eliminated. The officers make a strong appeal to all members who can possibly arrange their affairs so as to be able to attend the convention in Boston the first week in December to do so. Fuller details will be published in the November number of the CHRONICLE.

The essay contest is closed. Nine entries were received in class 1, six entries in class 3, one entry in class 2 and no entries in class 4. The essays, as provided in the contest, will be judged by three members of the garden profession and two members of the horticultural press and the winners announced at the armual convention.

The Co-operative Committee has received many responses to the resolution of the Nassau County Horticultural Society on the acceptance of a member in good standing from one local society to another society. Some of the societies have not yet advised what action they have taken on the resolution. It is requested that the secretary, or the local co-operative committee, of these societies inform John W. Everitt, Chairman, Box 290, Madison, X. J., what action has been taken so that the National Committee can make its report at an early date.

The following "specifications" recently accompanied an inquiry to the Service Bureau for a "thorough" gardener:

The aurden comprises about two acres and supplies not only regetables for the main house but also two cottages on the place.

The lanns must be kept in good condition and the roads trimmed; also hedges.

A gardener must understand inside work. We have a small green heuse to which is attached a graperu.

There are also two noung orchards and the gardener generally trims the trees in the rate fall and early spring. A knowledge of gratting would be desirable, also a thorough knowledge of rege tables and of planting hardy borders.

In the winter the gardener has simply had care of the greenhouse in which to aron regetables for table use.

We have two men who act as assistants to the gardener who have been with me for twenty years and are very competent.

We are situated on a farm of 750 acres. We are seven miles from . . . We are one mile from the village and Post Office of Springfield Centre, which has Episcopai, Roman Catholic and Baptist churches, market, stores, etc.

I can use either a married man, farmshing him a house, milk and vegetables from the garden, wood for one stove, 15 bushels of potatoes in the fall and five barrels of apples if we have them to spare.

I will give a married man 850 a month with house and these perquisites. To a single man I will offer 850 a month and his board.

Of course I want a man only with first class references, strictly sober, industrious and thoroughly understanding his work.

The Bureau responded that it would not endeavor to supply a gardener possessing the qualifications demanded at a salary such as stipulated, but would gladly offer its services if the remuneration were increased to conform with the rigid specifications submitted. There was no reply.

There is no doubt, however, that the inquiry if freely circulated brought favorable responses from some directions, and thus convinced the employer who offers such meager wages for a position that makes such exacting demands that there is no justification in asking him to be more liberal towards his gardener, who must have devoted years of study and practice to possess the ability to fill the position—and yet his stipend will not equal the pay of a mechanic who to learn his trade is required to serve but a few years at an apprenticeship.

#### AMONG THE GARDENERS

William Plumb returned to Cuba last month, after spending several months of vacation in New York, to resume his work of beautifying a large Cuban estate over which he presides as general superintendent.

John Conroy, for some years general foreman at the Rose Hill Nurseries, New Rochelle, has secured the position of head gardener on the A. W. Church estate, Portchester, N. Y.

Frank Brunton, formerly superintendent of "Villa Vera," Locust Valley, N. Y., recently resigned that position to develop a 3,000-acre estate on the James River, Powhatan County, Va., the property of Edward McQueeney, of Pittsburgh, Pa. Mr. Brunton's new address is Fine Creek Mills, Powhatan County, Va.

Thomas Hambleton, has resigned his position as gardener to Mr. Garneau, Kingston, N. J.

George Willis, late gardener to John W. Kohlsatt, Stockbridge, Mass., has accepted a position as head gardener to Col. Oliver Payne, Greenwood Plantation, Thomasville, Ga.

John Barnet, late of Faulkner Farm, Brookline, Mass., under William N. Craig, superintendent, is now in charge of the estate of J. D. Lyon, Sewickley Heights, Pa.

Thomas W. Head, former superintendent of the Plant estate, Groton, Conn., and for some years in business for himself, has secured the appointment of superintendent of the J. Ogden Armour estate, Lake Forest, Ill., succeeding Joseph Burgess, who resigned his position to return to England.

Henry Gibson has resigned his position as gardener at Eastover Farms, Oyster Bay, N. Y., to accept the position of superintendent on the S. G. Rosenbaum estate, Roslyn, N. Y.

John Canning, superintendent to Adolph Lewisohn, Ardsley, N. Y., says the chrysanthemum bush plants which he will exhibit at the Fall Show of the Horticultural Society of New York this year will be larger than he ever before exhibited.

John Canning, James Stuart, and William Duckham were appointed a Committee on Securing Exhibits, at a recent meeting of the Executive Committee of the 1916 New York Spring Flower Show.

Quite a number of Eastern gardeners expect to attend the Cleveland Flower Show next month. Some of them will compete.

Fyou are a member of a local horticultural society or a garden club and do not find the report of your association's meetings or other events of it in our columns their omission is due to the fact that your secretary has not sent them in. Get after him!

#### Of Interest to Estate Owners

The National Association of Gardeners maintains a Service Baneau which is at the disposal of all who may require the services of efficient gardeners in their various capacities.

The association seeks the co-operation of estate owners in its efforts to seeme opportunities for those engaged in the profession of gardening who are seeking to advance themselves. It makes no charge for services rendered it endeavors to simply men qualified to assume their responsibilities the position may call for.

When your requirements known to

#### SPECIAL NOTICE.

The annual membership roster, year book and new constitution and by-laws will be published and sent to members next month. If your name, address, title, etc., as used last year or as found on the wrapper of this magazine is not correct, notify the secretary at once if you wish a correction. Members who have not paid their dues for the past fiscal year, will not be listed in the membership roster, and will be dropped from the mailing list unless a remittance reaches the Secretary by November 1.

R. W. COTTERILL, Secretary.

#### A MESSAGE FROM THE PRESIDENT.

The American part of the association may well be stressed during this year. The wide range of the association's membership is at once a notable characteristic; it takes in two nations separated by an arbitrary boundary line; it extends from the Atlantic to the Pacific and embraces a range of diversification in park problems that is truly astonishing.

All parts serve people and most parks are municipal.

From details of administration which are purely local by reason of climate, flora or natural or racial characteristics of our cities, we still have certain aspects of parks and recreation which forsooth separate themselves into divisions. So axiomatic and truthful are these principles it is foolhardy to attempt to ignore them. By keeping in mind the general principles will we the better be enabled to solidify the function of a national association into a valuable working force. Broadening of visions, study of local methods and causes and fellowship are all served at the conventions. No one would desire to lessen the latter advantages, yet there seems a need of a greater discussion of how work was done and the motives underlying the way it was done.

With a view of encouraging more outspoken ways and giving especially the newer and younger members the advantage to be gained by a symposium on parks a tentative list of topics are represented and with it a list of those who are to prepare a paper of 1,200 to 1,500 words on the respective subjects. It is

desired that these papers be prepared about two months in advance in order that the secretary may arrange for changes in time of publication, follow up comments made, etc.

With each article is to appear a brief statement (usually not over 50 to 100 words) by others having distinctly different experiences, opinions or working under contrasting environment. Two articles with comments are to appear monthly and a month left open to canvass the Southern situation and the National and State Park status. . .

Another feature deemed likely to expand the usefulness of the association is a review of the annual reports. To this end it is requested that a copy of the annual report of each city be sent to the president, and it is expected that each month a brief review of those received can be published.

To be more intelligible and suggestive a few comments are made upon the titles given to explain more in detail the ground to be covered. This is, however, merely suggestive and title and scope may be altered by the writers.

1. Considerable insect troubles have been encountered in New England, and the States have made appropriations of several millions of dollars to combat them. What is the present status; are the pests being held in control, are they spreading and to what extent are parasites effective?

The debaters cover the field of greatest affection.

Park buses were not so uncommon in earlier days, but they have largely disappeared, whereas in Detroit they have increased. Why this should occur and how it is done would be interesting according to Mr. Bush's experience.

Mr. Richards can tell of the South Parks activities on the lagoons and out upon the lake—water transportation. Incidentally he may know whether the State Park Commission has succeeded in running boats up the Hudson to Great Bear Mountain.

The British have a host of games we rarely see played on this side of the line. Curling is one of them, and their long winters and plenty of ice give an excellent opportunity for its indulgence. But we do have many fine ice and snow sports, as will be explained by Mr. Wirth and Mr. Walsh.

A few decades ago we remember the powerful argument made by Mr. McMillan of Buffalo (later of Newark) on the use and misuse of exotics. The delegates to San Francisco readily appreciated the handicap were all exotics to be tabooed. Indeed, in

MEMBERS OF THE AMERICAN ASSOCIATION OF PARK SUPERINTENDENTS AND FRIENDS VISITING TACOMA, WASH., EN ROUTE

lower California the exotica are the mainstay of available material. Let us hear from Mr. Cox how the material with high colors could be best used and then have some different viewpoint by the others listed.

Overlapping, antagonistic and complementary uses of vegetation for science and aesthetics has not recently been much discussed.

Thousands of named Crataegus are being planted in the Rochester parks. Varying viewpoints will be expressed by those assigned the task of discussing the duplicate uses of vegetation.

Essex County, New Jersey, has constructed some fine park work in connection with its river front at Passaic and in the Branch Brook Park. Mr. Olmsted, the designer, can give some interesting explanations of the designer's motive in planning the work; Mr. Putnam can discuss some of the most successful depths of water and shore treatment to withstand wave erosion and ice sour; Mr. Miller has had a number of like problems to solve which would be instructive to have told.

Boulevards are the distinctive thing thought about in the mention of Kansas City parks. Their width, planting and assessment of costs could be informingly told by Mr. Dunn.

Mr. Richards can discuss some high class boulevards as constructed in Chicago, and Mr. Donaldson can rehearse what is prevalent in Buffalo, where they are modestly called streets, but which in Kansas City would be known as boulevards.

Some of the general divisions of park work to gain the highest efficiency and most economical cost would be valuable from the man who handles the largest park appropriations in the country. Some of Mr. Wirth's work in gathering the loose ends of a large system and putting it upon an aggressive and progressive basis would be a fine supplement to Mr. Foster's discussion.

Then some of the New York experiences where forms of organization are changed from time to time and city governmental departments are more or less always being "investigated" could

make fine reading as written by Mr. Hamilton.

Driving, boating, walking and picnicing have not become obsolete but modern transportation facilities assist in enabling us to picnic further afield. Whatever the tendencies in this regard, and what are some of the newer facilities offered as described by Mr. Green, will cause us to ponder the merit of different park uses. The debaters can give local sidelights from their angle of vision,

Reduced to three, parks will be one of the things a good Rochesterian will tell as having special pride about in his city. How Commissioner Lamberson has tostered this by the use of music would be excellent reading by the man who has admiristered Rechester parks for many years. Our honorary member, Mr. Loring, could tell some interesting history of how he promoted parks at his former home.

To everyone who has crossed the Rockies, the West never ceases to be a wonderland. And it is not all natural, either. The heroics of nature are paralleled by the work of man, and nowhere more conspicuously than by turning drifting sand dunes into a park beyond compare. Some of the difficulties encountered and the means of surmounting them would be more marvelous than the most romantic fiction if told by the helmsman who steered the eraft through shoals, and rocks to a successful ending at San Francisco, our beloved honorary president, John MacLaren. Some turther comments by a well-informed observer of the work, Miss Fairman, would give further pleasure.

Few cities have made the rapid strides accomplished by Baltimore in her recent park work. Extensive plantations made would easily be a subject that would develop into a most readable article as handled by Mr. Manning. Then to get a totally different viewpoint Mr. Shearer and Mr. Morley will elaborate on

the theme by giving some Southland experiences.

Design and control are large factors in bringing out the merit of any park property. Control involves a knowledge of motives of design, a broad and reasonable conception of human traits and inclinations lest the law enacted for its enforcement be made unreasonable or its administration prove ineffective, absurd or reactionary.

How to sympathetically assist the use of the property and extend its usefulness of service could be viewed from both sides where extremes are often met would furnish a capital subject for Mr. Merkel to discuss and Messrs, Mulford and Koehler to throw on side lights.

Zoological gardens, botanic gardens, art museums and allied objects of public interest frequently find lodgement in public parks, either as a secondary attraction or as a main objective in maintaining the property. Mr. Moore has a considerable collection of animals which may be the basis of a paper and Mr. Merkel and Dr. Baker can give some points on the technique and general scope of conducting the foremost zoos in the country. Mr. Burke also has a fine zoo and would expand on the theme.

Nothing has recently been heard from that New England park statistician, G. W. Parker. What are the latest abstract and abstruse conundrums he is wrestling with? Mr. Wirth, his former fellow-townsman, will have some interesting observations in the light of his rapid progress at Minneapolis, where "statistics," "efficiency" and like waves of popular mandates have been ex-

perienced.

What are we doing with street trees as a supplemental instrument of encouraging park feeling in a community? Mr. Prost is engaged in that field and should relate his city's program both accomplished and prospective. Mr. Levison will be enabled to give a different viewpoint and may be successful in inducing Mr. Solotaroff to write an article and become a member at the same time. But Canada has some excellent object lessons in how to do it as witnessed at Winnipeg and Victoria. Mr. Champion will deal with the former and Mr. Purdy with the latter, and incidentally Secretary Cotterill will gain a new number by getting after Mr. Purdy.

Fluminating the extraneous barnicles that attached themselves

NTION AT SAN FRANCISCO, IN AUGUST. THE GROUP INCLUDES THE MEMBERS OF THE FOCAL ENTERTMINMENT COMMITTEE.

to the playground movement while it was yet a popular issue -What is the wave settling down to as an element of park concern? We found out a deal about what we did not know about play and playgrounds, but sifted down, what is there left about which there is agreement not contested by the moving spirits of the play movement? The administrator of the largest and best playground system, Mr. Richards, can give his ideas and opinions; Mr. De Groot, the foremost of the movement, can add to his admirable address (even though his conclusions are not always endorsed by some park people), and Mr. Shea has had some of the largest experience in the hothed of modern thought.

Towns, cities, counties, States, federal governments and private corporations have left the impress of their park work in parts of the country. One of the remarkable features is that whereby people become enabled to use not thousands but tens of thousands of acres of scenery as parks. Mr. Steinhauer will well discuss what Denver is doing and has done about her mountain parks as a city-county project: Mr. Zartman about the up-State reservation as a private undertaking for the public use, and Mr. Fohn about a reservation created by an individual for a community.

Ottawa is in her way building a national city for Canada much as we are building a Washington, not as a city alone but as a National capital. What her schemes are, her aims, accomplishments and expectations for the near future should be detailed by the man at the helm of her park work, Alex Stuart. A few brief notes on what has lately been accomplished at Wash

ington can be added by Mr. Mulford.

If you can not secure sufficient land, it may be possible to secure water areas and make land in the shallow parts of it. Mr. Thompson has been doing some remarkable work of that kind at Seattle, and would give a new vision of one kind of park making. Mr. Wirth has treated several lakes in a similar way, and would give some of the salient features of that type of work. Mr. Putnam's Boston work will present a new aspect to the above and other examples are to be found in the experiences of Messrs. Miller at New York and Kerfoot at Oakland.

Water sports are increasingly more popular with the extension of a park system, but to note its intensive presence in the everyday life of a people Boston, New York and Minneapolis are good illustrations, especially the latter, because of its general use among the whole citizenship and its abundant use. Mr. Wirth can tell a wondrous story of how water sports may be made a prominent feature of park administration. Mr. Alber and Mr. Walsh

can extend the discussion from local experiences.

Some communities need to scratch and grind for a living and others have wealth literally showered on them, and then park making becomes a live issue. The experience of one of the latter is cited by the example of Hibbing, Minn., and Mr. Wolff will be able to tell us about it. Even when not favored by wealth thrust upon them, small communities do make excellent park history. Mr. Berry will tell what has been done at Colorado Springs, and Mr. Fiske at Racine.

Mr. Loring is to give a special article on park extension methods, citing particularly the stages of development experienced in

Finally, a symposium on work in the South is to be scheduled and later the detail thereof announced. It is to include New

Orleans, Atlanta, Birmingham, Memphis and Dallas.

Without previous discussion with the contributors assigned, it will be gratifying if each one concerned, according to the list as given, will make this announcement personal and sympathetically and generously fulfill his part without further solicitation on the part of the secretary or myself.

If you have any ideas you think should be put in practice by the association to assist in making it the medium it should be. do not hesitate to communicate them to the secretary or president.

Yours for a bigger, better and more influential organization. EMIL T. MISCHE, President.

Summary of proposed subjects and writers:

1. "Insect Affections on Park Acquation." Green of Providence, Shea of Boston, Levison of Brooklyn and Egerton of Albany. 2. "Curling and Winter Sports." Champion of Winnipeg.

Stuart of Ottawa, Wirth of Minneapolis and Walsh of New York. 3. "Park Transportation." Bush of Detroit, Shea of Boston

and Richards of Chicago.

- 4. "Exotic Plants in Landscape Work." Cox of Syracuse, Stevens of Berkeley, Jenson of St. Louis and Sheurer of Los Angeles.
- 5. "Botany in Parks." Dunbar of Rochester, Merkell of New York, Nash of New York, Ohlweiler of St. Louis and Hess of Washington,
- 6. "Waterway Parks." J. C. Olmsted of Brookline, Duncan of Spokane, Putnam of Boston and Miller of New York,
- "Boulevards." Dunn of Kansas City, Richards of Chicago
- and Donaldson of Buffalo.

  8. "Park Organization." Foster of Chicago, Wirth of Minne-

apolis and Hamilton of New York, 9. "Picnic Facilities." Green of Green of Providence, Hill of Tacoma, Laney of Rochester and Goebel of Grand Rapids.

10. "Popularizing Parks by Music," Laney of Rochester and Loring of Minneapolis.

Development of Golden Gate Park." J. McLaren and 11.

Miss Madge Fairman of San Francisco. 12. "Park Plantations." Manning of Manning of Baltimore, Shearer of Los Angeles and Morley of San Diego.

13. "Park Restrictions." Merkell of New York, Mulford of Washington and Kochler of Roslindale.

"Park Zoo's." Moore of Toledo, Baker of Washington, 14. Merkell of New York and Burke of Pittsburgh.

15, "Standardi; ma Park Statistics." Parker of Hartford and Wirth of Minneapolis,

Prost of Chicago, Champion of Winni-16. "Street Trees. peg and Levison of Brooklyn.
17. "Playground Control." DeGroot of San Francisco, Rich-

ards of Chicago and Shea of Boston.

18. "Mountain Parks." Steinhauer of Denver, Fohn of Colo-

rado Springs and Zartman of New York.

19. "Government Park Improvements." Stuart of Ottawa,
Mulford of Washington and Eckert of Niagara Falls.

20. "Construction of Lake Parks." Thompson of Scattle, Miller

New York, Wirth of Minneapolis, Putnam of Boston and Adams of Omaha.

21. "Water Sports and Bathing Beaches," Wirth of Minneapolis, Albers of Cleveland and Walsh of New York,
22. "What Small Cities Can Do." Wolf of Hibbing, Meisen-

22. "What Small titles tan Do. Wolf of Irlong, Melsenbacher of Tulsa, Fisk of Racine and Ellis of Saginav.
23. "Park Extension Methods," Loring of Minneapolis.
24. "What the South Is Doing." Davis of Memphis, Allen of New Orleans, Crist of Atlanta and Brock of Houston.

This list is not final, other suggestions will be made later and volunteers will be appreciated.

Secretary's Notes As we have a literary president this year, the secretary does not have to rake his brain to find something to fill this department, hence the "personal" notes will be omitted this month.

#### CONVENTION TRIP OF PARK SUPERINTENDENTS.

(Continued from September issue.)

(The adventures of the trip from Glacier National Park to San Francisco are described in the following excerpts from the diary of Mrs. John D. McLwen, of Queens, N. Y.

FRIDAY, August 13. Leaving Glacier Park the night previous, to continue our journey through the Rockies, we were called at sunrise to view the crossing of the Great Divide, where the trainwinds back and forth in a seemingly never ending climb over the waterfalls of the Flathead River and along the precipices where the giant Douglas firs seem to reach Heaven, recalling Hood's lines:

"I remember, I remember, The fir trees, dark and high, I used to think their slender tops Were close against the sky.

Here we crossed into the Panhandle of Idaho, along the Pen'd Oreille River that plunges down the sides of the mighty Rockies through the giant pines. Steep grades necessitated the use of three engines. Frequent stops were made for water for the engines at interesting lumber camps and small settlements.

Arriving at Spokane about 8 o'clock we were met by John W. Duncan, Superintendent of Parks, Spokane, and the local committee, who escorted us to the Hotel Davenport. After registering and meeting other members of the committee we boarded the autos, awaiting us, for a trip through the following parks: Corbin, Byrne, Minnehaha and Sinto. Arriving at Manito Park at noon we were entertained at a delightful luncheon served outdoors under the direction of the Ladies' Auxiliary.

After luncheon the auto ride was continued over the boulevards to Cannon Hill Park and the Cliff, through Indian Canon and over the high bridge, where a wonderful vista of Spokane Falls was observed, and various other interesting points, terminating at Natatorium Park. Returning to the Hotel Davenport we were invited to leave the real estate which we had accumulated in the bath tubs in rooms assigned to us, as the City Fathers of Spokane made it a rule never to permit visitors to take with them what they have not contracted for.

After a refreshing bath we assembled in the grand ball room of the hotel, where a most sumptuous dinner was served us, which was followed by an address of appreciation made by the officers and other members of our party and speeches of "Godspeed" by the local committee, after which we proceeded to our train. In walking from the hotel to the depot the veteran of our party, Charles Haible, of Newburgh, N. Y., loath to leave the charms or charmers of Spokane, missed his train. "Father Merkel" endeavored to convince the conductor that the train should be held up until a messenger could be sent out to locate the delinquent, but, failing in his efforts, we had to proceed without him.

SATURDAY, August 14, found us at daylight on the west side of the Cascade Mountains, after passing through the long Cascade Tunnel. Emerging from the tunnel we went rapidly down grade through miles of snow sheds, past green mountains, clear little falling streams, and out into the fertile valley, reaching Everitt, the Pacific terminal of the Great Northern Railway, at 7 o'clock.

Arriving at Seattle about 8:30 in the morning we were met by Roland W. Cotterill, the secretary of the association, and others and hustled into a dozen autos, and in procession passed through the business part of the city and out to Kinnear Park, where some of the beautiful native Madrona trees were seen, and Elliott Bay was viewed, but owing to the forest fires we had to take the local citizens' word for the mountains that lay beyond. Passing through the Queen Ann Hill residence section, where the streets are bordered with mountain ash, the "rowan tree" of the Scotch, we returned to the roof garden of the Washington Hotel and were served with liquid refreshments. Woodland Park, with its good drives and zoo, was next visited; thence to the University grounds and over the winding Interlaken Boulevard to Lake Washington.

Passing through Mount Baker, a residential park, and Volunteer Park we were taken to the Seattle Commercial Club for luncheon, and there, amid rejoicing, we welcomed the missing Haible. At luncheon we were welcomed to Seattle by members of the local committee, which were responded to by members of our party. After a short period of rest we boarded the steamer Mimeapolis for Tacoma. On board the steamer we were met by George A. Hill, Superintendent of Parks at Tacoma, and Mrs. Hill who, acting as a reception committee, escorted us to the city. Arriving there we found autos awaiting us and enjoyed a most interesting ride about the city. Our first stopping point was at the magnificent Stadium, where as many as 50,000 people often Leaving the Stadium we drove southward about twelve miles to Point Defiance Park, and the drive over the splendid. inexpensive, earth-crowned road, was a revelation. One might almost expect at each turn to be held up by a band of Indians, so awe-inspiring was the density of the fir trees, whose bases would require the out-stretched arms of from eight to ten men to encircle.

In a grove of firs by the roadside a delightful picnic supper, prepared on the concrete stoves, was served by several ladies. After our appetites were appeased, we enjoyed the interesting speeches, during which Mr. Allen, of the Tacoma Park Board, brought out the point that he was not afraid that any park superintendent present might copy the plantings in Point Defiance Park with trees almost a thousand years old. A private car of the local street railway carried the party back to the Northern Pacific depot, where our train and baggage awaited us from Seattle.

SUNDAY, August 15. Early in the morning about ten miles out of Portland we crossed the famous Columbia River over trestles two miles in length. Arriving at Portland about 8 o'clock Emil T. Mische and a committee composed of local park people met us and, entering autos, we started out for another day of sight seeing. Proceeding over the boulevard that overlooks the Willamette River we drove through Portland Heights, a fine residential section, and visited the interesting Forestry Building: thence over about ten miles of new roads winding in and out on the mountain side. Crossing the beautiful Willamette River and driving through the St. John's district we next visited Columbia Park, then to Peninsula Park, where the fine sunken rose garden is located. Portland certainly proved her claim to be the "rose city."

Passing through a very attractive residential section we reached Mt. Taber Park, where we were met by Mrs. Baker, wife of the Park Commissioner, who became our hostess for the day. Luncheon was served on the veranda of the Park Lodge overlooking a beautiful view of the city, river and mountains. Luncheon over, we proceeded under the direction of Messrs. Baker and Mische to visit the different parks and playgrounds. Again crossing the river, we drove through an interesting park and fine cemetery, where we recalled the fact that Portland permits no Sunday funerals. Arriving back in the city about 5 o'clock, we were taken to the Chamber of Commerce rooms, and after a rest were served with a most delicious dinner. Portland has the largest Chamber of Commerce in the world, and owns the large office building in which the rooms are located. Following the dinner there were speeches by Messrs. Baker, Mische, Prost, Merkle and McEwen, As we left the dining room each lady was presented with an armful of lovely roses.

MONDAY, August 16. Our first important stop was at Grant's Pass. We soon began to sharply ascend grades, and it was not long before we were in the wonderful Siskiyou Mountains, where we could catch glimpses of the Rouge River valley spread out below us. Early in the afternoon we sighted Mount Shasta and about sunset reached Shasta Springs. It was near here that we began our repeated crossing of the Sacramento River, crossing eighteen times in all. We noted the beautiful Castle Crag, bare rocks that stood on the mountain top like veritable castle towers. While the mountain tops were bare, the railroad itself passed through a wonderfully interesting growth of trees and wild shrubs, a variety of evergreen and deciduous trees and shrubs that we did not know.

TUESDAY, August 17. We awoke early to find ourselves skirting the waters of San Pablo and San Francisco bays for a distance of twenty-five miles, reaching Oakland about 7 o'clock and San Francisco by ferry a balf hour later. A few minutes later we were all comfortably located at the Hotel Stewart, the headquarters of our party in San Francisco.

(To be concluded in November issue.)

## The Drift of Modern Recreation

An advises by Edwin B. (2) Great, D. Get v. of Physica, Tenenten, Nin Francisco - respect for the 17th one content of the American Association of Leek Sugar at notice wat 800 code sectors. Tugast 20, 1918.

You have heard painted descriptions here on problems of several years; however, I doubt if any problem has awakened as much interest as the modern recreation problem, and you find yourselves more and more perplexed with it; the consequence is, if we discuss briefly the drift of this movement, it may

give help to us.

We have had this movement for about 26 years. It started in Boston about twenty-six years ago. For fifteen years we have had a very intensive development of it under different groups; park boards, school boards, playground commissions, etc., and we have seen this intensive development end, and in the last eight years we have had a national propaganda body running over this country, stimulating public education along these lines. Consequently we have spent a vast sum of money, and it means something. We have found a new and easy way to graft, or we are responding to public sentiment. I believe there is a distinct public sentiment for this recreation movement, and that this large, vast expenditure of money for recreation facilities is nothing more or less than a response to a public demand. But this is

a single thing about this movement. We have had it for twenty-five years, and for fifteen years in its intensive development, yet the movement has not been standardized. This is in contrast to the Boy Scout movement. This movement has a definite problem with reference to activities, with reference to activity facilities and leadership.

This playground movement has nothing standardized as to what is necessary, or activities, or supervision of activities. We are all treading air in most of these matters. The only things that has been standardized is the Public Schools Athletic League in most cities. That was standardized almost at the outset in New York City. There was had a definite scheme which applied to boys in the upper grades. The difficulties there were that it was not broad enough.

The Public Schools Athletic League only reaches boys in the upper grades. We propose to reach girls and boys of all ages. We have, however, reached new phases of this movement in recent years.

The dictionaries did not include until quite recently, such phrases as organized recreation, and the like. These are distinctly new phrases which have come with this movement. The whole business may be

likened to the rising sun at the Exposition. There are two companion pieces in one of the courts. A young man standing on tip-toe with his head elevated, aspiration all over his form and the young lady opposite, representing the setting sun. It sems to me this recreation movement is represented by this beautiful statuary. Whether we will ever do anything very serious about it remains to be seen, but nevertheless since it has so much back of it, of public sentiment, we must meet it, and we can treat as the old Methodist preacher was inclined to treat a certain situation: The people had come into his church to discuss a neighborhood problem and they discussed it pro and con, and the old preacher stood up and said: "Ladies and gentlemen, these are serious problems. We must meet them. Having met them, let us pass on."

We cannot meet these recreation problems in this manner. We must supply playgrounds or stand out

boldly against them.

How have we treated this idea? This public recreation movement? We have supplied large areas, usually quite adequate areas for play, they have been pretty well kept, as a rule; the surfacing has been pleasing and altogether it has lent itself to play. Then the parks have supplied a great quantity of apparatus, much more than the playgrounds under other groups; perhaps, altogether, too much apparatus. Nevertheless, there has been this adequate supply of apparatus of all descriptions. Then we have worked the playground movement out in the parks in a very inclusive manner.

It has served the little children as well as the very mature people. The idea of a park man seems to be to supply every facility needed by everyone. Therefore, we have in the parks a more or less ideal equipment of, satisfactory equipment, to the community.

What more do we need in the parks? What more has been demanded which they have not supplied? It is this bugbear of supervision. It is claimed that park supervision is not adequate. In the parks there has been either police or attendant supervision, and so forth, and almost never the trained supervisor; so it seems to me there is one place where the park man is having trouble, and will continue to have it until the

supervision is met.

What is meant by that? Let me say I believe it is not a myth; that there is something real about it; that it means, in its essence, that the parents who send their children to the playground, want these children to come into contact with a superior person, whose manners and language are right; with a person who can shape the ideals and aspirations of these children; not some one who is to patronize and knock them about roughly. They want some one akin to the teachers of the class room. All education is not found in the class-room, but some in leisure time, and the humblest parents want their children to come in contact with a superior person in a playground as a leader than in the classroom, because in the class-room you are engaged in your studies, but in the playgrounds they are engaged in activity, and children live in activity, and consequently the play should shape the ideals, manners and morals of the children and this found in the playground and not in the class-room, always. Consequently there is something quite fundamental in this demand for supervision, and the people who have made serious study of it, say this: That the parks have for many years furnished these splendid facilities which have given us splendid satisfaction, but in this intensive work, they have not given this supervision. "More than this," they say, "gambling goes on in the parks."

The laws prohibit gambling, yet it goes on quite openly in the handball courts, and things of that sort, in many of the parks, and most everything is played for a jackpot or a stake, and it is a question whether our great national game is building up character or building up a bunch of gamblers. Then again the parks of many large cities show an undue amount of immorality. People go there for recreation. Well, of course holding hands is recreation, but beyond that, is immorality, and the public parks have become the stamping ground for immorality, and people have said that the parks have not taken hold of the matter as they should.

Then, when the park board people say: "We shall attempt to supervise these playgrounds," they are at a loss to find these superior people to place in these parks. They cannot seem to find them. The salaries are quite low; there have been no training schools until quite recently, and those have been quite inadequate; consequently it is very difficult to find trained supervisors, and so the park man is in the position of the little boy who was weeding the garden. A neighbor poked his head over the fence and said to him, "Little Boy, how much do you get for weeding that garden?" The little fellow replied, as he straightened up and put his hand on his back, "Nothing if I do, and the devil if I don't."

So the park man gets nothing if he does have this supervision, and the devil if he does not. So the difficulty is in finding these superior leaders of play.

Much is to be said about supervising play. Many of us say "We were not taught to play." "Look at us, good strong, husky fellows with good morals. We didn't have this paly supervision; we were not taught to play. Why should the children of today have to have it?"

The conditions have changed very radically. Moreover, we cannot tell but what we might have been governors or presidents, if we had superior play leadership. I think I can give way to no man in the utter play that I had, but I wish I had had some one at the old swimming hole, at the wrestling match, at the boxing match, and those affairs, which are incorporated today in much of a modern recreation movement. It would have been a great pleasure to me at that time and it would be a great pleasure for me to look back on that experience now.

It does not mean play bossing, but simply interpretation of play life. We very often interpret a book to a boy or a girl so that they can get more pleasure out of that book—get richer values. Then the educators have discovered great possibilities in well directed play. Many lessons can be taught in play that cannot

be taught in the class-room.

What have the schools done with this problem? The parks ought to be given the greatest amount of credit for controlling and leading this modern movement. Their record is fine in that respect. The record of the school is not so good. They have supplied playgrounds where, if the children attempt to play they fall down and cut their hands and knees on the ugly cinders in the school vards and the hard pavements. It is no wonder the children rush out to the street to play, rather than linger in the school yards. schools have fallen down in the playground. Then, the equipment has been of a very poor type, not placed there with any great amount of study. Then again, the playgrounds of the schools have always been operated on a very short period of time. For instance, when the summer vacation comes, the board says, "We will have six weeks of playground work in the school

yard." At the end of six weeks, when the children are really getting some fun out of it, then the playground is closed. Then, too, they are closed very early in the afternoon, if they are operated at all in the afternoon, so the schools have not done very much with playgrounds. I shall say something more about this in just a moment.

Notwithstanding the fact that park and school boards have taken hold of this, they have in certain communities organized playground commissions. Why should we develop a new body, when we have groups whose function it is to do something along these lines—in other words, to cover the ground, if need be.

The Park and School Boards have complained of insufficient funds; therefore, we have created a new body. These, then, have supplemented the park and school boards again, in our municipal government, there is always a welcome to a new body. It means officers, positions, patronage, etc. But we have added to the tax and multiplied municipal machinery. There has been a great deal of duplication in this sense. And these playground commisssioners have not offered anything superior to what has been offered by the school or park boards of those who have gone into this with earnestness. The Park Board is attached to the community; the school board is attached to any settled function of the community, and consequently the playground commission is one of the weakest organizations handling this public recreation movement, notwithstanding the fact of brilliant examples here and there on the part of such commissions.

It seems to me this is the drift: The park boards are seeing, and the park superintendents the same, that they have been too willing to buy every piece of apparatus that came along, exploited by some man. They have been too willing to put in this apparatus. This movement does not aim to give the leap for life or the jump from the heavens or some place else, and yet these people are always coming to the park board to sell this apparatus. It usually has great possibilities for accident, no possibilities for building and developing the physique, developing the will power. school courage or any of those other rich attributes which could come from the use of this apparatus in play, but it is most stimulating. It attracts the crowds. Of course the children rally there and hang around it all day because of this great amusement. They would follow the "Black Mariah" any time an arrest was made because it is spectacular.

It seems to me the park boards are traveling the wrong line, there and that the boards are seeing, and the superintendents are seeing, and they are regarding with suspicion the man who comes to sell them these wonderful devices.

(To be continued in November issue.)

#### PROPAGATION OF HEATHS BY CUTTING.

The Heath or Erica family is a fairly large one, and consists of both hardy and greenhouse plants. They differ widely in their habit of growth, ranging in height from about 9 inches to 6 feet or more. The various species and varieties blossom at different seasons, no period of the year being without its flowering Heath. Many gardeners are under the impression that cuttings of both greenhouse and hardy Heaths are difficult to root. This, however, is quite a mistage; the cuttings root very easily, provided one or two very simple rules are followed. No season of the whole year is better than August and early September to insert the cuttings. At this time there are plenty of

half-ripened young shoots on the plants, which make excellent cuttings.

As comparatively little depth of soil is necessary for Erica cuttings, the pots should be filled at least half full of broken crocks or other suitable material at hand for drainage. Over this place a layer of rough peat or moss to prevent the fine soil trickling down between the crocks and preventing the free passage of water. A suitable compost in which to root the cuttings consists of two-thirds peat, passed through a quarter-inch mesh sieve, and one-third sand. Fill up the remaining space in the pots with this material, press firmly, and leave the surface of the soil a quarter of an inch below the top of the pot to permit of a little fine sand being sprinkled over the surface and to allow space for watering. Water each pot well as soon as filled and leave it long enough to drain thoroughly previous to inserting the cuttings. The most serviceable sized pots to use are those known as 5-inch size. These are convenient to handle, and are just wide enough to take a 4-inch bell-glass.

The largest percentage of successes may be expected when cuttings of medium growth are inserted. In most instances the side shoots growing on the strong, vigorous young growths will be found to answer this description. Thin, weak cuttings, though they will root, seldom grow away kindly and make good, sturdy plants, while many of the thicker, sappy growths would damp if inserted as cuttings. An inch to 11/2 inches, not longer, is a good average length for a Heath cutting. Many of the side shoots will be found about this length, and if removed carefully with a slight downward pull will come away from the main stem readily and have a nice heel at the base. Failing this, the shoots must be cut off just below the leaves at a joint. The bottom leaves must be carefully removed.

The cuttings may be inserted moderately close together. A 5-inch pot will accommodate from thirty to three dozen cuttings. Place a layer of fine sand over the surface of the pot, take a small pointed stick (dibber) in the right hand and a cutting in the left. Make a hole with the dibber, and as it is drawn out insert the cutting, and allow the sand to trickle in and fill up the hole. Press the cutting in firmly with the other (thick) end of the dibber. Water the cuttings with a fine rose on the spout of the watering-can, and allow the pot to drain for a few minutes before placing on the bell-glass. Should a propagating-frame with just a little bottom-heat be available, the pots may be plunged in this. Failing this, place the pots under a hand-light in the shadiest part of the greenhouse or in a cold frame. Wherever they are placed, shade the cuttings from sunlight.

Every morning the bell-glasses should be removed and any moisture collected on the inside wiped off with a cloth. Water the cuttings when dry with a rose on the watering-pot, and remove any damp or yellow leaves if present. The young cuttings will root in from two to three months, when it will be necessary to gradually admit air, this being done, to start with, by tilting the bell-glasses before removing them entirely. When growing freely the tips of the shoots should be removed, to induce the plants to make several shoots each and form nice little bushy plants by next May. These young plants, if of a greenhouse variety, should be potted off singly in small pots, or, if belonging to the hardy section, planted out 4 inches apart on a prepared border outside, from where, in the following autumn, they can be transferred to the positions for flowering. Gardenin

#### PROTECTING BIRDS IN PUBLIC PARKS.

By J. S. Foster,<sup>2</sup> Illinois.

Some years ago an exceedingly well informed gentleman, whose name I do not recall at this time, was touring the country as a representative of Miss Anna Gould in her effort to increase people's interest in birds. He visited us and gave us valuable information in the matter of attracting and caring for birds in the public parks. We followed his suggestions and advice as far as possible, feeding and providing nesting boxes for various kinds of birds, and can say that it is surprising how many varieties of birds can be located by nature lovers in some of the parks.

From time to time other naturalists and bird lovers have given us valuable suggestions on this subject; among these may be mentioned Mr. J. R. Griffith and Jack Fulton, Jr., both of whom are well posted and very enthusiastic advocates for the protection of wild birds. The latter found 114 different kinds of birds or water-fowl in Jackson Park between March 1 and May 20 in 1914. A list of these is given further on in this letter.

At various places throughout the park system signs have been posted requesting the public to co-operate with the South Park commissioners by not molesting the birds. Food is supplied to the birds during the Fall, Winter and early Spring. This consists of a mixture of various kinds of seeds, including in some cases also ground break and meat. The mixture is made up of the following:

Hemp seed	200 lbs.
Millet seed	
Sunflower seed	100 "
Mixed chicken feed	
Oats	

In the larger parks where the mixture is fed rapidly enough to prevent the ground meat from spoiling, the following articles are added to the above mixture:

Ground	beef			 					 	20	lbs.
Ground	beef	suet.	 	 						10	4.6
Ground	stale	bread	 		 					 6	loaves.

At various places in the shrubbery in Washington and Jackson parks feeding platforms elevated about six feet above the ground on single iron pipe standards, and covered by thatched roofs, are located, on which the feeding mixture is placed daily during the seasons previously mentioned. The feed is also scattered in sheltered places on the ground, where it is readily found by the birds.

Quite a number of small suet "cages," each holding several pounds of ground suet and made to fit around the trunks of trees, have within the last year or two been hung here and there in the two larger parks in an effort to hold over Winter the kinds of birds which relish that food.

In early Spring, nesting material, mostly in the form of loose waste, is hung at different places in the shrubbery, where the birds are apt to find it easily.

Several sizes of bird boxes have been placed in trees of different parks, and the shelter afforded by them has undoubtedly contributed towards inducing the birds to make their homes there. In addition to these, martin-houses, providing for several hundred birds, are placed on the tops of tall posts in Washington and Jackson parks, and every year colonies of martins take up their residence in them. These martin-houses are closed in the Fall after the martins leave so as to prevent the sparrows from taking possession of them. Just before it is time for the martins to arrive in the spring all of the houses are opened again. The posts supporting the martin-houses are covered a part of their length with tin to prevent cats or squirrels from climbing them.

As many varieties of birds are quite shy and rarely come out from their retreats in the shrubbery, the general public is undoubtedly not aware of their presence, and they are seen as a rule only by those close observers who delight in seeking them. The Wooded Island in Jackson Park, surrounded as it is on all sides by water and with plenty of shrubbery and trees seems to be a favorite resort for the birds. It was on this island that Jack Fulton, Jr., found most of the birds in his list, which follows. This covers only such varieties as he found up to May 20th, and all were seen in Jackson Park

Care has been exercised in selecting for plantation many shrubs having berries of different sorts furnishing the birds with considerable food during most of the year and many birds are very likely attracted to the parks through them.

The benefits derived from the presence of insect eating birds in the parks as an assistance towards protecting trees and bushes from the ravages of harmful insects is very great. There is no doubt but what the effort made by the Park Commissioners to attract birds to come and stay in the parks has resulted in a very great increase in the interest in birds shown by the people visiting the parks.

## CULTURE OF THE EXHIBITION CHRYSANTHEMUM.

By Ernis, Romsson, Conviction.

I will endeavor to give you, as near as I can, a talk on this subject, touching on the chief cultural details, in the production of the large blooms of today. I am often asked the question, "What bud would you take such a variety on, and on what date"? "What is your opinion of such a variety"?

In the first place it must be understood that one cannot be governed by any hard and fast rule, as there are no two conditions alike, such as soils, housing, and different localities. The only way to ascertain just what varieties will do in your locality and under your conditions, is to try out a number of varieties, and treat them in different ways. This will take a season of experiments to prove just what varieties are suitable, and prove satisfactory.

I have adopted this method, and find I have been well paid for my trouble. You can be governed by acting on the advice, given by the Mum Specialists in their lists to a certain extent, as they give a fairly good idea just what bud is necessary.

Procure some good, turfy sod, three to four inches thick, and stack, grass down, putting a good layer of cow manure between the layers of sod. This, of course, is better done a year ahead, to allow the compost to be half decayed, thus doing away with all weeds, etc. The chrysanthemum likes a fairly good, heavy loam, but must be fibrous, and well drained, to keep the soil sweet.

After plants have done flowering, cut down close, and give them a few weeks' rest. But do not dry off entirely. It is well to bear in mind that this stock is the foundation of your success the following year, therefore, give them good quarters in a temperature of 40 degrees, well up to the light, and always be on the lookout for any pests, which are liable to cripple the young cuttings. One month before you intend to take your first batch of cuttings, raise your temperature to 45-50 degrees, and give them a more liberal supply of water.

Select only the healthy cuttings of each variety, and make cuttings about three inches long, not over, be sure to use a sharp knife, and take out bottom eye without injuring the base. This, I think, is very rarely carried out, even with some of our exhibitors. It does away with that bunch of rootlets, which, in some cases, fills up your pots with useless material, thus taking most of the nourishment there is in the soil. Insert cuttings in sand in some shady corner of the house, and do not keep close. A temperature of 50 degrees, without bottom heat, is all that they require. Keep young stock sprayed over, but be sure they are dry at night. Shade, if necessary, from the sun. Pot up when rooted singly in 21/2-inch pots, in a compost consisting of 3/3 loam and 1/3 leaf mold, and a dash of sand. Do not apply any fertilizer in soil at this stage. Shade from the sun a few days, and keep a little overhead moisture about as before, then give them all the light obtainable, and a little more room, as they develop into nice, stocky plants. Air according to weather, and do not allow any draughts to strike them. When they have well filled the pots with roots (not to become pot-bound), give them a move into four-inch

Do not pot deep, as the roots will readily enough find

Society. Continued on page 400.)

#### THINGS AND THOUGHTS OF THE GARDEN.

(Continued from page 442.)

New York is lamentably deficient in these indoor horticultural attractions. In visiting the garden one day recently, I was amused to notice how the naming here differs from what is generally current, or what one will find at the Brooklyn Botanical Garden, for instance. Each of these gardens are under public control, and at least they are both in Greater New York in the same town, so to speak, but at different ends of it. Why, then, should there not be uniformity in the nomenclature? Here are some examples I made note of in a very short stroll, without searching for these differences

Spiraea Lindleyana labeled Schizonotus Lindleyana. Funkia subcordata grandiflora labeled Niobe plantaginea.

Funkias all named Niobe.

Cuphea ignea labeled Parsonia ignea.

Liatris species labeled Lacinaria.

Euphorbia corollata labeled Dicrophyllum margina-

Vinca roseus-oculata labeled Ammocalis roseusoculata.

Botanists are notorious for the changing of names, "Just to justify their existence," as some of the laity perhaps rather unkindly has said. But we of the humble gardening fraternity, and especially the florist and nurseryman, surely deserve more consideration than the systematists have so far exhibited. We use plant names as much as they, and we are as a thousand to one of the scientific botanists. Protests have not been wanting, but so far have been in vain. One gets the impression that the man of the microscope and vasculum looks upon the horticulturist as an inferior creature to himself, and has seldom or never tried to explain or justify the changing of old established names, so far as my observation has extended. I believe that quite a number of the changes are made in accordance with the international rule of priority. Under this rule, or by virtue of it, if a botanist, be he ever so young or indistinguished, finds in his researches that some earlier botanist had given a name to a plant which, we will say, is at present known as Lasiandra, and that the earlier name was Tibouchina, he at once sets about "correcting" the matter, and out comes Tibouchina for us all to learn and remember. As all good gardeners like to keep abreast of progress, the new name is mentally noted, and if one converses with a really intelligent fellow craftsman, most likely the new name will be the one mentioned, usually with the remark that the old name has been dropped. But when, a short time later, one finds still another name substituted for Tibouchina, the name this time being Pleroma, our faith in the skilful research and care of the botanists receives a jolt, and, to say the least, the mere gardener gets a bit tired. This is an actual instance of the last few years. Nothing is sacred to the re-novating hand of Mr. Botanist. Even our old friend the Boston Ivy or Ampelopsis Veitchii, which most of us also know is called Vitis inconstans, thus classing it with the Grape vine family, where one would say it very reasonably belongs, has been rebaptized, and now bears the euphonious title, Parthenocissus quinquefolia. In regard to all this, will the botanists deny that they have made changes far too hurriedly in some instances; will they deny that they have seized on hairsplitting differences many, many times; and will they deny the futility of these changes so far as the general

adoption of them is to be considered? Had I taken due note of all I have seen, heard and read of in regard to the changing of names in the last fifteen or twenty years some curious things would have to be recorded, not all of them flattering to the herbarium fellows. But after all we're only gardeners and don't under-

The new Pelargonium Clorinda, which many might simply call a Geranium, is another of those plants that have taken far too long to become generally known and grown. Notwithstanding all the advertising that both Chas. H. Totty and the Messrs. Vincent gave to this fine plant some time ago, its great merits have been largely overlooked. Many will also remember the plants of it that were shown at New York spring show by Mr. Lewis and others. These were very fine indeed, yet they merely outlined, as it were, the possibilities. Some years ago I saw Pelargonium Clorinda shown as a standard, three feet or more in height, with an umbrella head. The plants were only in ten-inch pots, but bearing, as they did, a perfect crown of pink trusses, their beauty, combined with the delightfully scented leaves, can well be imagined. It is just one of the easily grown, free flowering plants that we all ought to have, and when we have it we should grow it to the highest perfection.

#### CULTURE OF THE EXHIBITION CHRYSANTHEMUM.

(Continued from page 465.)

their way to the drainage, which has to be avoided. According to the value of your compost, one must be governed accordingly in the use of commercial fertilizers, and the mistake is often made in using them to excess. Thus causing gross, sappy growth, resulting in the blooms damping, and in some varieties the buds will not develop. Although most exhibition growers are prepared to lose at least 20 per cent. of their blooms through high feeding.

In taking the buds, no hard and fast rule can be applied, as some varieties are apt to act differently in certain localities. Experience, as I have already stated, is the best teacher in this respect. In some varieties, they will show bud in their 4-in. pots. This, to some extent, is caused by taking stem cuttings and tops, which is not practicable. Disbudding must be carried out during their growing period, and should never be neglected. Buds should be taken from August 1st to 7th day of September, according to location and variety. I have always found that in late varieties buds taken the latter part of August are the most satisfac-

One must always be on the lookout for black and green flies, which secrete themselves in the tips of the young growth; also numerous other pests. To combat these, a spraying of Aphine weekly, getting well under the foliage, and in the points, is a sure remedy, and a good preventative. Red spider is one of the worst enemies, but by keeping the house as cool as possible during the summer months and a good pressure of water several times during hot days, is the best prevention. A weak solution of soot water sprayed through the plants is beneficial. Mildew is likely to appear later on in the year, when the nights get cooler, and they are subjected to draughts. A spraying or two of Fungine will soon rid them of this. As soon as the color shows in the bud. the house must be kept dryer, spraying discontinued, and such varieties which bleach with the sun, should be shaded.

and Mr. George Hastings to associate membership.

The exhibition tables were well filled with fruit, flowers and vegetables. president appointed Messrs, Gale, Duckham and Ford, who turned in the following report, which was read and accepted: Society's prize, 6 tomatoes, Chas. Milburn; society's prize, 12 dahlias, James Duthie; society's prize, 6 apples, James Duthie; dahlias, honorable mention, John Sorosick; dahlias, Jos. Robinson, honorable mention; 2 vases antirrhinum, Chas. Milburn, thanks of society; vase of marigold, Chas. Milburn, honorable mention; 18 varieties roses, David Hothersall, cultural certificate; vase of gladiolus, Alfred Walker, honorable mention; celery, A. Yanuchi, honorable mention.

Prizes weer received from I. Hicks & Son, Frost & Bartlett Co., Vaughan's Seed Store. Exhibits for next meeting will be 3 chrysanthemums, one variety, 2 cauliflower, 3 celery.

The Dahlia Show to be held on October 5 and 6 bids fair to be the best in the history of the society. Schedules for the Dahlia and Chrysanthemum Shows to be held on November 2 are now ready.

A. R. KENNEDY, Secretary.

#### MENLO PARK (CAL.) HORTICULTURAL SOCIETY.

In the absence of the president the meeting was called to order by Vice-president Slade. There were thirty members present.

There were only three exhibits in the monthly competition, which was the smallest number since the competition started. G. Nunn secured 79 points for Lilium Speciosium Rubrum; D. Slade 76 points for tomatoes, and D. Bassett 80 points for a display of sweet peas. Mr. Bassett had been picking from the vines since early in May. They are grown on the single stem system. and had reached the top of 10-foot bamboo canes, were tied down and almost reached the top again, making a growth of almost 20 feet. Mr. Bassett won the championship of California shield at the Exposition sweet pea show last June with peas picked from the same vines. Several of our members have become very enthusiastic over sweet peas, and great things are predicted next year.

Special prizes donated for the fall show were as follows: C. C. Morse & Co., \$25; Halliwell Seed Co., silver cup; Lynch Nursery Company, gold medal; Hawaiian Fertilizer Company, one-quarter ton high grade fertilizer; Aphine Manufacturing Company, silver and glass flower vase, and the Na tional Association of Gardeners, medal. We have promises of several others. Everything looks like the most successful show we have ever held.

Great disappointment was felt by the members in not being able to have the pleasure of entertaining the visiting members of the N. A. of G. to a barbecue and an automobile trip around some of the principal private estates at Menlo. But the attractions were so numerous at the Exposition, and the time so short, that the few members who made the trip had to decline the invitation.

A communication from Co-operative Committee N. A. of G. suggesting the free transfer of members in good standing from one horticultural society to another was very favorably received and endorsed by the members

H. Halliwell, of Halliwell Seed Company,

was elected to active membership.
PERCY ELLINGS. Secretary.

#### NASSAU COUNTY HORTICULTURAL SOCIETY.

The Annual Dahlia Show of the Nassau County Horticultural Society was held in Pembroke Hall, Glen Cove, Thursday, October 7. Some very fine exhibits were staged and competition in the different classes was very keen. Following is a list of different classes and winners: Dahlias, Harry A. Drew Special, 1st, Mrs. W. J. Matheson, Huntington (gardener, J. Kirby); 2nd, Mrs. H. I. Pratt (gardener, F. O. Johnston). Ernest J. Brown Special peony flowered dahlias, 4 varieties: 1st, Mrs. H. Darlington, Mamaroneck (P. W. Popp, gardener); 2nd, Mrs. H. I. Pratt. Twelve cactus: 1st, Mrs. W. J. Matheson; 2nd, Mrs. Darlington. Twelve decorative: 1st, Mrs. Darlington; 2nd, Mrs. Matheson. Vase of singles: 1st, Mrs. Darlington; 2nd, Mrs. Brewster, Glen Cove (gardener, Harry Goodband). Twelve decorative: 1st, Mrs. Darlington; 2nd, A. Golon. Six peony flowered: 1st, Mrs. F. S. Smithers (gardener, V. Cleres); 2nd, Mrs. C. D. Smithers, Glen Cove (gardener, P. Chabon-Six cactus, long stems: 1st, Mrs. F. S. Smithers; 2nd, Mrs. H. I. Pratt. cactus: 1st, F. W. Woolworth (gardener W. D. Robertson). Decorative vase: 1st, Mrs. F. S. Smithers; 2nd, J. B. Taylor (gardener, G. Wilson). Vase of show: 1st, Mrs. F. S. Smithers; 2nd, J. B. Taylor. Twelve any type: 1st, Mrs. F. S. Smithers; 2nd. Mrs. F. S. Smithers.

Roses-Mrs. E. M. Townsend Special: 1st, T. Pratt (gardener, J. W. Everitt). W. R. Kinnear Special: 1st, Mrs. Smithers; 2nd, Dr. Ayres, Glen Cove (gardener, H. Jones). Twelve outdoor roses: 1st, Mrs. F. S. Smithers; 2nd, Mrs. H. I. Pratt. Outdoor flowers, best collection not more than 25 species: 1st, Mrs. G. D. Pratt (gardener, J. F. Johnston); 2nd, J. W. Woolworth. Vase of hard aster: 1st, Mrs. J. Otley.

Vegetables-Stump & Walter Special, 12 varieties: 1st, W. R. Coe, Oyster Bay (gardener, J. Robinson). Six varieties: 1st, Mrs. Otley; 2nd, J. B. Taylor; 3rd, E. Kimball. Nine varieties: 1st, Mrs. H. L. Pratt (gardener, H. Gault); 2nd, W. R. Coe.

Collection of outdoor fruit-lst, Mrs. H. I. Pratt.

The class for table decoration brought out some strong competition, there being 8 entries, 1st prize being awarded to R. Jones;

2nd, to J. Adler; 3rd, to H. Jones.

Judges were Messrs. James Bell, Thos. Griffin and William Vert.

JAMES GLADSTONE, Corresponding Secretary.

#### MAPLEWOOD (N. J.) DAHLIA SHOW.

The first annual dahlia show, under the auspices of the Maplewood Dahlia Society, proved a gratifying success to those who had the affair in charge. The society has decided to make the show an annual event. The question of holding a rose show in the spring is also discussed.

There was a large attendance both afternoon and evening. The judges had a task in deciding the winners, because of the excellence of the different displays. judges included William Reid, of Orange; John Garvin, of West Orange, and Deitrich Kindscraft, of Orange.

The winners were:

Twelve dahlias, four varieties. First, Mrs. John R. Le Count; second, Frank E. Taylor. Best six show dahlias, in three varieties. First, George H. Stevenson; second, Walter

#### SHORT HILLS, N. J., DAHLIA SHOW.

Dahlias in large numbers and many varicties were exhibited at the annual show of the Short Hills Garden Club at the Short Hills Club, Short Hills, N. J., September 28

Amateur exhibitors only are eligible to compete for the prizes, but there were several professional exhibits. A luncheon was served at the club at noon by the Short Hills organization to visiting garden club members from Princeton, Madison, Bernardsville, Trenton, Tuxedo, N. Y., and other places, who numbered about 100.

The judges were Mrs. T. Henry Dixon, Philadelphia; Miss Anne McIlvaine, Tren ton, and Arthur Herrington, Madison.

Following is the list of classes and prize winners:

Cactus dahlias. First, Mrs. Edward G. Layng; second, Mrs. Lang; third, Mrs. John A. Stewart, Jr. Decorative table. First, Mrs. William K. Wallbridge; second, Mrs. Will Bradley; third, Mrs. Walter Lawrence.

#### THE CLEVELAND FLOWER SHOW.

Everybody is talking of Cleveland at this time, because of the nearness of the big Flower show, that has probably received more advance publicity than any similar event held in an inland city heretofore.

The various committees have done strenuous work since the 1st of March, and, according to all indications. the outlook for the success of this event, under the auspices of the Ohio Horticultural Society, the Cleveland Florists' Club and the Garden Club of Cleveland, is very

The annual meeting of the Chrysanthemum Society

of American will be held on Thursday, November 11. Friday, November 12, will be the Fall meeting of the American Rose Society, and also an executive committee meeting of the American Carnation Society will take place.

The committee has obtained the consent of several large growers to have new plants named at the show. One of these will be a new Dixon rose, grown in this country by Chas. Totty, also several new Totty chrysanthenums, and a number of chrysanthenums grown by Elmer D. Smith, of Adrian, Mich., and E. G. Hill Co., of Richmond, Ind. They will adopt some novel methods for choosing suitable names for these new blooms.

Those intending to take the trip in the east should get in touch with Mr. John Young, secretary of the New

York Florists' Club, or Chas. Henry Fox, of Philadelphia, and Henry Penn, of Boston, as special parties are being formed from these points.

The Cleveland Flower show will be well worth seeing, and we urge a large attendance of superintendents and gardeners of eastern private estates, as it will enable them to inspect some of the model places in the suburbs of the Sixth City.

#### CHRYSANTHEMUM SHOW IN EXPOSITION.

The first of a series of monthly flower shows and lectures on the subject of the cultivation of flowers will be held at the Country Life Permanent Exposition, Grand Central Terminal Building, New York City, on November 1-2.

The first show will consist of a chrysanthemum exhibit. Charles H. Totty, of Madison, N. J., recognized as one of the foremost authorities in this country on chrysanthemum growing, will deliver a lecture on the first day, Monday, November 1, on "The Cultivation of Hardy Chrysanthemums."

Suitable prizes will be offered to private and amateur gardeners in competition. Trade exhibits will be invited, but not for competition. An invitation is extended to all garden lovers to attend the show and lecture, to which there will be no charge.

#### THE MODERN GLADIOLUS GROWER

Published monthly in the interests of both amateur and professional flower growers.

50c. per year-3 years for \$1.00

The Gladiolus as a flower has been wonderfully improved and is rapidly becoming the fashion. Important developments are looked for in the immediate future.

Madison Cooper, Publisher, Calcium, N. Y.

SOME time ago we were awarded a contract to build the Greenhouse shown above on the right, which then adjoined two smaller ones. After comparing the results in the three, we were ordered to tear down the old ones and replace them with another of ours—that's the one on the left.

Had the original houses been properly designed and properly constructed they would not have been doomed to the scrap heap.

In the selection of a Greenhouse Builder an Owner must use discrimination or take the consequences.

Under these circumstances, why take chances? We design and build them right in the first place.

#### Put Your Greenhouse Problems Up To Us.

fences are made of big, strong wires with clamped joints which prevent slipping, sagging or twisting. This exclusive feature assures unusual rigidity under the most severe strain. Excelsior Fences are dipped in molten zinc which makes them practically indestructible. Write for Catalog J from which to select the style best suited to your needs. Ask your hardware dealer for Excelsior "Rust Proof" Trellises, Flower and Tree Guards.

WRIGHT WIRE COMPANY, Worcester, Mass.

## The Dangers in Using Unprepared Humus

NMODIFIED" or "unprepared humus" is nothing but water-logged, sour swamp muck. Its use increases the acidity of the soil, endangering the destruction of the bacteria, so absolutely essential to all soil fertility. No plant foods are added to make it a balanced soil enrichment.

Altho sold from dry samples, it generally comes to you in its original water-logged condition, making an expensive way to buy water.

Contrast it with the sweet, dry, granulated, rich Alphano with its record of wonderful successes.

Our Convincement Book tells the complete story. Send for it.

Alphano Humus Co.

# When it comes to Greenhouses Come to

Hitchings & Company

General Offices and Factory-ELIZABETH, N. J.

New York

oston Federal St Philadelphia 40 S. 15th St. Science is teaching that it is as essential to

# PROTECT PLANT LIFE

from insect pests and the various fungi with which it is afflicted as it is to properly fertilize it. The importance of this to successful cultivation is becoming more and more evident as more is learned about the growth and habits of vegetation.

a concentrated liquid spraying material, readily soluble in water, is used at various strengths, according to directions on cans.

Aphine is equally effective in the house and garden; free from disagreeable odors of most insecticides, and practical for professional and amateur growers.

It is effective against green, black and white fly, red spider, thrips, mealy bug, soft scale, rose cabbage and currant slugs, and other soft bodied and sap-sucking insects. It can be applied to the tenderest foliage, flowers, fruits and vegetables.

Aphine will keep your plants (sweet pea vines, rose bushes,

etc., etc.) in the garden free from insects.

Aphine is used by prominent growers as a wash for decorative stock.

Gill, 25c.; half pint, 40c.; pint, 65c.; quart, \$1.00; gallon, \$2.50.

is an oil and sulphur composition—three in one, a scalicide, insecticide, and fungicide combined, composed of a high grade of petroleum, and the properties of the well known fungicide, Fungine. It is a most efficient winter spraying material for San Jose and other scale.

Use one part Scaline to twenty parts water.

As a summer spray for hardy trees, shrubs and plants it is an effective remedy against green, black and white fly, red spider, thrips, woolly aphis, cottony maple scale, tulip scale, mealy bug, and all soft scale. Use one part Scaline to forty to fifty parts water.

The sulphur contained in Scaline makes it an excellent preventive against various fungi at all

seasons of the year.

Scaline will rid your evergreens and shrubs of the red spider pest, which has done so much

havoc to them recently.

For summer spraying, Scaline is recognized as a marked improvement over the old-fashioned kerosene emulsion; more effective and more economical. It mixes readily with water, contains no sediment, and can be applied with the finest spray nozzle.

Quart, 75c.; gallon, \$1.50; 10 gallons, \$10.00.

is a concentrated sulphur composition, used as a spraying material, readily soluble in water, containing no sediment, and, unlike Bordeaux mixture, and lime and sulphur, does

not stain the foliage, but cleanses it.

It is an infallible remedy for mildew, rust and wilt, affecting flowers, fruits and vegetables, and is used with much success by leading growers on young stock as a preventive against various blights; also against bench fungi. One gallon makes 50 gallons spraying material.

Half pint, 30c.; pint, 50c.; quart, 75c.; gallon, \$2.00.

is a soil sterilizer and vermicide. Destroys cut, wire, eel and grub worms, maggots, root lice and ants. Used one part to four hundred parts water, thoroughly soaking the

ground, it will protect your plants and lawns against ravages under the soil.

Gill, 25c.; half pint, 40c.; pints, 65c.; quart, \$1.00; gallon, \$3.00.

These products have the endorsement of leading commercial and private growers, and are generally recognized as standard remedies for the control of the insects and plant diseases for which they are recommended.

For sale by the leading seedsmen throughout the country. If not obtainable in your community, send us your order direct and we will have it shipped to you from our nearest agency.

# Things and Thoughts of the Garden

By The Onlooker.

Although it is rather late to be choosing Narcissi for potting up, it is nevertheless not too late. Some of the best are often overlooked, and the names of a few may therefore not come amiss. We all grow the old Emperor and Empress as a matter of course. Victoria, too, is generally to be found in the collections, also Barrii Conspicuus, than which I think there are few more beautiful Narcissi in commerce. If it has a superior in its own line of red-cup and vellow perianth, this is found in Gloria Mundi. Then who could be without the ancient but ever-reliable Sir Watkin?—one of the oldest Daffodils in all the lists. In recent years the golden trumpet, King Alfred, has come into merited prominence. It is a vigorous grower and is one of the most stately varieties that can be had. As a "white" companion, take Madame de Graaff. Later in point of age came Mrs. Geo. Barr and Mrs. Robt. Sydenham, and each are first-class white self Daffodils. In the chastely beautiful Chalice-cupped Narcissi (Leedsii group) are Evangeline and White Lady; and in addition may be chosen Seagull. Lucifer, Firebrand, Lady Margaret Boscawen, Whitewell and Blackwell are of the incomparable section and are bright and always do well. The chief favorites in the poetaz class are Elvira and Jaune à Merveille; while of the true poeticus varieties three good ones are Cassandra, Homer and Horace. As in the case of Orchids, America is ages behind Europe in its Daffodils and Narcissi. Not a note or a chapter but a book could be written upon the merits, interest, loveliness and idiocyncrasies of the hundred and one varieties of choice Narcissi now obtainable, and as some of the European firms might show an inclination to part more readily with some of their gems this year, it is sincerely to be hoped that some of our wealthy amateurs will have added considerably to their previous collections and exhibit them at some of the leading shows, and in that way prove to others what wonderful grace and refinement of beauty there are in this family of bulbs. In concluding this paragraph I feel impelled to ask why is it that so many growers persist in calling the common Daffodil by the name Jonquil? The Jonquil is perfectly distinct, and how the confusion arose is hard to understand. By the way, it has become the rule to speak of all Narcissi as Daffodils, although formerly that term was reserved only for the long trumpet kinds. It is better, too, as it obviates a lot of difficulty and confusion, especially in these days when even the keenest

specialists don't always know just into what class to place their blooms without first measuring the crown or trumpet with a tape or rule!

There are two plants that the present writer cannot understand being neglected: one is the Australian composite—although very unlike a composite—Humea elegans; the other is the so-called Potato-Cherry, better known elsewhere as the Winter Cherry or Chinese Lantern. It is easily raised as an annual from seed and does well in sandy soil in a warm, sunny position. The reddish terra-cotta, inflated, roundish calyx or lantern-like covering around the "cherry" (fruit), makes the plant highly decorative for autumn and winter. It is an admirable subject for Hallowe'en. Humea elegans, which has been mentioned in this column more than once before, is a splendid plant either for the conservatory or for the open air in summer. For effective sub-tropical bedding there are few better things, but it requires shelter; in a windswept place it would not show to advantage. The plants have to be grown on to blooming size before being set out. Why not try it next year?

Among berried shrubs that can be used for indoor decoration are these, including also some of the grasses and such-like: Bayberry or Candleberry, which grows on hill-sides and waste places along the Eastern coast; the berries are small and grayish in color, set in clusters close against the stem. Sprays of Berberis Thunbergii and B. vulgaris, the Common Barberry, are excellent. There is also nothing amiss with the jet black berries of the California Privet. Several of the Elaegnuses are also showy when in fruit, notably Europaeus, Bungeanus, patens, umbellatus and Hamiltonianus. Lycium vulgare, a very common and hardy shrub, is ornamental when berried, as also Lonicera iberica, Rhamnus dahurica, Rhodotypos kerrioides, Viburnum lentago, V. prunifolia, V. Opulus and the fine Snowberry, Symphoricarpus racemorus. Plantings of these for their berry effects is worth considering. In winter they are much to be prized.

Has any one tried the lasting qualities of different varieties of Roses, either of indoor or outdoor kinds? From some notes made by a lady whom I am well acquainted with, she found that Liberty was her best crimson, Mmc. Abel Chatenay and the Lyons Rose her best salmon pinks, Mrs. E. G. Hill, Mrs. Geo.

Shawyer and Lady Ashtown the best keeping pinks; while Pharisaer, which is very similar to Prince de Bulgarie, are the finest flesh-colored two. The latter, however, loses its salmon color too soon—sooner than its purer blush twin brother. The lasting power of Roses, as with other flowers, depends on their being cut at the right time and in slitting their stems or lightly hammering the ends, as we do in the case of Chrysanthemums. Then give them a good drink in deep water in a cool and, if possible, darkened room before arranging them in a vase.

Those who are on the lookout for novelties for the big National Flower Show at Philadelphia next spring, or for any other of the greater or lesser exhibitions, might hunt up the two rambler Roses White Tausendschön and Sylvia, both of which originated with the firm of Wm. Paul and Son, Waltham Cross, England. They are each good, and it ought not to be eight or a dozen years before they reach America (vide notes on this question in last month's Chronicle). two, Sylvia is the more desirable, being sweetly scented and easily forced. By the way, how quickly the little cluster Rose Geo. Elgar, which was shown at New York last spring, has gone ahead. It seems to be in the hands of half the growers in the Middle West already. It goes by the pet name of the "Yellow Sweetheart," and is a fine companion to Cecile Brunner. This name is often spelled Cecil Brunner, but wrongly. Hadley is giving a splendid account of itself, although just on the shy side as regards blooming. Ophelia, too, is everybody's favorite, being so vigorous and so beautiful. It was raised by the Paul above named.

It will soon be time to sow Clarkias for blooming in the spring. Get ready by about the first of January, sow in 4-inch pots in light sandy soil, place in a warm house, say 60 degrees, in a propagating frame with a top to it, and when the seedlings are through, thin them out to two or three at most, and divide the ball of soil, a part to each plant, when they are 4 inches to 5 inches high, and pot off separately. Or they may be carefully sown in seed pans, which is perhaps the better way, and the seedlings be pricked off and potted when of sufficient size. They should be grown cool and slowly after they have germinated and made a good start, as the Clarkia is very nearly, if not quite, as hardy as the Sweet Pea. Trained up into pyramidal form they make elegant and thoroughly delightful subjects for the greenhouse or conservatory. Some nice specimens were seen at the gardens of Mrs. D. Willis James, in charge of Wm. Duckham, last May. See that you get the bright salmon-colored type, as the mauve-colored kinds are not anywhere like so pleasing.

Cleaning and scrubbing the interiors of plant houses, more especially palm houses, is part of the work of the short days of November and December. It is some job, believe me. But cleanliness is, if not next to godliness in this case, certainly necessary for salvation—the salvation of the house and the stock in it. Palms are usually much-used plants, and not only are they improved by a good sponging, but they must at all costs be freed of whatever scale is on them. Only a manual operation will clean badly infested plants. The steady employment of Alphine is also recommended.

Many of us are always on the alert for something novel in the cut flower line. What better could we have than Tricker's winter-flowering Water Lilies? Probably they are not so uncommon after all. I mean winter-flowering Nymphaeas, as such, for there are several species whose natural proclivity it is to bloom when their brethren are at rest, and it seems to have been with these that Mr. Tricker has been working. He is improving the flowering qualities and adding to the color tones and selections of the flowers. He is also specializing in plants for aquaria, a decorative line closely allied to gardening that many of us know all too little about. These winter Nymphaeas require water at a fairly high temperature as one of the essentials of their successful cultivation.

That well-grown vegetables, when properly staged, can be made one of the attractive features of a horticultural exhibition, equally in the interest they furnish, the Roses, Carnations or other cut flowers or groups, has been proved over and over again at the few shows where first-class vegetable exhibits are seen. The ladies, even the grandest, stop to admire and appraise the culinary produce. Art, beauty and utility combine in a collection of kitchen garden materials as they only do in a choice table display of fruit. And why don't the societies offer a prize for this latter? They are missing a good thing.

One of the most interesting books I have hit upon recently is "Old Fashioned Gardening," by Grace Tabor. Some of my friends will no doubt put me down as one fearfully behind the times, since this excellent book was published in January, 1913. Yet I used to consider myself somewhat of an authority on gardening literature, and have given addresses before clubs and societies on this very subject. However, during the past two years there has been a serious hiatus in this particular line of my studies. When one is taken entirely away from old haunts and scenes of richest privileges, to a place entirely new and strange, it takes time to become re-established. Like a soldier whose base of supplies is severed, even if only temporarily, one feels in difficulties. But that matter is righting itself.

It was a great treat some months ago to visit the very excellent collection of books set out by the New York Public Library, and there browse for a while with old and new friends. The thought has many times occurred to me that if we as gardeners are ever to establish our profession on a better basis than it enjoys today, it will only be through an educational development, and no association, however well organized in other respects, will last permanently or wax strong that has not made, or does not make, provision for the mental as well as material uplifting of its members. Even the mechanical and industrial trades have made provision for the education of their members by the founding of schools and colleges, and as artisans are mostly engaged in towns and cities, it is easier for their organizations to supply the needful mental pabulum. Through our many gardening societies and similar institutions, we, however, can assist the younger members by furnishing collections of the best books. Gardeners are scattered in rural places, and the library is the easiest and the best means of providing a course of instruction.

Was it not Carlyle who said that the true university in these days was a collection of good books? Ruskin also says, "None of us need many books . . . but (Continued on page 492.)

# A Talk On Outdoor Chrysanthemums

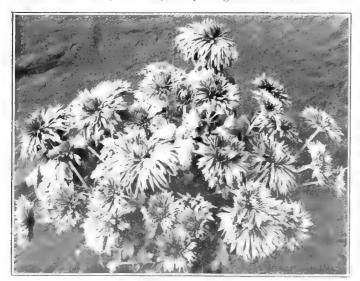

By Chas. H. Totty,\* New Jersey.

To the average lay mind, the term outdoor 'Mums, until a very recent period, simply meant one thing—Hardy Pompons, and while it is true that the Pompons are hardy enough, still the fact that they do not bloom until so late militates considerably against their being of so much value to the cultivator, since the foliage is often badly marked by frost and cold winds before the flowers develop.

NEW LARLY ITOWIRING CHRYSANTHEMUM BEAURIPAIRE

The type of plant we call "Early Flowering," which has been largely developed by August Nonin, of Paris,

TARIA FLOA CACO HESANIHIAUM POMPONOLIA

France, is by far the most satisfactory for growing outdoors, and unless the situation in which they are growing is very low or exposed, they will come through the average winter safely enough. This Early Flowering type on which Mr. Nonin has spent the best years of his life, is a result of a strain of seedlings

from the old ragged hardy 'Mums of our grandmothers' gardens— these latter did not have very much beauty but everyone admired their sturdy independence and the fact that from year to year their blooms braved the heavy rains and not infrequently the early winter snows. The number of varieties today of this Early Flowering type is legion, but a dozen that I would suggest as being the most likely to give satisfaction outdoors would be about as follows:

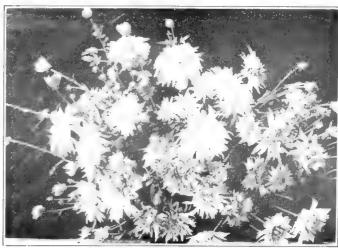

White: Cranford White; Dorothy; Marie Dufour; Wm. F. Collier, and Normandie. The latter variety, Normandie, is often classed as a delicate shade of pink, but as a matter of fact the earlier flowers are almost invariably white. Normandie is the earliest variety

NEW TARIA HOWERING CHRYSANTHEMUM MILKA.

we have and under average conditions the most satisfactory we have of this type.

Yellow: Cranfordia; Carrie, and October Gold. Pink: Beaurepaire; Eden; Le Danube, and Miss Burchfeld.

NIW INRIVITION FRING CHRYSANTHEMUM ODETTE.

<sup>\*</sup>Extracts from le tree given it Country Life Exposition, New York

Red and Bronze shades: Harvest Home; Vesuve; A. Barham, and Billancourt.

There are many more excellent varieties, but I am merely mentioning the very best and earliest for those who may desire to confine their list to a few varieties.

#### HARDY POMPONS.

This is the type of 'Mum that is most largely grown for outdoor flowering, and is valuable if one secures the right varieties. By the "right varieties" I mean those that will flower early enough outdoors to develop perfectly before the weather gets too cold.

The best of all the Pompons is the variety Lillian Doty, a large flowering pink, introduced to the trade in 1912, which will make stems four feet long. The color is delightful whether grown under glass or outdoors, being the clearest bright pink imaginable. The individual flower measures approximately three inches across, and every stem will carry four to eight of these flowers.

A list of twelve of the best varieties of Pompons in assorted colors would be about as follows:

Pink: Lillian Doty; Donald, and Minta.

White: Queen of the Whites; Jas. Boone; Waco, and Myer's Perfection. I might also include in this white section the variety Garza. This variety is really an Anemone-flowered sort but I am assured by one of my customers who has a summer home along the Jersey coast that it is entirely hardy and has bloomed at her place year after year until December 1.

Yellow: Jeanette; Wm. Lahey; Golden Climax, and

Zenobia.

Crimson and Bronze sorts: Julie Lagrevere; Urith;

Tiber; Sulky, etc.

In addition to the above varieties, there are many others very, very beautiful and well known, such as Baby Margaret, a lovely white, and Baby, the tiniest yellow variety known, but I have omitted them in these notes on outdoor Chrysanthemums because they usually flower too late for one to derive much satisfaction from them.

The points on which the Pompons suffer in comparison with the Early Flowering varieties are that the former do not bloom for several weeks after the Early Flowering varieties and are not nearly so large when they do come. There is, of course, a place for both varieties, since one type does not bloom until after the other has gone and the Pompons have one advantage in their cast-iron hardiness. I have seen Pompon blooms come through ten degrees of frost when the same temperature has blackened the open flowers of the Early Flowering type.

#### SINCLE CHR SANIHEMUMS.

It has been thought until very recently that the Single 'Mums would not develop outdoors. This is a great mistake, as some of you have perhaps discovered by this time. A customer of mine, Mr. Francis H. Bergen, of Summit, N. J., is perhaps the most successful man I know of growing Single 'Mums outdoors. He has a border on either side of his front drive leading to the front door of his home, and these borders from the middle of October until late in November are "things of beauty," and the most striking types in the collection are the Single 'Mums.

A list of a dozen of the best single varieties would

be about as follows:

White: Elsa; Gladys Duckham; Mensa, and Snow-flake.

Pink: Ivor Grant; Stanley Ven; Mrs. Buckingham, and Miss Sylvia Sleede.

Yellow: Polly Duncan; Golden Mensa, and Marion Sutherland.

Crimson and Bronze: Ceddie Mason; Brightness and Margaret Walker.

In the single types we have many very beautiful varieties but they need a greenhouse for their proper development, therefore I have omitted them.

Granted that one has the best varieties in their different types in each section, what is the best way to handle them in order to get the best results? Secure them from your dealer in the spring as soon as the weather is warm enough and the soil is in good condition outdoors. Set out the plants in rows eighteen inches apart with twelve inches between the plants in the rows. They should be kept pinched back during the months of May and June in order to keep the stock dwarf and robust and prevent the plants growing too high, necessitating considerable staking.

Because you are not going to get flowers until fall, do not neglect the plants all summer and expect to get them robust when you want them. If the summer is hot and dry, watering should be resorted to once a week and the plants sprayed in the cool of the evening, which will in very hot weather work wonders in keeping down the black and green aphis, which are

the worst enemies of the Chrysanthemum.

Regarding feeding, you, I presume, are familiar with the fact that the tremendous flowers one sees on exhibition from greenhouses, have been fed with artificial fertilizer to bring them to their high state of perfection. Here again the beauty of the outdoor varieties is manifest, in that they do not need this expert treatment as the exhibition varieties do. If the plants when they are set out are planted in good, rich, mellow, average garden soil they will get along very well. If the leaves on the plants are running small and showing signs of not being as large as they might be, a sprinkling of bonemeal applied to the soil and several inches of well decomposed stable fertilizer spaded in during the month of August will help wonerfully in finishing the crop.

As a rule in the early fall months the plants are getting all the moisture they need from the rains and therefore liquid feeding may be dispensed with.

One mistake that amateurs in gardening often make is in assuming that the hardy types do not require any attention from year to year. If one is to grow these varieties to the highest point of perfection, the clumps ought to be taken up in the spring and broken into individual plants. These individual plants when planted in new soil will invariably produce flowers of much finer quality than the old clumps that have been left undisturbed. In this respect the 'Mums do not differ from other perennial plants of a like character, which are benefited by this annual or biennial moving and rejuvenation.

After the plants have flowered the question of protecting them through the winter is of paramount importance. Mr. Bergen, whom I have previously mentioned, says that by his method he has carried his plants over many years and has yet to lose a root. After the plants have finished blooming, he cuts them down to about eight inches from the ground and permits the autumn leaves to blow in and fill up the beds. If enough leaves do not blow in naturally he takes leaves and covers the beds to a depth of six or eight inches and then lays pine branches over the tops of the beds to prevent the leaves blowing away. So treated plants will not suffer from freezing and thawing in February and early March, which is the

cause of so much perennial stock, usually classed as hardy, dying. The plants being kept covered from the sun stay frozen all winter and no harm results. This method would not be so effective in a position where the ground is low and the plants are liable to stand in water. I am convinced that a large percentage of 'Mums die off in the winter because they are affected with "wet feet," but a well-drained piece of ground covered in the manner mentioned will bring through any of the 'Mums above-mentioned in good shape.

Hardy 'Mums, while not as showy as a bed of Delphiniums or other blazing summer beauties, are wonderfully attractive and useful after all other flowers are cut down by frost and will return to the cultivator results in proportion far greater than the labor be-

stowed.

#### "'MUMS AT THE MOORINGS."

"The last rose of summer" has always held a cherished place in the hearts of all, but how tame the dear little rose seems when it is forced into comparison with the Queen of Autumn, especially when placed beside the splendid specimens shown at Col. Converse's place. Growing specimens is a pleasure in itself, but opening wide the doors and inviting the public to enjoy them with you certainly must add greatly to that pleasure.

A general invitation was extended to the public to visit the Converse green houses, Marion, Mass., on October 31, and must have been anticipated by it, judging from the way people came from all around southern Massachusetts and Rhode Island. Automobilists galore, augmented by pedestrians, filled the houses to overflowing and kept the employees busy

trying to prevent a blockade.

A finer display of Mums it was never the pleasure of the writer to behold, mammoth specimen blooms, plants with six flowers to the plant, dainty singles and semi-doubles, pompons and huge specimen bush plants vied with each other to attract the eye and win their just merit of praise.

Among the standard varieties, that mountain of whiteness, Wm. Turner, called forth unstinted praise, while Mrs. J. Purroy Mitchel was a very close second among the whites.

To the writer the finest thing was a magnificent specimen of Meudon, a lovely bright pink variety with foliage peeping out from the base of the flower, and right here it might be well to mention that finer foliage was never seen than Mr. Roy had on his Mums this year,

Geo. Hemming, another very attractive flower, purple amaranth with a silver reflex, while not as large as Meudon, claimed much attention on account of the richness of its colorings, which, to the writer's mind, was finer than that of Earl Kitchener.

Among the yellows James Fraser and Daily Mail were much the finest, the latter, with its fine narrow petals drooping gracefully, would be the writer's

choice.

His Majesty, an intense crimson, formed a striking contrast with surrounding varieties, and Marquis V. Venusta, pink, while only partially developed, gave promise of a grand specimen.

Among the others which were extremely well done were Col. Converse, bronzy crimson; Tarrytown, salmon; D. B. Crane, Calumet, buff; Kewanee, buff; Gilbert Drabble, Thos. Lunt, crimson and orange; Alice Lemon, soft pink, and Walter Jinks, rose pink.

One whole bench was devoted to plants grown in 6-inch pots with six flowers to a plant made a most attractive display. The varieties which proved most useful grown in this manner were Geo. Hemming, Wm. Woodmason, Tarrytown, Meudon, Mar. V. Venusta, Wm. Turner, Lena Filkins, Mrs. Duckham and Rose Pockett.

A yellow sport of Mrs. D. Lyme looked very good and under the master hand at "The Moorings" ought to make a place for itself.

Col. Converse and his superintendent, David F. Roy, certainly ought to be congratulated upon a successful season and a grand "open house" day.

W. F. TUKNER.

AN ASSET IN THE COUNTRY LIFE PERMANENT EXPOSITION NEW YORK, DURING HIS CHRYSANIHLMUM SHOW, THE LERST OF A SERIES OF FLOWER SHOWS TO BE CONDUCTED BY THE INSTITUTION TO ACOUST INTEREST IN COUNTRY HOME LIFE. IN FRONT OF THE BUNGALOW, SEEN IN THE BACKGROUND, A GARGEN OF TOTAY'S FARLY FLOWERING VARIETIES, WAS ARRANGED WITH A MOST NATURAL PLANTING EFFECT BY MAN SCHLING, OF NEW YORK.

#### THE EVOLUTION OF THE CULTIVATED CHRYSANTHEMUM.

The development of the cultivated chrysanthemum furnishes a most remarkable example of the ingenuity and perseverance of the plant hybridist. Although a 16-petalled Chrysanthemum is the emblem of Japan and this flower is called the "flower of Japan," all evidence goes to show that the Chrysanthemum is indigenous to China. Later it was imported to Japan, where it achieved a success far exceeding that in its native country. According to Chinese history, the Chrysanthemum was cultivated in China over 2,000 years ago. Confucius, who supposedly lived 500 B. C., mentions the flower under the name, "Li-Ki," and some Chinese pottery, now preserved in the British Museum, which dates as early as 1426-1436, bears an exact replica of one of the earlier forms of the Chrys-Previous to the importation of the Chrysanthemum into Europe, the Chinese were known to graft certain kinds and cultivate specimens similar to the single-stemmed varieties of the present day. They even adopted a style of nomenclature, which bears little resemblance to our modern system; for instance, one favorite was called "The Drunken Lady," owing to the drooping habit of the flowers during the

The earliest record of the introduction of the Chrysanthemum into Europe dates from 1688, when it was brought into Holland by Brevnius, a merchant of Dantzig, who, in the next year, published his "Prodromus Plantarum Rariorum," which contained accurate descriptions of the varieties then growing in Holland. In spite of its easy cultivation, however, interest in the Chrysanthemum soon died out and the varieties described by Breynius passed out of existence in Holland. England is the next country to which we have any record of the Chrysanthemum being imported, being brought this time in a dried state from China, in 1698-1703, by James Cunningham, Surgeon to the East India Company in Amoy, China. In 1764 living specimens were introduced into England; these were sent from Nimpu (probably Ningpo), China, and were cultivated by Philip Miller. The plants were also grown in the famous Chelsea Garden, in London, and it was from here that herbarium specimens were collected and preserved which are accessible at the present day. The specimens are labeled Chrysanthemum indicum and show flowers with small double heads, undoubtedly being one of the true "indicum" type.

The next important step in Chrysanthemum culture was in 1789 when a French merchant, M. Blancard, brought home three varieties from China: one white, one violet, and one purplish. Within three years there was scarcely a garden in Versailles that had not adopted the Chrysanthemum, the flowers then being about the size of the present-day carnation. M. Blancard's purple variety was introduced into England in 1790. Concerning this introduction, Sabine writes: "This is the purple variety; it had been transmitted to this country from France in 1790, and after its arrival here the changeable white was obtained from it by cultivation. Between the years 1798 and 1808, inclusive, eight new varieties were imported from China into England in the following order: the rose and buff together, in 1798; the golden yellow and the quilled yellow together, in 1802; the sulphur yellow at

the latter end of the same year; the Spanish brown, in 1806; and the quilled white and large lilac together, in 1808. Of these the sulphur yellow was imported for Thomas Evans, Esq., of Stepney, and the remaining seven sorts for Sir Abraham Hume. Later importations have produced two others, the tasseled white, in 1816, and the superb white in 1817."

For a considerable time after their introduction the French and English gardeners had been experimenting with the object of raising Chrysanthemums from seed. Success was finally attained by a French officer, M. Bernet. The previous year he had discovered some withered flower heads in which he was surprised to find seeds bearing all the signs of perfect maturity. Keeping his discovery a secret he carefully tended the seeds himself, and in the fall of 1827 was rewarded with several fine varieties of plants.

In 1843 Mr. Robert Fortune was sent to China by the Royal Horticultural Society of London in search of rare plants. On his return in 1846 he brought, among other curiosities, two small-flowered Chrysanthemums know as the Chusan Daisy and the Chinese Minimum. These, according to James Salter, were probably varieties from the true Chrysanthemum indicum of Linnaeus. The plants, however, did not find favor with the English growers owing to their small flowers, but they were appreciated by the French and were used for hybridizing. According to several authorities, the pompons of the present-day Chrysanthemum originated from these two varieties. The introduction of the Japanese specimens into Europe dates from 1862, when they were brought back by Mr. Fortune from his second trip to China. Salter, in describing these new plants, says: "Some varieties were spotted and striped; others were fantastic forms called Dragons; and one noteworthy specimen was a beautiful fringed white flower, in appearance more like a Japanese pink than a Chrysanthemum.

The development of the Chrysanthemum before its introduction into Europe is a mystery. Hemsley states that "it is impossible to determine the parentage of some of the Chinese double Chrysanthemums, and it is highly probable that some of them are of hybrid origin between Chrysanthemum indicum, the small vellow, and Chrysanthemum morifolium (sinense). The same may be said with regard to some of the early figures of double varieties of Chrysanthemums, which authors have identified with one or the other of the two adopted species. The slender Chusan Daisy, the parent of all the pompons, for example, is probably of mixed origin, though it may be pure C. in-

dicum."

The true Chrysanthemum indicum in its wild state is found from Hongkong to Pekin, the ray- and diskflowers both being yellow. Chrysanthemum morifolium (C. sinense) is found in the Luchu Archipelago and the Chinese central province of Hupeh. It is more robust than C. indicum, the leaves are thicker and tomentose, and the ray-flowers are a different color from the disk-flowers.—From Missouri Botanical Garden

#### PREVIOUS TO ELECTION.

White: Why did you support Black for re-election to Congress? What has he ever done for his constituents to deserve it?

Green: Has he not supplied us with free seeds and does he not promise to fight for free implements if re-elected? What more do you want?

# Gardens Around Philadelphia

A friend who had visited the California Exposition and the convention of the Society of American Florists in San Francisco this summer, and who had been whirled about from place to place with much rapidity over a period of from three to four weeks, said on his return that his mind was full of rather amorphous impressions of the many scenes and places and incidents of the journey.

To some extent that is the condition of my mind after a flying visit, lasting only four and a half days, to two of the best-known gardens in the neighborhood of Philadelphia, to several gardens in the Lenox region of the Berkshire Hills in Massachusetts, embracing a trip up the Hudson River, and lastly to the rock garden and fernery which John Huss has charge of at Hartford, Conn., and to Elizabeth Park there.

The visit to the Philadelphia places was on the rainy Saturday morning of October 4, when Mr. John Wanamaker's estate, Lyndhurst, at Wyncote, was seen, and Mr. Joseph Widener's place in the same neighborhood. Each of these lies a few miles to the eastward of Philadelphia. The Widener estate is the more extensive of the two, embracing several hundred acres, but as Lyndhurst, which John Dodds supervises, was the first to be visited, it is fitting that the notes thereon should be kept in their proper order.

#### LYNDHURSE.

Looking back, the outstanding impressions of this trimly and well-kept demesne are the new Italian garden, not entirely completed yet as it is intended it will be, but very beautiful; the many excellent groups of choice evergreens, some of the trees representing the most perfect specimens of their kind we have seen; and thirdly, the plants under glass.

The glass range is neither considerable nor inconsiderable, and some of it may be demolished to conform to the ground alterations that are in contemplation in connection with the Italian garden developments, but whatever glass was taken away would be restored in a new and up-to-date form.

One of Mr. Dodds' specialties is Dracaenas of the broad-leaved terminalis type, and he is the proud possessor of quite a batch of promising seedlings. It was a treat to observe his wonderful enthusiasm over these plants, a class that receives comparatively too little attention in the way of hybridization from even the trade growers, let alone the professional gardener.

It was here that the bright yellow form of Pandanus Sanderiana originated, a specimen of which won the \$200 first prize for the best new plant of this description at the National Flower Show in New York in 1913. The stock was purchased by Robert Craig Co., Philadelphia, who unfortunately lost their plants, and all that remains of this very fine decorative warmhouse subject are a good-size plant here at Lyndhurst and several off-shoots that have been rooted from it. Mr. Dodds strokes these lovingly, and feels assured that this good thing has not passed out of ken yet.

Another chief specialty in the indoor plant line was an uncommonly fine batch of Cyclamens in 6-inch pots, these having a spread of 12 inches to 14 inches at the time of my visit, and were, one is almost safe to say, the finest batch anywhere to be found along the Atlantic Coast. There was too little time to question Mr. Dodds as to his method of treatment, and that may be left to the editor to inquire of him.

Bush Chrysanthemums in benches and singlestemmed ones were each of the highest quality. Batches of Primula malacoides and the Baby Primrose, Forbesi, gave promise of elegance and brightness in the darker months ahead.

Most of the other popular classes of plants are here grown in fine condition, including Orchids. The magnificent collection of palms in the large house is also deserving of special mention.

It will serve as an index of the mass of soil used in the benches and in potting annually, when we say that a thousand loads are required. The soil, if I remember rightly, is prepared somewhere on the estate by having a liberal quantity of manure plowed in in the fall, this soil then being collected for use when wanted the next year.

Roses, all on their own roots, furnish a regular supply of long-stemmed flowers the season through.

One smaller span-roofed house also is given over to winter Tomatoes, the variety being Lolliard. These are sown at the end of July, and are grown out-of-doors until they are housed at the end of September, when about 2 feet or a little more in height, being very short-jointed and having fruiting trusses quite low down near the pot. These trusses set, and the plants are kept in large pots all winter, only being top-dressed and fed with liquid manure.

Passing to the open air, some evidence of the enormous amount of work that Mr. Dodds had in grading up the slopes on the north side toward the railroad, was brought to notice, but, as he said, days, weeks and months of labor look like nothing in operations of this description. There are dry-stone retaining walls to be built, hundreds, or it may be thousands, of loads of soil to be carted; big trees to be transplanted, and lesser ones brought from a distance and put here; turf to be laid down; roads and walks to be made, and made properly, so that they will be sound, dry, and wear well; and lastly no less an undertaking than the entire removal of a dwelling house, with a stone basement was necessary, this being brought from the main entrance upon rollers, a distance of perhaps 150 to 200 yards. To shift a modern villa like this seems like a tall story, yet it was done without a crack or twist.

Outside the gates are groups of choice Conifers, as well as sinuous masses of them on either side of the fine sweep of driveway. As I will have occasion to refer to similar evergreens in the other notes in this series, the kinds need not be named at present. It was a great pleasure, however, to see so many evergreens so splendidly planted, and one will go far before seeing these Conifers used to so good advantage. Any gardener who has much work of this description to undertake in the near future, and who doubts his own ability to carry it through successfully, would certainly obtain some admirable lessons in the gardens at Lyndhurst. There was no patchwork about the planting, no monotonous grouping and "knotting" of set forms or types, but yet a well-balanced and elegant, varied mingling of kinds of Arborvitae, Junipers, Retinisporas and Pines.

The lawns are extensive and undulating, while there is a nice furnishing of the large deciduous trees throughout the grounds. That great pest of so many gardens, Fall Grass, however, was too conspicuous to be desirable. Much pains are spent in trying to get rid of it, and Mr. Dodds finds his greatest success in keeping it down has resulted since the introduction of heavy motor lawn mowers.

and annuals.

A large circular mounded mass of bedding plants of much richness, placed near the tennis court, arises vividly to mind, containing as it did splendid Crotons in the center, with vellow and red Coleus around this in geometrical lines and masses, interspersed with Geraniums and Achyranthes Brilliantissima. The tennis court, situated handily to the house, was distinct in this, that it was of wood, covered with canvas and painted a leaden-gray color. It appeared rather trying to the eyes, which was the only objection to it that one could observe, and certainly a fast game could be played on this court. It was surrounded by a whitepainted ornamental trellis, with a broad top that gave it the character, at first glance, of a pergola, and this idea was enhanced by the burden of climbing plants upon it. Large Orange trees in terra-cotta vases were set along the edge of the court.

Now we come to an all too brief description of the Italian garden already mentioned, which is purely formal, of course, of rectangular shape, reached by steps from the southern side, having paths and outer border surrounding it, and flagged paths bisecting and crossing it except for a rectangular Water Lily pool in the center. A hedge of Golden Arborvitae has been planted, and a broad border left for hardy flowers

At the side furthest from the dwelling, that is to say, the north side, there is a summer house with pergolas carried out from it on either side. This banks up the view as one advances over the lawns from the house, and was necessary to give balance to the whole

plan. Even this year, the first since the planting was done, a most attractive, pleasing and restful display resulted. Mr. Dodds has the true artist's eye so necessary for success in flower gardening, and used his plants in prodigal splendor—great masses of them, such as Tiger Lilies, Lilium auratum and L. candidum, of which a thousand bulbs alone had been planted; Snapdragons, Dahlias, Galtonia candicans, China Asters, the Scarlet Sage or Salvia, also Salvia Greggii, dwarf Phloxes, Roses, Eupatorium perforata, together with big clumps of hardy Peonies and other dwarfer plants along the front. But more striking than all was perhaps Celosia pyramidalis, which represented a strain saved by the superintendent himself here. The color and development of the plumes were very fine; and a brownish-crimson one called for special notice.

At the corners of the flagged paths and elsewhere. to give balance and dignity, as well as beauty and interest to the garden, were planted shapely Junipers, 5 feet high, the central area, except for paths and the Water Lily pool being of grass. Urns were also set about, and specimen Blue Spruce at the four main A retaining wall in connection with this garden was covered with Rambler Roses.

Other evidences of the developments that were in progress were seen in the huge evergreen trees which had just arrived from the nurseries of Hicks and Son, Westbury, L. I.

There is a considerable amount of semi-woodland, or woodland left somewhat in its natural condition on the place, and here bulbs are naturalized. A collection of choice kinds of Darwin and May-flowering Tulips had also been planted in a sloping piece of lawn directly in front of the south entrance.

Mr. Dodds, unfortunately, at the time of the writer's visit was convalescing after an illness. We trust that he is now thoroughly re-established, and shall look forward to re-visiting Lyndhurst if for nothing more than to see the progress and the up-growth of that Italian garden. He intends to go strongly in for hardy

flowers, and is willing to hear of any subject suitable to his needs in this direction.

#### LYNWOOD HALL.

If the outdoor gardens at the Wanamaker place impressed me most, it was the wonderful diversity and remarkably high keeping and quality of the indoor crops at Mr. Widener's Lynwood Hall, where Wm. Kleinheinz has charge, that furnished the chief satisfaction. Yet here, too, it seemed as though a new place was being made, so extensive are the alterations out of doors. The fine sunken garden remembered by so many visitors of previous times has given place to a French garden, laid out in geometrical Boxwood beds, which are filled with the showier kinds of bedding plants like Coleus. Geraniums, Achyranthes, and so forth.

Another story is being built to the mansion itself, and to conform to the designs of the architecture, the surrounding grounds are being altered. Very large numbers of Rhododendrons, many of them quite large specimens, brought direct from Holland, have been planted, and as the work was most thoroughly done, as would be expected from Mr. Kleinheinz, scarcely one has shown the least sign of being any the worse for its travels.

Unfortunately, an established plantation of fine bushy plants of Azalea amoena that bordered one of the chief driveways, said plants being 2 feet high and as much through in most cases, have been nearly ruined this last summer by the Rhododendron lace wing fly, a minute aphis-like insect that attaches itself closely to the under sides of the leaves and extracts every drop of juice from them, leaving them as brown as parchment. Although sprayings twice a week were tried, the little pest sticks so closely that it seems almost impossible to dislodge him, or overcome him. As a last resort Mr. Kleinheinz talked of lifting the plants, dipping them in a tobacco solution, and replanting

Hardy Bamboos are missed, but a wonderful collection of the Reed family, such as Eulalia zebrina, E. gracillima and others of the type, together with a Giant Reed, Arundo Donax, all planted in colonies and flowering profusely in the heavy soil, former quite a tropical-looking scene in the heart of the grounds, surrounded by a rock garden formation and having nearby a rustic bridge almost completely enveloped in the Kudzu vine. This latter grows anything up to 25 feet in a single summer, although it gets killed back or cut back almost to the ground every winter, but the growth starts again from the crown of the plants in early spring. The foliage always remains a lively green, and this vine does not seem to be in the least subject to any form of insect pest.

In the making of one of the new roadways, long hedges of the golden Thuya, "Geo. Peabody," each plant 4 feet high, have been planted, these also having been imported from Holland. The handsome, not to say remarkable, effect of this perennially "golden" hedge may be imagined, and it is doubtful whether a similar ornamental hedge could be found anywhere in the United States.

Owing to some road grading, a retaining wall had to be built as part of the operations, and here choice was made of tall evergreens in the planting behind, while in order to furnish a quick effect during the summer, Petunias, Verbenas, Heliotropes, Begonia semperflorens and other subjects had been planted. Masses of Coleus Verschaffeldti had also been used most tellingly, the plants having been allowed to grow into large straggling masses and calling for close inspection to identify them in their wonderfully elegant form. These could be seen from some distance away.

In the ground operation near the house, or between the house and the magnificent stables, 8,000 loads of soil had been used, merely to round off part of the lawns, this soil having cost an average of \$1 per load. Altogether there are 60 acres of lawns.

The glass department is in a separate part of the grounds, well away from the house. It is a compact assortment of very fine, spanned-roofed houses, all in tip-top condition. The output of flowers reminds one more of a commercial place than of a private establishment. One thousand Valley Pips are used every week, and from 1,000 to 1,200 longiflorum Lilies are forced.

Already in October Sweet Peas were planted— Zvolanek's strain—these being 4 inches high, in 4-inch pots. A house is devoted entirely to Gardenias, and of course, Chrysanthemums are in great variety, Mr. Kleinheinz being president of the Chrysanthemum Society of America. Three thousand plants are grown as single-stem specimens, and as many as 50 to 75 blooms are cut daily during the flowering season. Bush varieties and others grown as half standards make fine material for cutting from. A few plants are also trained in globular and fan-shaped form for decorative purposes in the house and conservatory. The first cut of Lilian Doty was made on October 6. The Chrysanthemums are not grown in benches, but in 6-inch, 7-inch or 8-inch pots, as it is found that they are better under control that way. The plants are shifted into 4-inch pots about the 20th of May, thereafter into 7-inch to 8-inch pots.

The new Begonia, Mrs. Peterson, was seen here with its beautiful brownish-red metallic leaves. Unfortunately, however, its flowering is not always as free as one could desire, and the color needs improving.

The beautiful feathery Nephrolepis Smithii, one of the plumose or lace type, is made use of most effectively as basket plants, while Teddy Jr. and the new very handsome John Wanamaker are two kinds much employed for pot work. The first-named is the dwarfer

of the two, the latter used for bolder work.

The Rose houses have very deep cement benches and the soil is covered with a manure mulch. The plants were in the pink of condition; nothing finer could be The plants were absolutely spotless, seen anywhere. comprising My Maryland, Prince d'Arenberg, White Killarney, Ophelia, Sunburst and others. A house is devoted to American Beauty, and most of the plants were put out in the benches in new soil on the 20th of June, the old plants beeing thrown out entirely.

A large collection of Cattleyas and other orchids are grown, including Cypripediums, Oncidium vericosum Rogersi (these being in pots suspended from the glass), with Calanthes and other subjects.

Carnations are also a very strong feature, comprising all of the favorite sorts. Gorgeous, a fine crimson-scarlet, was noticeably good. The cuttings are taken in December, so as to give a long growing period, and are potted on into 4-inch pots, then put into the benches in the first week in July, and allowed to flower from early in October onward.

The quantity of bedding plants propagated annually runs to 55,000, all of which represent cuttings that have to be potted, housed, and grown on; certainly entailing a very vast amount of labor each year.

These are only a few desultory notes of a finely appointed place. One will travel far in order to find a better range of houses, and the estate, apart from the lawns and ornamental grounds, is far stretching, one of its special features being the private horseracing track. The electrical plant, the stables and all the other modern features embody the latest improvement and each deserves special reference in themselves were there space. Over all of this Mr. Kleinheinz presides, and it may safely be taken for granted that he is never very idle.

In the next number of the Chroxicle I will relate some of my impressions of the Lenox estates.

THATRASI.

#### SCHIZANTHUS AS A SPRING-FLOWERING PLANT.

The value of Schizanthus as a spring-flowering plant cannot be overestimated, and a good batch of this popular yet dainty and light flower is more appreciated at that season of the year than at any other time. Not only do the plants flower more profusely, but the absence of that scorching sun which is experienced later on in the year allows them to retain their beauty and freshness for a considerable period. A conservatory in which the main subjects are Primulas of sorts, herbaceous Calceolarias and Schizanthus wisetonensis is a sight to remember, writes Chas. Trott in The Garden.

We generally sow the seed the last week in August, and pot off the resultant seedlings as soon as possible in  $2\frac{1}{2}$ -inch pots, placing them in a light position, yet not in the direct rays of the sun. A frame outdoors having a northern aspect is excellent. As soon as growth has become active, pinch out the growing point and repeat it later, but the second time pinch all the laterals as well. This will lay the foundation of a strong, well-branched plant. Before the plants get root-bound in the pots (and this must never be allowed to occur, as the plants may as well be thrown out as allowed to flower), a further move into 5-inch or 6-inch pots must be given. The 5-inch pots are perhaps the best, as it is not wise to over-pot them. They are impatient of careless watering and drought, either extreme proving fatal to one's hopes. Steadily keep to the pinching and repotting, never hastening the plants in any way, and by the middle of October they may be potted into the final or flowering pots. These may be either 8 inches or 9 inches in diameter, according to the grower's discretion or convenience. The soil for this potting is very important, and should not contain too much humus and no artificial manure, unless it is a little bone-meal. Good strong loam should comprise three parts of the mixture, the other part consisting of wood-ashes, lime rubble and leaf-mould. Firmly press the soil around the plants as the work proceeds, and leave quite 3 inches for top-dressing if in a 9-inch pot, and a little less if in an 8-inch pot.

Stake the plants nicely, and if the weather is still open they may be left in the frame. I have known them to experience 5 or 6 degrees of frost and take not the slightest harm. However, it is always the best plan when they have got so far on to take no chances; but never give them more heat than is absolutely necessary to be safe. As soon as they start growing again, they may be topdressed with the same mixture as advised for the final potting. They may then be given a little diluted cowmanure, gradually increasing the strength of it until the flowers look ready for opening, when it is best to cease.

They may then be moved to the conservatory.

#### ANNUAL CONVENTION

National Association of Gardeners Boston, Mass., December 9-10 If interested see page 503

#### THINGS AND THOUGHTS OF THE GARDEN.

(Continued from page 484.)

valuable books should, in a civilized country, be within the reach of everyone." Do not for a moment imagine that reading is intended to take the place of practical training. In gardening it can never do that. The young gardener must be trained in the garden, the potting shed, the greenhouse and in the vegetable and fruit quarters. Gardeners in the Old Countries are so taught. Of all gardeners, perhaps the Scotch are the most completely equipped, although I also think the English and German men are very broadly trained. The young Scotsman is first of all thoroughly grounded in outdoor routine work, from trenching, pruning, planting and levelling of ground, to the fullest control of all the vegetable garden and the outdoor pleasure grounds and flower gardens. Many a man goes right through all this before he goes under glass. All the while, however, he is observing the indoor operations, and on rainy and wintery days he is called in to assist in plant house or grapery, while all the while he must take his turn "at the wheel." He learns stoking. On Sundays he has charge of the watering and ventilating of the glass ranges or part of the range, if the place is a large one. Naturally, the indoor foreman or general foreman supervises, at least if the young man is a raw hand. By and by he is put more fully "on his own." That is the Scotch method of training gardeners, unless it has altered in the last few years, which I doubt.

It might seem a "come-down" for an outside foreman to take a journeyman's place under glass. It is not so regarded. The young man gets charge of a range of fruit houses, or these and some of the plant pits. Under able guidance, and with the splendid elementary training already received, it is a simple, straightforward job to take in hand crop after crop and make a success of it. Orchids, Roses, Carnations and certain warm-house subjects require special attention and they receive it. A man may specialize. Many do, either at this stage or before, but the great aim of the true gardener is to make himself an "allround man. Eventually the post of indoor foreman is attained, just as the outdoor foremanship was, and now begins the search for a headship or superintendent's place. This often necessitates several years of waiting, but it will scarcely be doubted that the man so trained is a finished and trustworthy gardener.

This is away from the subject of books, however, and we may at once ask what course of reading would be best to be pursued in connection with one's practical experience. Perhaps no one outside a school of horticulture ever carried through a steady course of book reading. Most of us dip here and there as we go along. If we have a good reference work we are content. That is because of our utter lack of any system, and the time has come, it seems to me, when the National Gardeners' Association should draw up a course of reading for the guidance of its younger members, whether they care to follow it or don't. I would like to insist on a knowledge of the history of gardening, and the reading of such a work as this of Miss Tabor's would be one of the books to be recommended. Without a knowledge of the successive stages by which gardening has developed to its present stages we cannot call ourselves intelligent craftsmen. Moreover, such knowledge might save us from attempting things that long ago were either verified

or disproved. Following that would come the histories of given plants, the meaning of plant names, some of the uses of plants—I mean from the economic and medicinal point of view. Some of our grand-parents knew a whole lot more about this than we do, and it adds so much to the interest of our work among the plants to have this knowledge. What is called geographical botany, or the study of the distribution of plants over the globe, is also highly entertaining and has a direct practical bearing on the day to day work of the garden. What gives the note of piquancy and delight to the writings of Lord Redesdale, who is elsewhere mentioned in this number of the CHRONICLE. or to those of William Robinson, but the intimacy with which they speak of plants in their native habitats? Of course, these men have travelled and seen for themselves, a privilege all of us cannot have, but we can learn from them and have our imagination quickened. Thirdly; there is the scientific side of the subject, and a big side it is. Entomology, with systematic, morphological and histological botany enters into the reckoning, and believe me, these names are not so terrifying after six months' close reading of the right kind of books. With these subjects entered upon, and some knowledge of agricultural chemistry, the gardener is then well able to take care of himself in any crowd, or in conversation with those who employ him and who have a right to look to him for the highest instruction and advice. Just at this point rises the eternal question of demeanor and the value of tact and other factors of the make-up of the complete (professional) gardener. Equally it raises the discussion of the relationship of the employer to the gardener. Shall we enter the discussion? Not this time!

#### "BYSTANDER" AFTER THE "ONLOOKER."

The very able article by the pen of "The Onlooker" in your last issue was written by one possessing a far larger knowledge of the whole horticultural field than the average onlooker possesses, and one would be led to believe that he is a very keen "onlooker" indeed, as his article covers a very wide field, dealing with some experiments and some proved results.

I would like to answer the question regarding the wintering of annuals. I have noticed that seeds of Celosia plumosa have wintered in the open ground, germinating late in the following spring and making big plants before the fall. This "Onlooker" will agree is quite a tender annual. I believe it is quite common to see annuals come up the following year after having had a season in the ground.

I believe the idea for autumn sowing is that the seeds remain dormant all winter as the germinating power of some seeds is improved after being subjected to frost in the ground; his remarks on sweet peas and fall sowing I fail to understand. Does he suggest that through the frost-bound winter months that with the dry growth of the sweet peas checked, the roots continue to elongate and thus are strengthened for the coming flowering season? This is certainly news, as it is generally admitted that the growth of plants takes place in a higher temperature than germination does. Each seed has its maximum and minimum temperature for germinating. If the sweet pea had any characters of an herbaceous perennial then it would still be hard to understand and as a reader I would be glad to know what he means when he says that "If there is sufficient frost to check top growth, all may

be well; the roots don't stop. . . ." (Page 441, column 1.)

I agree with "Onlooker" that the New York Botanic Garden is, from a horticultural standpoint, disappointing, and I should think from a botanical standpoint equally disappointing.

In his interesting remarks relating to the botanist and his habit of plant name changing, one asks himself whether those remarks or arguments indicate that plant naming is complete and that the first name a plant receives it must stand or fall by it, and that classification stands for nothing, but that a plant's name must be handed down from father to son and no attempts be made to see if it is named correctly, but must stand as the "Law of the Medes and Persians."

This brings us to that interesting note on the "Boston Ivy" or "Ampelopsis Veitchii," one asks where did those names arise. The latter, we know or believe, that the firm of James Veitch & Sons, London, England, named and placed it upon the market somewhere about 1879 and that it was reviewed in "The Gardeners' Chronicle (English)" in 1880. If the botanist classifies this plant and calls it "Vitis inconstans" it indicates that the botanist is attempting to level the irregular work done by the nurserymen when he attaches his own name to a plant never before on the market, with advertising the sole idea. As for the name "Parthenocissus," "Onlooker" would have us believe that this is a new name. I can well remember in my nursery days in Europe that most of the Ampelopsis were known as Parthenocissus and I think most gardeners with any knowledge at all knew that and any one acquainted with horticulture at all knows and acknowledges that most plants have a synonym, and some more than one.

Parthenocissus quinquefolia, "Onlooker" will find is the synonym for l'itis quinquefolia the "Original Creeper" of the American hedgerows known as Ampelopsis hederacea, while Impelopsis l'eitchii is known as Parthenocissus tricuspidata or l'itis inconstans.

I really think that an able pen as the "Onlooker" has could be turned to a more useful work than bringing up this old, old argument relating to the botanist and strike out in the line of attempting to put a stop to and discourage the use and abuse of common names for plants which every enthusiast and catalogue compiler changes at will; also to encourage the use of the botanical names of plants in the press generally.

#### "Bystander."

#### HENRY A. DREER EXHIBIT AT PANAMA.

The exhibit of Henry A. Dreer, Inc., of Philadelphia, Pa., in the Palace of Horticulture, Panama-Pacific International Exposition, San Francisco, covers an area of 745 square feet and comprises a collection of the choicest species and hybrids of tropical water lilies in cultivation, consisting of the following varieties, known as day-blooming tender water tries:

Nymphaea Panbeyana, N. Grossherrog Lrust Ludwis, N. C. W. Ward, N. Pulcherrima, N. Zangibariensis, N. Zangibariensis a urea, and N. Zangibariensis rosea.

The following, known as night-blooming tender water lilies: Nymphaca Bissetti, N. Dentata Magnifica, N. Dentata Superla, N. Devoniensis, N. Frank Telease, N. George Huster, N. Kewensis, N. O'Marana, and N. Rubra rosea.

Among the miscellaneous aquatics found in the collection may be mentioned: Acorus Japonica Variegáta, Aponogeton Distachyon, Cyperus Papyrus, Eichornia Azurea, Eichornia Crassipes Major, Limnocharis Humbolati, and I halia Dealbata.

THE AQUATIC EXHIBIT OF HENRY A. DREER, IN THE PALACE OF HORIFOLD REP. PANAMAPACIFIC INTERNATIONAL EXPOSITION, WHICH WAS AWARDED A GO D MEDAL.

#### HORTICULTURIST'S INTERESTING VISIT

On the invitation of Mrs. F. A. Constable, of Orienta Point, Mamaroneck, N. Y., the Board of Directors of the Horticultural Society of New York visited her estate on November 1, to view its beautiful autumn setting, the place being noted for its artistic landscape arrangements and magnificent trees and shrubs.

At Mamaroneck the party was met at the station by automobiles and conveyed to the estate. On its arrival the members of the party were received by Mrs. Constable and James Stuart, her gardener, who is one of the directors of the Horticultural Society and also treasurer of the National Association of Gardeners. They accompanied the visitors about the place and pointed out the different interesting features, one of which was the lawns, which are as near perfection as it is possible to attain in our climate.

Mr. Stuart is a great believer in the heavy motor mower and says, if properly handled, it improves the lawns wonderfully where common sense is exercised in not going over them when they are too wet or too dry, and avoiding turning the mower on the same stop too frequently, as this will crush the grass in places.

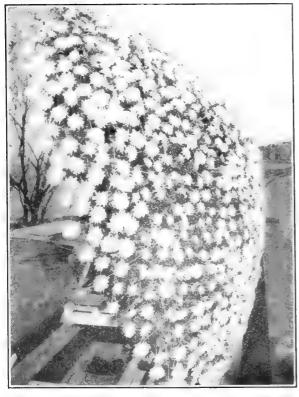

In this favorite section, on the shores of Long Island Sound, the autumn coloring of the trees and shrubbery was magnificent even at this late season. The principal object of the visit, however, was the flower garden, which at this time of the year is a picture such as only nature can paint and is worth coming a distance to see. A garden planted with more than twenty-five hundred hardy Chrysanthemums plants in full flower and harmoniously arranged as to color scheme, is something the average horticulturist does not find opportunity to witness every day.

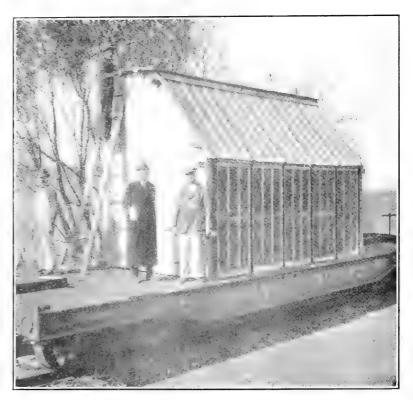

Mrs. Constable takes great personal interest in her flower garden and derives much pleasure therefrom, especially while the Chrysanthemums are in bloom. Her interest does not cease with the flower garden, for Mrs. Constable carefully follows all the efforts of her gardener, Mr. Stuart, which is so essential to the proper development of a well kept place, and if more estate owners and their gardeners came in closer touch with each other many of the gardening problems we hear so much discussed might be eliminated.

After inspecting all that was to be seen of interest about the grounds and in the greenhouse range the party was entertained at luncheon. When its members departed the thought was in the mind of many of them that a little more of this kind of hospitality could be very profitably indulged in among ornamental horticulturists in the vicinity of New York.

The method of culture of the Chrysanthemums grown in Mrs. Constable's garden, as outlined by Mr. Stuart, is rather interesting. The stock plants are kept in a cold frame all winter, not because they are not hardy, but because they would otherwise occupy valuable space in the garden which is required for spring-blooming material. Cuttings are taken at the end of April and potted up when rooted into 2½-inch pots and when ready into 4-inch pots. They are planted in the garden in the early part of August, just after the majority of the perennials are through flowering, and can be trimmed back a little to allow room for the Chrysanthemums. Some of the best varieties that were seen in the garden are A. Barnhard, Border Beauty, Crimson Pride, Etoile d'Or L'Argentuillais, Marie Dufour, Miss F. Collier, Normandy, Perle Chatillonaise, Primevere, Provence and Wells Scarlett.

The illustration on our cover page is the reproduction of a photograph showing a corner of Mrs. Constable's Chrysanthemum garden.

MOVING ONE OF ADOLPH LEWISOHN'S LARGE BUSH PLANTS FROM ARDSLEY, N. Y., TO THE CLEVELAND, OHIO, FLOWER SHOW, UNDER THE SUPERVISION OF JOHN CANNING, SUPERINTENDENT OF THE LEWISOHN ESTATE. JAS. W. CAMPBELL, THE GROWER OF THE PLANT IS SEEN LEANING AGAINST THE "GREENHOUSE ON WHEELS."

# Possibilities in Landscape Forestry

By Arthur Smith, Pennsylvania.

In dealing with forestry problems upon the private estate, both in connection with existing natural woodland, and with reforestation and afforestation, the subject may be approached from two distinct points of view, the aesthetic and the utilitarian; whether the object to be attained is solely to create an artistic landscape, or to secure an adequate return in the future for the capital invested, and the annual

interest and expense incurred.

Unfortunately the average forester never considers a tree from any other standpoint than its present or future value as lumber; he therefore does not make use of the many opportunities which exist of beautifying the ground under his charge. Even with only future profits in view, there is no reason why land scape possibilities should not also be considered, it being quite possible to combine the two; but not, however, in connection with an individual tree. To plant and grow a tree for lumber it should be so placed in relation to others that it will make a straight columner growth, and that its side branches will be pruned away by nature at an early age, so as to produce a straight, clean trunk, free from knots. On the other hand, in seeking to produce a tree with the maximum amount of natural beauty the species is capable of, it must have all the room it requires for the spread of its branches; and while it may, in its early days, be closely surrounded by others for the sake of preserving the ground cover, these must be from time to time removed, so that all its branches may, from the ground upwards, remain, spread and grow unchecked.

A system which has been in vogue among a certain school of foresters in connection with commercial forestry, is to have more or less large, perfectly pure, stands, which are kept clear of underbrush and treated like a field of corn. The only advantages in pure stands from a commercial point of view are, that they are easier and cheaper to establish and that there will

be a reduction in the cost of lumbering.

The principal advantages of mixed stands are, that the natural capabilities of the soil are more fully utilized and a larger number of trees to an acre can be brought to maturity; many species are less subject to damage from various insect and fungous pests in mixture; trees usually develop a better form if mixed properly than when grown pure. From a landscape point of view, mixed stands are of course incomparably superior.

In the comparatively little forest planting that has been done on private estates in this country, some species of conifer have, in most cases, been used. Where the ground is devoid of hardwoods, groups of them should be included in the new plantings; the species chosen being those whose foliage turns to

pleasing hues in the autumn.

The first to change is the Black Gum (Nyssa sylvatica) which puts on a gorgeous, dark red color. This is closely followed by Sweet Gum (Liquidamber styraciffua), the autumn coloring of its five-pointed leaves being not simply a flame but a conflagration; it has brilliant reds and yellows and in addition dark purples, all of which colors are to be seen at one time. It is an ornamental tree not so much used as it deserves, as its foliage all the year, together with its hanging fruit balls, render its characters very dis-

tinctive About the same time come the Dog Woods and the Maples, of the latter, the Red and Sugar are the most brilliant; the Sugar especially in those districts where it turns a brilliant scarlet. When these kinds are in the height of their glory, the oaks are still green; by freely mixing some of the latter, such as the Pin, White, Red and Scarlet species, the effects may be greatly prolonged. In positions close to the point of view, by the margins of drives and trails, the effective bark of the Striped Maple (Acer pennsylvanicum) should not be overlooked, as its bark is copiously streaked with white, producing a very pretty effect, which is the more striking in winter against a background of evergreens. Unfortunately this attractive character becomes reduced as the tree gets old, so one should plant a few young trees now and then.

Where conifers form the bulk of the forest, a year-round brightening effect can be introduced by planting groups of the several forms of White Birch. Their effectiveness is increased by growing them as coppice instead of standards; that is, cutting them down so as to have half-a-dozen or so stems arising from the ground instead of one. Birch also produce the same effect when planted among other hardwoods, as their white bark makes a pleasing contrast with that of those with dark bark. Birch bark does not become white until it is several years old, but the European species, Betula alba, assumes that color sooner than others. For this brightening effect, the Beech is also valuable, as its grey smooth bark is extremely agreeable to the eye when walking through woods at any season.

To obtain a variation in the character of foliage, the Honey Locust and Sweet Gum are very useful; so also are Sassafrass and Mulbery. Then there are the Larches, native, European and Japanese, effective both by reason of their beautiful fresh green when starting into growth in the spring, and the bright yellow of their needles in the autumn. These should be used among hardwoods as well as conifers, but they will not do well under shade.

Another ornamental feature possible in the forest landscape may be secured by the use of trees with prominent flowers, such as Catalpa speciosa, Horse Chestnut, Bird Cherry and Black Locust; the latter however, being in some districts much subject to borers. The most distinctive of all in this respect is the Tulip Tree, especially when branched from the ground so that its large, brilliant, tulip-shaped flowers may be readily seen. For early spring effects the Red Bud, Cereis canadensis, will produce beauteous spots of color.

In more shrubby species, the Sumachs spread their magnificent beauty all through October, to say nothing of the entirely separate character of their foliage at other times. Groups of Witch Hazel add considerably to the many charms of woods in late autumn and early winter, as Whittier wrote:—

Through the grey and sombre wood Against the dusk of fir and pine Last of their floral sisterhood The Hazel's yellow blossoms shine.

Another charming spring subject, which should be in rather large masses to obtain the full effects, is Benzoin or Spice Bush, a relative of Sassafrass. Its bright yellow flowers appear before the leaves, and during late summer and autumn it is covered with red berries. A valuable dwarf red-berried shrub for late autumn and winter effect is Ilex verticillata, Deciduous Holly; it thrives best in rather moist spots. These are just a few of the many delightful native wildlings which, by grouping them in suitable positions, will increase the natural beauties of woodland landscape.

It is not only in newly planted forests that these points should have consideration, but also in old woods, where possibilities in these directions are even much greater. In cases where there is a close stand of old timber, it is impossible to see the woods for the trees, but this condition is rare in districts where one would choose a residential site.

Where any quantity of woodland exists in conjunction with a private pleasure estate, the first thing generally thought of in these days is the cutting of roads through the woods, suitable for automobiles; it is possible, however, to overdo this. Instances may be found where, in a comparatively small area of a hundred acres or so of woods, several miles of wide boulevard have been made. Sometimes these roads may pass through spots where nature has done all that is necessary in the way of supplying landscape possibilities, but when a close, tall stand of trees is cut through, there is nothing but bare trunks to look at. In this latter case infinite possibilities are brought about for ornamental planting by the use of those subjects mentioned above, together with Rhododendrons, Kalmias, native Azaleas, etc., etc., in addition. Making miles of wide drives in a circumscribed area cuts up the woods into small, more or less narrow, blocks; an advantage certainly in getting out lumber; but there is a drawback from the point of view of the bird-lover, as the continual traffic from automobiles scares the more beautiful and rarer birds away. and game birds will not nest under these conditions; further, even with a liberal amount of ornamental planting along the sides of these drives, the aesthetic conditions of the actual forest is not thereby necessarily increased, and, however much there is, little of it can be really seen from an automobile. The true beauties of woodland, whether of large or small area, can only be seen from the inside. We have heard people call woodland commonplace. It is true there are many individuals who can look at the beauties of nature without seeing them, but a walk through any ordinary woodlot will reveal something worth seeing and admiring, if only a little patch of Partridge Berry.

The object of Landscape Forestry is, by the encouragement and increase of beautiful things native to such conditions, to lift woodlands as a whole to a higher plane than is the case when left to themselves or merely thickly planted with pure stands of forest trees. The landscape forester has also to devise means of getting into and going about them as easily as possible. The two best, and in point of fact the only, ways of going about woods and at the same time seeing everything, is either to walk or ride; two methods of locomotion unfortunately almost extinct. For these purposes trails only are necessary, and while some should be wide enough to afford space for the passage of a team and wagon, there is no reason for a lot of cutting and grading. In blazing a trail, some objective should be kept in view; some special point of interest which it is desired to reach. It may be a group of picturesque rocks; a grassy dell which it is intended in the future to further beautify by planting;

some point from whence an outlook may be obtained over a panorama of fine scenery; a grand monarch of the woods in the shape of a specimen tree that has managed to escape repeated lumbering operations. fine trees of great age, with wide spreading branches, are frequently found on old fence lines; from a landscape point of view the more of them there are the better. Where such trees, or others that are likely to reach that condition, exist, any other trees that are now interfering with their natural development or which probably will do in the near future, should be removed; the giving of trees more space must, however, be done gradually or harm may result. As the grand proportions of a well grown tree cannot be seen at their best when standing close to it, approaching trails should be placed and widened out so as to afford a complete view, and, with the gradual removal of surrounding trees, it is possible after a time to have such standing alone in a miniature park.

Other possibilities are: the opening of vistas, through picturesque ravines and glades; or for the purpose of enabling some distant point of interest or scenery to become visible.

A very wide scope in landscape forestry lies in the increase of floral effects not only by the use of shrubs already mentioned but also by means of the thousands of beautiful herbaceous perennials that abound in this country. In all places that have been left to nature these plants are more or less plentiful, the species varying according to situation; sunny or shady; wet or dry; they can be collected from those places outside the range of vision from trails, drives, etc., and massed in suitable positions, thereby creating beauty spots of wild gardening. In addition to flowering plants, the numerous kinds of hardy ferns must not be overlooked, the evergreen species especially add greatly to the charms of strolling through woods durmg the short days of the year. As all native plants possess their individual beauties in varying degrees and manners, the mentioning of any of their names is unnecessary. The writer has treated the subject of native plants somewhat fully in connection with wild and other gardening, in his book on Gardening with Hardy Plants, shortly to be published.

A very interesting and valuable feature may be developed by making one's estate a preserve for native wild plants, many of which are, in some districts, becoming rare, if not extinct; this, not so much because they have been collected and planted in gardens, but because of their destruction by ignorant vandalism.

Where estates are fortunate enough to possess water features, still further possibilities are opened up, especially when these are in the form of a stream fed from springs at higher altitudes. If the water is in the form of pools and swamps, the mosquito problem has to be faced.

It is useless attempting to increase the natural beauties of an estate if these pests mar and prevent the enjoyment of them. When it is possible to maintain a stock of fish in pools, the problem is solved, but in some cases the question of drainage has to be dealt with, so as to do away with stagnant water; needless to say mosquitoes do not breed in running water. Given the fish, a piece of water, in combination with which all the possibilities of aquatic gardening have been made use of, will always be a most charming addition to woodland scenery. Water in woods is also valuable by affording birds a place to drink and bathe, by which an estate is rendered more attractive to them.

(To be continued in December.)

# Work for the Month of December

Conducted by Henry Gibson, New York.

PLOTICITY STIRCES AND TREES.

Every winter sees the loss of trees and shrubs which by the exercise of a little care and forethought might be saved.

Especially is this so with those of an evergreen character. Protecting with leaves and other litter is all very well in so far as it goes, but this we think is not all that should be done. Weather conditions prior to the approach of winter play a not unimportant part in the successful wintering of these subjects. If a prolonged spell of dry weather is experienced previous to the oncoming of severe weather, we are of the opinion that all trees and shrubs should have a thorough good watering, previous to being mulched and otherwise protected for the winter. A very large percentage of trees and shrubs that are winter killed die from the very same cause that many do during the summer, a lack of water at the roots.

Usually neither the heat nor the cold is responsible for it, save perhaps insomuch as they effect the moisture in the soil. There is, as is well known to anyone who is familiar with even the most elementary rudiments of plant physiology, far more transpiration from foliage on clear sunny days, than there is during cloudy weather. It is apparent therefore that when a dry spell has preceded hard freezing weather there is likely to be very little moisture in the soil, whereby the roots can supply the demands made upon the leaves for moisture. To help them do this shading with leaves and other litter has to be resorted to, thus checking the loss of moisture through the leaves, and consequently the demands upon the roots.

The plants are protected from drying winds for the same reason. If rains and snows have saturated the ground with moisture and frost has not penetrated very far in, neither shelter from drying winds nor high sun would be necessary, for the roots would be able to meet all demands made upon them.

One has only to turn to many of our street trees in the summer for an example of the effect that heat, light and drying winds have upon them. Often the foliage on the south side will be scorched while the rest of the tree will be in good condition.

The reason is that the roots have been unable to make good the demands for moisture caused by the more intense heat and light on that side of the tree.

The Yews and other evergreens afford us another good example, this time in winter. Who of us has not noticed dead foliage on the southern side of these evergreens, especially just above the snow line where the intense light demanded more moisture than the roots could supply.

Forest trees are now dormant and any necessary pruning and trimming should be attended to. It is to be feared that on a great many places these trees are left to take care of themselves, with the result that they develop into a shapeless mass of branches. In a perfectly balanced tree all the branches are growing from the center outwards, and at no point do they cross each other. A tree with one main trunk is usually more symmetrical than one that is forked, though the latter will cover a wider area. It is the forked tree that produces the ingrowing branches and these should be cut out to give free access to light

and air. Dead limbs should also be cut out. In cutting off branches the cut should always be made as near the main stem or branch as possible so that in time the wound will heal over. Sawing an inch or two on the under side of the branch will prevent tearing off the bark when the limb falls.

Some very profitable work may be done in winter when other outdoor operations are more or less at a standstill by going over these forest trees with a small hatchet and cutting away dead bark and decaying wood. Cavities may be cleaned out to live tissue and then coal tarred over to prevent fungus diseases from getting a hold of them.

We believe that cleaning out a cavity and tarring it over is preferable to filling with cement. The wounds made by cutting off branches should be tarred over as the work of cutting proceeds, this saving the time and trouble of erecting the ladder and going over them a second time.

#### HARDY SHRUBS.

Deciduous shrubs may still be planted so long as the ground is in condition to receive them. When rain or snow has made the ground wet and heavy it is better to defer this work until spring.

Ground intended for this class of shrubs should be trenched as deep as the soil will allow. Poor soil should be enriched by a generous supply of rotten manure, leafsoil and fibrous loam. In the case of hollies it is advisable to give each one a root bed of three parts fibrous loam to one part rotten manure, The hole for each shrub should be made large enough to allow all the roots to rest in a natural position. Tread the soil firmly about the roots, adding a few spadefuls at a time. Tall growing shrubs should have a stout stake provided to prevent swaying by the wind. Be careful to secure the shrub in such a manner as to prevent damaging the bark. A piece of hose through which the wire is passed will accomplish this.

Established shrubs should have all dead wood cut out during the winter.

#### THE FRUIT GARDEN.

Strawberries, Raspberries, Currents and other small fruits should be mulched well with rotten manure or salt hay before severe weather sets in. When the ground is frozen over an inch or so in depth is the time to do this work.

The strawberries should have all the runners cut away and if the ground is at all baked it would be well to scratch it over a little, but on no account must the roots be disturbed. Raspberries respond to liberal treatment and when mulching put on plenty of manure, and dig it in next spring.

Small trees of apples, pears, peaches, etc., should have the soil pulled up to the base of the plants and when the ground freezes a good mulch of manure should be put on. This treatment may also be extended to the older trees that are bearing with considerable benefit. The old saying "let well enough alone" is apt to prove misleading at times and particularly so when applied to fruit trees. Quite frequently we see trees that are bearing freely almost ruined because they are allowed to exhaust themselves by carrying heavy crops without receiving any compensating supply of manure at the roots. The first sign of deterioration is in the reduced size of the fruit also in growth. A mulch of rich barnyard manure applied even once in two years will greatly assist the trees to maintain their vigor.

Wood ashes are an excellent fertilizer for fruit trees, as are lime and chemical manures containing potash which is an essential plant food for trees of this description. Before applying a mulch the top six inches of soil should be removed and replaced by a mixture of rich loam, wood ashes and lime rubble.

Except on wet soils the manure may be put on now, and a little soil placed over it to prevent birds scratching it around. On wet lands we would prefer to do the mulching in spring, giving instead a dressing of superphosphate of lime and Kanit at the rate of two to four pounds to each tree, according to its size.

All kinds of fruit trees will benefit by this mulching treatment, even those grown in orchards that are sown down with grass. Rain and snow will wash down the food elements and both tree and grass will benefit by it.

#### GREENHOUSES.

Allamandas, Bougainvilleas, Clerodendron, Balfouri and similar deciduous stove climbers require a season of rest. Pruning is also necessary to keep the plants within bounds. If not already done, water should be withheld for a few weeks, then the current year's growth should be cut back to within a few inches of its base. Climbers that are planted out are difficult to dry off, as the roots wander away and usually find sufficient moisture to keep the foliage green for some time later than plants whose roots are under control. The usual custom is to defer pruning until the foliage drops, but with planted-out specimens it is quite safe to prune when the foliage turns yellow. Little or no water should be given until new growth commences in spring. In the case of Bougainvilleas the growth is often so dense that considerable thinning of the main shoots becomes necessary. They cannot flower satisfactorily if they are overcrowded.

#### FOLIAGE PLANTS.

Pandanus Veitchii, Crotons, Dracaenas and other decorative foliage plants always look better after being sponged with soap and water or some good insecticide.

During inclement weather when outdoor operations are suspended opportunity should be taken to go over the plants and thoroughly clean the leaves and at the same time the outsides of the pots. The warm moist atmosphere of the stove causes the pots to become green and when they are in this condition they not only look badly but the plants suffer, because the pots are not porous.

#### GROWING DARWIN TULIPS.

It is very hard for one who has never grown Darwin Tulips to realize the almost unlimited possibilities of the varied uses to which they readily adapt themselves. Their tall, stiff stems raise the beautiful flowers fully twenty to twenty-four inches and withstand the wind so successfully that they may be used for bedding out in the most exposed situation. In fact, they are better adapted for bedding than the earlier sorts as they bloom at a time when the heavy rain and wind storms are past. How many times have the early varieties flowered out only to be beaten down and destroyed by the cold driving rains of early spring? Then, too, the Darwins bloom at a time, in

this latitude, when all flowers are scarce and valuable—Decoration Day.

Some of the brighter sorts make a most beautiful subject for planting amongst shrubbery or the evergreen borders. They are so tall they may be used pretty well back from the edge and so make all the more show, while the earlier sorts being dwarf, can only be planted along the front and edges.

For all bedding I have always advised the use of named varieties rather than the mixtures because by this means only can a striking mass effect be obtained. And at the same time if one does not wish solid colors in one bed it is easy enough to take several varieties whose colors blend and whose style of growth are known and fill the bed so as to get a harmonious color and shape to the finished product.

Last year I went to the trouble and expense of getting one hundred and fifty different varieties of Darwins to plant out so that I could compare the actual relative growth and color of the entire lot. The results more than repaid me, as in no other way could I so familiarize myself with the characteristics of so many sorts. And out of the entire lot there was not one but what was beautiful and would be very valuable in some particular bit of work.—Raymond W. Swett in Modern Gladiolus Grower.

THE NEW CHRYSANTHEMUM "TIGER."

In connection with its campaign of publicity, the management of the Cleveland Flower Show forwarded a number of blooms of a new seedling, Chrysanthemum to President Wilson, at the White House, with a request that he supply a name for it. The President named this new flower, which is a yellow seedling of E. D. Smith & Company, from Chrysolara, "Tiger." Curiosity was immediately aroused as to what relation there may be between a yellow Chrysanthemum and a tiger. Undoubtedly Mr. Wilson had Princeton, the college over which he was president before he entered public life, in mind, when he made his selection of the name, for the tiger is the mascot of that college.

# Electricity and Plant Life

By John Tyrone Kelly, New York.

Developing the well-known economical principle that the stability of a nation is largely dependent on the ability of its soil to support its population, there seems to be an almost imperative duty that our agricultrists principally follow up the successes of certain experiments in the electric stimulation of plant growth. Authorities agree that intensive cultivation is one of the most fruitful methods of increasing the one agricultural output of the soil.

While results to date are quite convincing, the field of Electro Culture, both in Europe and the United States has not yet definitely prescribed what application of electric energy is best suited for the separate seeds of grains, fruits, vegetables and flowers. As a general proposition, however, whether electricity is applied by electric light or directly to the soil, aston-

ishing stimulation in plant life has been shown.

In the United States Dr. Herbert G. Dorsey on the Moraine Farm in the fertile valley of the Miami River, near Dayton, and W. D. Peaslee, in the West, have proved that various applications of electricity have accelerated plant growth. Besides the numerous experimenters in Germany, Professor Lemstrom of Helsingfors University, Finland, has shown that crops are stimulated by a discharge of electricity through the air to the soil, which method is founded on theory and most promising in practice. As a result of his experiences, Professor Lemstrom concludes that the minimum increase yield for all crops under the proper electrified conditions should be about 45 per cent.; for certain crops it may rise as high as 100 per cent. The effects of electricity are not apparent alone in quantity but an improvement of quality and a shortening of the period of growth, sometimes by 50 per cent., is general.

Experiments by Mr. Peaslee were undertaken to establish the result of a current passing through soil containing seeds or roots of plants. These were based on the theory that any results that might be obtained would be due to an enrichment of the soil in nitrogeneous compounds necessary to plant life by the chemical action of the current. Seeds were planted in boxes containing earth from the same mixer and were kept under identical conditions as to temperature, water applied, etc., except that some were subjected to the influence of direct electric currents through the soil while others, used for comparison, were allowed to grow in the usual way. These tests were carried on in a greenhouse and were continued until the nonelectrified plants were ready for transplanting. It was noted that the electrified plants, after transplanting, were hardier and grew faster than the non-electrified. In the radish bed, for instance, where the test was continued until the electrified plants were of marketable size, twelve average sized plants were compared with the twelve largest taken from the non-electrified bed. None of the non-electrified plants were of marketable size, while the electrified plants were. One was one and a half inches in diameter and of fine flavor. Tops were cut and the two beds weighed, the results being as follows:-

Electrified..... 6.75 ounces Non-electrified..... 3.1 " The roots were then washed and weighed, with this esult:

Electrified, average for 25 plants... .468 ounces each Non-electrified, average for 23 plants .098 ounces each This was a gain of 403 per cent. in the average size

of the edible portion of the plant.

On the Moraine Farm, Dr. Dorsey applied to small green house beds for an hour, night and morning daily, an alternating current of 200,000 cycles frequency, at 10,000 volts from a Tesla machine and transformer, consuming about 130 watts. He used a net work of .01-wire at a height of fifteen inches about the bed. He found by weighing various plants a market gain amounting to 75 per cent, for lettuce. The experiment showed that this method gave better results than illumination or earth currents. Almost all the irradiated plants, including radishes, lettuce, beets, cabbages, cucumbers, turnips, melons, tomatoes and parsnips, gave a better growth than those not electrically treated. Beans and peas were only affected slightly, but on the other plants maturity was reached at least two weeks earlier than those not on the electrified ground. Tobacco shows a 20 per cent. gain.

Miss E. C. Dudgeon, of Lincluden House, Dumfries, England, reports experimental work in accelerating plant growth by mercury vapor lamps. Under the influence of the lamp germinating several days and in some cases several weeks, before those sown and grown under precisely similar conditions but not under electric influence. The following table shows the pe-

riod of germination:

	Eb	ectric Lamp.	Gain Electrified.
		Days.	Days.
French beaus		13	21
Carrots		11	26
Cauliflower		6	26
Maize		8	57
Lettuce		6	12
Peas		6	16
Oats			12
Barley		7	12
Wheat			16

Miss Dudgeon stated that all plants responded satisfactorily to the light treatment. Besides the seeds, selections of geraniums, roses, carnations and heliotrope were placed in an electrically lighted experimental house and all showed a marked increase in variety of flowers and good size, color and shape. The rose tree "Belle Lyon-' which had flowers of a previous summer and autumn was pruned in November as bare as a vine. In two weeks it showed leaf, in six weeks buds, and it continued to bloom for months following. Strawberries flowered abundantly and the fruit ripened early. It was proved that there was an increase in the crop of 25 per cent. The lamps were put on about an hour before sunset and kept on for about four and a half hours. The plants were placed on a shelf about four feet from the lamps. The radiation extended over the whole bed. The best results, Miss Dudgeon reports, were those obtained within an eight feet radius of the lamp. As the radiation became less, the growth was less, as could very easily be seen by a casual glance over the beds.

The amount of evidence of the numerous experiments indicates that under the mildly advantageous (Continued on page 511.)

Gain, electrified.... 3.65 ounces, or 111%

ROBERT ALLER, CA'S RESIDENCE, SHOWING THE LAKE SHIP CARMS SMONTHEILES, III

# The Farms, Monticello, Ill.

To take hold of prairie and forest lands and to convert them into beauty spots in a few years is no small task, but this is what was accomplished in a comparatively short period of time on the country estate of Robert Allerton, at Monticello, Ill. "The Farms," as the estate is known, is located on the Sangamon River and comprises about twelve thousand acres of some of the finest farming land in America, situated, as it is, right in the heart of the corn belt.

Evergreens have been liberally employed in the beautifying of "The Farms" and some excellent specimens are to be found, considering the few years the place has been under development.

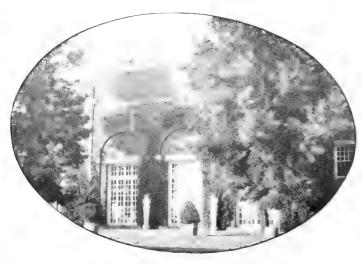

The walled gardens are one of the features of the essate. The fruit garden is surrounded by an eight-foot wall on which are grown trained fruit trees, such as Pears, Apples, Peaches, etc. The vegetable and small

fruit gardens are likewise enclosed in cement walls. Each year "something new" is undertaken in the way

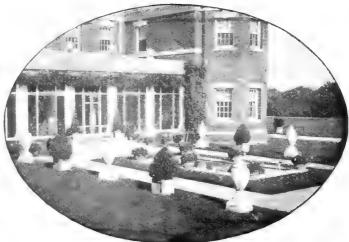

of improvement on the estate so that interest in its development never ceases. At the present time a large Sunken Garden is under course of construction and next spring a large Chinese Pagoda, forty-two feet in height, will be added to the Chinese Mase Garden, which was completed last spring.

Extending along the Sangamon River are more than two thousand acres of natural woodland and last year a system of paths were begun through the woods, of which about four miles are now completed.

Mr. Allerton takes a great personal interest in his beautiful estate. His superintendent, James C. Shield, who has supervised its development for the past eight years, is well known in the gardening profession as an able horticulturist.

#### PRESIDENT'S THANKSGIVING PROCLAMATION.

"It has long been the honored custom of our people to turn, in the fruitful autumn of the year, in praise and thanksgiving to Almighty God for His many blessings and mercies to us as a nation. The year that is now drawing to a close since we last observed our day of national thanksgiving has been, while a vear of discipline because of the mighty forces of war and of changes which have disturbed the world, also a year of special blessing for us.

"Another year of peace has been vouchsafed us; another year in which not only to take thought of our duty to ourselves and to mankind but also to adjust ourselves to the many responsibilities thrust upon us by a war which has involved the whole of Europe. We have been able to assert our rights and the rights of mankind without breach of friendship with the great nations with whom we have had to deal; and while we have asserted rights we have been able also to perform duties and exercise privileges of succor and helpfulness which should serve to demonstrate our desire to make the offices of friendship the means of truly disinterested and unselfish service.

"Our ability to serve all who could avail themselves of our services in the midst of crises has been increased, by a gracious Providence, by more and more abundant crops; our ample financial resources have enabled us to steady the markets of the world and facilitate necessary movements of commerce which the war might have otherwise rendered impossible, and our people have come more and more to a sober realization of the part they have been called upon to play in a time when all the world is shaken by unparalleled distresses and disasters.

"The extraordinary circumstances of such a time have done much to quicken our national consciousness and deepen and confirm our confidence in the principles of peace and freedom by which we have always sought to be guided. Out of darkness and perplexity have come firmer counsels of politics and clearer perception of the essential welfare of the nation. We have prospered while other peoples were at war, but our prosperity has been vouchsafed us, we believe, only that we might the better perform the functions which war rendered it impossible for them to perform.

"Now, therefore, I. Woodrow Wilson, President of the United States of America, do hereby designate Thursday, the twenty-fifth of November next, as a day of thanksgiving and prayer, and invite the people throughout the land to cease from their wonted occupations and in their several homes and places of worship

render thanks to Almighty God.

"In witness whereof I have hereunto set my hand and caused the seal of the United States to be affixed.

"Done at the city of Washington this twentieth day of October, in the year of our Lord one thousand nine hundred and fifteen and of the independence of the United States of America the one hundred and fortieth. "Woodkow Wilson, [Signed]

"By the President.

"Robert Lansing, Secretary of State."

#### SUCCESS OF THE FLOWER SHOWS.

Such glowing reports of the fall flower shows, as appear elsewhere in these columns, assuredly substantiate the contentions made in the past, that the public interest can be aroused in flower shows if proper exploitation is given to them.

What other amusement or attraction is there that will draw twenty thousand persons to its doors an hour for four consecutive hours as was the case at American Museum of Natural History in New York, during the show of the Horticultural Society of New York, or entirely blocking the traffic of a city's prominent thoroughfare, as was the case in Euclid avenue, Cleveland, during one of the day's of Cleveland's flower show. Boston, Chicago and San Francisco all report large attendances, while the "local" shows, those of the small communities all appear to have been more successful than ever this season, both in number and quality of exhibits and in attendance.

The support that the fall shows have received from exhibitors and trade, gives promise that the big spring shows arranged for Philadelphia, New York and Boston will be well patronized by all, directly and indirectly, interested in horticulture.

#### NATIONAL ASSOCIATION OF GARDENERS

JOHN W. EVERITT, President, Glen Cove, N. Y.

OFFICIAL COMMUNICATIONS

M. C. EBEL, Secretary, Madison, N. J.

#### 1915 CONVENTION, BOSTON, DECEMBER 9-10.

The annual convention of the National Association of Gardeners will occur in Boston, Mass., on Thursday and Friday, December 9 and 10.

While the program has not yet been completed in all its details, it is proposed to hold a business session in Horticultural Hall, on Thursday afternoon at two o'clock, adjourning at six o'clock for dinner and reconvening at eight o'clock for the evening session.

Following the disposal of the routine business of the convention and the election of the officers, several interesting papers will be presented by prominent members of the gardening profession. Ample opportunity will be given for a general discussion of each one of them. The subjects of the several papers to be presented are:-

"Îs Gardening a Profession."

"The Gardener's Place in Public Service."

"The Management of Private Country Estates, as Piewed by a College Graduate.

"The Young Gardener's Opportunity in This Country." "Is Co-operation Between Garden Clubs and Garden-

crs' Societies Desirable?

Friday morning and Friday afternoon will be given up to visiting some of the interesting horticultural centers about Boston.

As soon as the convention plans are completed, hotel headquarters selected and program arranged, a notice with complete details will be mailed to each

It is sincerely urged that members in a position to do so make every effort to attend the Boston meeting. All gardeners are invited to attend the convention that they may become familiar with the work that the association is endeavoring to further.

President Everitt has appointed the following local convention committee, W. N. Craig, Duncan Finlayson

and Wm. J. Kennedy.

At the meeting of the Executive Board held in New York City in July it was voted to present the following resolutions as an amendment to the By-Laws at the convention in December for action by the members:

Amendment to By-Laws, Article III, Section I to read, -The annual dues to active and associate members shall be Two Dollars a near, due and payable on January 1st of each year. Members in arrears of dues for more than one year shall be suspended and cannot be re-instated to good standing in the association until their indebtedness to it is paid.

The National Co-operative Committee has received favorable responses from the following societies, to its communication sent out submitting the resolution of the Nassau County Horticultural Society to permit the transfer of a member in good standing from one horticultural society to another

North Westchester Horticultural and Agricultural Society, "Endorsed in its entirety by a unanimous vote of all present.

The Cincinnati Florists' Society "Adopted the resolutions that were adopted by the Nassau County (New York) Horticultural Society.

Connecticut Horticultural Society, "Perfectly willing to carry out the resolution as adopted, and trusts all the societies will heartily support it.

Tuxedo, N. Y., Horticultural Society, "Is in full accord with the movement and willing to render any assistance that is within

its power to help carry it out."

Morris County, N. J., Gardeners' & Florists' Society, "Meets with the unanimous approval of this society, which considers it an up-to-date idea and a great help to the gardener.

Newport, R. I. Hortica fural Society, "Is hearfily in favor of a transfer of members on the presentation of a paid-up receipt for dues to the end of the fiscal year and would adopt such a policy on its being adopted universally by other societies."
Southampton, N. Y., Horticultural Society, "Is heartily in ac-

cord with the resolution and is always ready to co-operate with horticultural societies in any move which is considered an advantage to gardeners."

New Jersey Floricultural Society, Orange, N. J., "Regards it a fine thing for the different societies to affiliate as suggested, and if all societies will get together is quite willing to adopt the idea."

The Los Angeles, Cal., County Horticultural Society, "Adopted the resolution as submitted. Is always alert and ready to further help those interested in horticulture and especially members traveling from one section to another.

Florists' and Gardeners' Club of Rhode Island, "We are willing

New Bedford, Mass., Horticultural Society, "The resolution as proposed was unanimously adopted.

Rhode Island Horticultural Society, "Heartily endorses the resolution and will be glad to put it into effect without reservation. Gardeners' & Florists' Club of Boston, Mass., "Adopted by the meeting unanimously, to the effect that it welcomes all members

of other societies to its meetings and gives them every privilege except that of voting until they have paid dues in the club."

Westchester & Fairfield Horticultural Society, Greenwich, Conn. Unanimously adopted.

Paterson, N. J., Floricultural Society, "Ratified the action of our local committee of the N. A. G. The committee unanimously is in favor of this resolution."

Menlo Park, Cal., Horticultural Society, "The Menlo Park Society adopts the resolution submitted, i. e., The free transfer of any member of any horticultural society in good standing, provided the society from which said member formerly came has adopted a resolution in favor of free transfer of members.

It is known that other societies have taken favorable action but the Co-operative Committee has not yet received official notification

of the same.

Societies that have not yet voted on the resolution will confer a favor on the National Committee by so doing at an early date and advising what action they have taken.

Owing to the small number of papers that have been received for the Essay Contest, which closed on October 1, the winners of which were to be announced at the convention in December, the Essay Committee, which consists of William H. Waite, Chairman, W. N. Craig, Edwin Jenkins, Arthur Smith and Theodore Wirth, has decided to reopen the contest so that gardeners may enter it during the winter months, during which time they have better opportunity than any other season of the year to devote time to the writing of essays.

The contest will be continued until February 1 and the winners will be announced at the association's meeting during the National Flower Show in Philadelphia, in March, 1916. Details of

the contest are given below:

The Essay Committee has selected the following subjects for the essay competition for President Everitt's prize of \$100 m gold. The subjects have been arranged in four classes, as follows: CLASS 1 Prize \$35 gold.

Subject-Horticulture as a Profession, From the Standpoint of a Guidener

CLASS 2 Prize 825 gold. Subject. The Proper Grouping and Culture of Trees, Shrubs, Perennials and Annual Bedding Plants in the Ornamentation of Private Grounds

CLASS 3 Prize \$20 gold.

Subject Preparation of Ground for and General Treatment of Hardy Herbaccous Perennals. Naming a list of species (limited to one hundreds proceeding a succession of flowers throughout the entire season.

CLASS 4 Prize \$20 gold.

Subject How to Secure a Year's Vegetable Supply With the Aid of Cold Frames or Hotheds (but no Greenhouses), Includ ing Soil Preparation.

This essay competition is open to professional gardeners who are engaged in the capacity of superintendents, head gardeners or assistant gardeners.

A competitor is entitled to enter in one class only.

The broadest latitude will be allowed in dealing with each subject.

The essays are limited to 3,000 words each.

The closing date of the contest has been postponed until February 1, 1916, and the announcement of winners has been changed to the Nacional Flower Show, in Philadelphia, Pa., March, 1916.

The Essay Committee will appoint five judges, consisting of three gardeners and two representatives of the horticultural press. Contestants will address William II. Waite, Chairman of Essay Committee, National Association of Gardeners, P. O. Box 290, Madison, N. J., for further particulars.

Secretary, National Association of Gardeners:

I read the article you brought to notice in the October issue, among the notes of the National Association of Gardeners, namely, what some people require a gardener to perform for very meager pay. The party who arote to the association's office has evidently no idea of the status of a real gardener, and confounds his ideas with that of a general handy man who grows a few vahlages, feeds pigs and does the chores around the place. In bringing the above subject to our notice our secretary has shown once more his great endeavor to uphold the dignity of the profession, likewise also studying the employers' interest.

Many people are yet unaware that gardening is a profession calling for a long apprenticeship. The real gardener requires a knowledge of botany, chemistry and engineering besides being a thorough practical grower of flowers, fruit and vegetables.

The National Association of Gardeners is gradually bringing about an improvement in our position, but there are still many drawbacks to surmount; and to cite one or two instances, a multimillionaire two years ago acquired a large estate of 2,000 acres. He built a large range of greenhouses and bought many expensive virubs and trees to adorn his grounds, from a well known nurseryman. He was liberal in every undertaking connected with the leautifying of his place. He employed two chauffcurs to drive his ears, paying each \$150 per month with house, uniforms, vegetables, coal, milk. etc.

When it came to filling the greenhouses, the nurseryman submitted an estimate which totalled several thousand dollars and informed the gentleman that it would be first class stock—also that he could find a suitable man to superintend the entire place for

\$65 per month, and house, etc.

The employer was naturally pleased. A man was secured, but grew discontented with so much responsibility for such meager pay. He resigned in six months. Another was secured by the nurseryman for the same salary. He let a large portion of the plants freeze through not having competent help. The gentleman felt outraged and told the nurseryman he wanted the right man and did not want a \$65 man. He was willing to pay for the best.

The services of a first class gardener were secured and now after two years worry he is paying the same as he has always paid his chauffeurs and the average employer is willing to pay for what-

ever he derives any pleasure from.

I know of another case where a gentleman went to a firm and inquired how much he would have to pay for a good gardener. The man in charge told him \$50 per month and house for a married man or \$50 and board for a single man. He expressed astonishment and was skeptical as to whether he could obtain a real good gardener for that low salary. He was informed that that firm had supplied gardeners for years and had never filled a position higher than \$65 per month and house.

When the National Association of Gardeners becomes better known, as it surely will through the earnest efforts of its officers, the tiffs between man and employer will be less frequent and more satisfaction will accrue to the employer, who having the right man will find his place a source of great satisfaction and worthy of all the expenses incurred in maintaining it.

Our association is descriing of our highest praise and we should all try and help it uplift the craft we belong to, and not grow weary in well doing.

R. W. FOWKES,

Cooperstown,  $\lambda$ , Y.

#### AMONG THE GARDENERS

William Downs, superintendent on the E. S. Webster Estate, Chestnut Hill, Mass., has been confined to the house for several weeks as the result of a severe accident to his right leg. Mr. Downs fell and a three-hundred-pound case came down on his leg. He hopes, however, to be able to be in attendance at the N. A. G. Convention.

The coming convention of the National Association of Gardeners, to be held in Boston, December 9 to 10, is being anticipated with much pleasure by many of the gardeners in and around

Boston, and no stone will be left unturned by the local committee to have a well-attended and successful meeting.

James Brown, formerly of the Dewar Estate, Hyde Park, Mass., has accepted the appointment of head gardener to C. E. Bancroft, Newport, R. I.

Henry Eaton, formerly at the H. F. Sears Estate, Beverly Cove, Mass., is now head gardner to Dan Hanna, Cleveland, Ohio.

Angus McMillian, formerly gardener to Russell Robb, Concord, Mass., has accepted a similar position with Dr. H. F. Sears, Beverly Cove, Mass.

Arthur Griffin, former superintendent of the Geo. M. Landers Estate, New London, Conn., has resigned his position to accept a position of superintendent at "Greystone," Yonkers, N. Y., the estate of Samuel Untermyer.

Thomas Hatton, former superintendent of "Greystone," the Untermyer Estate, Yonkers, N. Y., has accepted the position of superintendent on the Geo. M. Landers Estate, New London, Conn., succeeding Arthur Griffin.

Thomas Hambleton has secured the position of head gardener on the Henry C. Phipps Estate, Spring Hill, Roslyn, N. Y.

Charles Ernest Carman, former gardener on the Henry Wardwell Estate, Springfield Center, N. Y., has accepted a similar position at Eastover Farms, Oyster Bay, N. Y., succeeding Henry Gibson.

Arthur Jackson, formerly gardener to Mrs. Moulton, West Orange, N. J., is now gardener to A. E. Newbold, Chestnut Hill, Pa.

David Frazer, superintendent of the H. C. Frick Estate, "Clayton," Pittsburgh, Pa., has re-opened the greenhouse range which has been closed for some time. This range supplies the cut flowers for Mr. Frick's New York mansion, and his summer home "Eagle Rock," Prides Crossing, Mass.

- J. Gary Curtis is recovering from a serious attack of pneumonia which has confined him in the West End Hospital, Pittsburgh, for the past month. Mr. Curtis has been superintendent of the George Westinghouse Estate since last April, incidentally continuing his duties as forester of the boroughs of Sewickley, Wilkinsburg and Donora.
- J. F. Zimmerman, superintendent of the William Carr Estate, Point Breeze, Pittsburgh, is building an additional house to the greenhouse range.

The large conservatory at "Greenlawn," the Henry J. Heinz Estate, Pittsburgh, was opened to the public while the Chrysanthemums were in bloom. The greenhouses, which are under the management of Aloysius A. Leach, made a fine showing, the public being no less interested in the hothouse fruits and vegetables, which are grown in the Heinz greenhouses, than they were in the fine blooms of Chrysanthemums on exhibition.

William Reid, gardener on the Colgate Estate, Orange, N. J., was recently appointed on the Board of Managers of the New Jersey Agricultural College, located at New Brunswick, N. J.

Alexander Thompson, of the Moses Taylor Estate, Mt. Kisco, N. Y., has accepted a position as gardener on the Edward Bayer's Estate, of the same place, and will assume his new duties on December 1.

Arthur Rose goes from the Bayer Estate, Mt. Kisco, N. Y., to the position of superintendent of the Lewis Estate, Saugatuck, Conn.

#### AMERICAN ASSOCIATION OF PARK SUPERINTENDENTS

OFFICIAL COMMUNICATIONS.

EMIL T. MISCHE, President, Portland, Ore.

R. W. COTTERILL, Sec.-Treas., Seattle, Washington.

#### **DUES ARE DUE**

By the time this issue reaches you, every member will have received a copy of our 1916 Year Book, Membership Roster, Constitution and By-Laws, etc., accompanying which is a Due Bill for 1915-16 dues.

Now do not pigeon-hole this bill for payment at a later date, but send in your remittance at once. It won't cost any more, and it will make possible the prompt payment of the bills of the Association. The officers want to get out some useful literature during this fiscal year, but do not propose to incur any expenditure beyond available funds in hand to pay for same.

#### OUR NEW MEMBERS.

Inasmuch as a majority of our membership did not attend the San Francisco convention and as an unusually large number of new members were admitted, space will be devoted this month to a brief summary of these new members, by way of introduction to the membership.

#### SENIOR MEMBERS.

ALBERT BIESCHKE, Noroton, Conn. Superintendent of "Great Island," an immense private estate, open to the public, where natural woods are being transformed and developed. Mr. Bieschke has been on this work for the past ten years, and for three years prior was connected with the South Park system of Chicago.

HEXRY W. BUSCH, Detroit, Mich. General Superintendent of Parks and Boulevards, which position he has held for the past six years, and for four year previous was Secretary and Deputy Commissioner.

W. C. CLAYBAUGH, Fresno, Cal. Superintendent of Parks at Fresno for the past four years, and for two years previous at DeKalb, Ill.

JAMES O. CONVILLE. Portland, Ore. Has been connected with the Portland park system for the past eight years, advancing from Assistant Superintendent to Superintendent in 1914.

CHARLES W. DAVIS, Memphis, Tenn. Has served for nine years in the Memphis Park Department, beginning at the bottom, and is now Superintendent. Memphis made a strong bid for the 1916 convention.

HENRY H. ELBERS, Buffalo, N. Y. Director of South Park Botanic Gardens, and formerly Superintendent of Humboldt Park. Seventeen years at Buffalo and a total of thirty-two years' experience in horticulture.

J. G. MORLEY, San Diego, Cal. Superintendent of San Diego park system for past four years, and in charge of planting and landscape work of the San Diego Exposition.

JOSEPH M. PAIGE, Pomona, Cal. Superintendent of Parks for the past six years, and prior to that was connected with the Missouri Botanical Gardens at St. Louis,

WM. R. READER, Culgary, Canada. Superintendent at Calgary for the past three years, and has had life experience on private estates in England and Canada.

DAVID F. ROY, Marion, Mass. Superintendent of "The Moorings," one of the best-known estates in New England. Mr. Roy has been located here for thirty years.

FRANK SHEARER. Los Angeles, Cal. Superintendent of Parks for the past six years, and for three years prior was Superintendent at Denver, Col.

JACOB UMLAUFF, Seattle, Wash. Head Florist for Seattle Park Department for the past four years, and for ten years prior was in charge of parks operated by the Seattle Electric Company.

#### JUNIOR MEMBERS.

WM. R. HANCOCK, Fergus Falls, Minn. Superintendent of Parks for the past four years, and previous landscape experience with nursery firms.

JOHN D. McEWEN, New York, N. Y. Superintendent of Parks for Queens Borough for past year. Previous experience in charge of private estates.

H. L. McGILLIS, Seattle, Wash. Park Engineer for past four years. Previous engineering experience with city engineering department at Seattle, and with C. M. & St. P. Ry, at Chicago.

WALLACE R. PIERSON, Cromwell, Conn. Superintendent of

Cromwell Gardens, a semi-public private park. Mr. Pierson had the misfortune to be compelled to submit to an operation for appendicitis upon his arrival at San Francisco and missed attendance at the convention.

#### ASSOCIATE MEMBERS.

WILLIAM ALLEN, New Orleans, La. Secretary of West End Park Commission. Mr. Allen was an important factor in securing the 1916 convention for New Orleans, and promises a bunch of new members and a banner time for our next convention.

JAMES F. DAWSON, Brookline, Mass. Landscape Architect connected with the firm of Olmsted Brothers for the past twenty years, and is known by park men all over the country.

CLOVIS DeGRELLE, Montreal, Canada. Landscape Architect of twenty years' experience. Specialist in rustic bridge work, notable examples of which are in LaFountaine Park, Montreal, and in parks of Bucharest, Roumania.

EVERETT C. LYLE, Bellingham, Wash. Landscape Engineer. Connected with Bellingham municipal work for past seven years.

DONALD McLAREN, San Francisco, Cal. Landscape Engineer connected with Panama-Pacific International Exposition, Son of our Honorary President.

DANIEL McRORIE, San Francisco, Cal. Landscape Architect. The man who came to the Newburgh-New York convention in 1914 and walked off with the 1915 convention for San Francisco, and who this year proved to be the champion single-handed entertainer of the session.

RALPH T. STEVENS. Berkeley, Cal. Landscape Gardener, University of California, for past three years, and has had ten years' practical experience with nursery firms.

#### PERSONAL AND OTHERWISE.

Our member, Laurie D. Cox, formerly of Los Angeles, now of Syracuse (N. Y.) University, has recently completed a study of the street tree situation in New York City, and a comprehensive report on the subject will be published shortly. Mr. Cox writes that he will send a copy of this report to every member of our association, a courtesy that will certainly be appreciated.

Lionel Evans, superintendent at Youngstown, Ohio, writes that since reading the reports of the San Francisco convention and trip, that he and his wife are kicking themselves because they passed up the convention this year. Mr. and Mrs. Evans are a genial couple who have graced recent conventions with their presence, and they promise not to err again.

Wm. R. Hancock, superintendent at Fergus Falls, Minn., has a position which only calls for employment six months of the year, hence is on the lookout for something more permanent. Mr. Wirth, of Minneapolis, vouches for Mr. Hancock's ability, and any information concerning an opening will be appreciated by Mr. Hancock.

Miss Charlotte Rumbold, for many years secretary of the St. Louis Park Department and in charge of playground work in that city, has been caught in the "political jam" and has been displaced. Commissioner Dwight P. Davis retired some months ago, and thus two of the best-known and most efficient park executives in the country are out of public service. We certainly hope they will continue in recreation work somewhere, as their permanent retirement from the work would be a distinct loss.

The standing which our association has in educational circles has been demonstrated during the last few months by calls on the secretary from the leading universities and libraries of the country for copies of our Bulletin No. 12, Concessions and Privileges in Public Parks, and our convention proceedings, all of which goes to prove that the opinion of the practical man, on the job, is desirable.

Wallace R. Pierson, who, while attending the San Francisco convention, was stricken with appendicitis and spent several weeks in a sanitarium, has fully recuperated and is on the job again at Cromwell, Conn., feeling like a new man and loud in his praises of treatment received at San Francisco.

The secretary is very anxious to make this personal column interesting, but in order to do so he must hear from the membership. When you send in your dues take the time to write a few

lines about what you are doing and how you are getting along, or any bright ideas you may have, and the secretary will probably find something in what you have to say that will be of interest to the other members. There is and should be a fraternal spirit among our members, and we all like to hear about the other fellow.

#### CONVENTION TRIP OF PARK SUPERINTENDENTS.

(Continued from September.)

Tuesday, August 17. At 9 o'clock the party left the hotel to board the steamer for a trip on the beautiful Bay of San Francisco, up the Alameda, Oakland and Berkeley side, past Richmond and Point San Pablo into San Pablo Bay, where the great Mare Island Navy Yard is located; then back, past Point San Pedro and San Quentin, Angel and Goat islands, returning to the hotel for a restful afternoon. After dinner all sojourned to the Hotel St. Francis ballroom, where we were the guests of the S. A. F. at a reception. Dancing was indulged in until about 11 o'clock, when all present were formed into line, to be received formally by the president of the S. A. F., Mr. Patrick Welsh, and Mrs. Welsh. Refreshments were served, and about 1 o'clock our party wended its way back to the Hotel Stewart, much pleased with a most enjoyable evening.

Wednesday, August 18.—This day was spent by the men in the business of the convention and by the women in writing let-

ters, shopping, etc.

Thursday, August 19. At 9 a. m. all boarded the cars for Oakland Ferry, the bay being crossed by the Creek route. On landing, we found that the park officials and several city fathers had provided autos, and away we went up the Mountain Drive, through groves of eucalyptus trees, with their spicy perfume, past beautiful Lake Merritt, with its wonderful municipal boat house, and then on to the Ostrich Farm, where ostriches in all their feathery array were seen; on to Lakeside Park, with its wonderful view and magnificent oaks; Peralta Park, with its municipal auditorium, athletic field and recreation grounds; Mosswood Park, with its deer paddock; Idora Park, the largest amusement park in the West; then up Diamond Canon to the heights overlooking the city and bay; then out to Berkeley, with its beautiful residences, geranium hedges and immense fuchsias. Here is located the University of California and the Greek Theatre, seating 7,000, endowed by William Randolph Hearst, where we saw Margaret Anglin in rehearsal; and then to Piedmont Park, where a delicious luncheon was served under the great trees collected from all over the world and planted by the late Frank C. Havens. We listened to speeches by the City Fathers and park officials, and then went to the Botanical Gardens, then took the ferry back to San Francisco. The evening was spent by the men of the party as guests of the Elks Club, where a stag smoker entertained from 8:30 to midnight. The ladies of our party attended the theatre as guests of the Park Board.

Friday, August 20. - The autos were at the hotel at 9:30, ready to take us around the city of San Francisco and its wonderful parks, Golden Gate, made from sand hills by the wizard McLaren. Here water falls, lakes and glens have been created where there was nothing but sand before, drives, athletic fields, stadium and the Portals of the Past; then to Lincoln Park and along the coast drive by the side of the great Pacific. As we passed along, we saw an aeroplane flight. Then we went on to the mountains. where we left the chill of the ocean side for the warm, congenial sunshine of the mountain pass; to Burlingame, to San Mateo, where we visited the wonderful Desablo Estate; then on up the mountains, along Spring Valley Water Reservation to a most delightful grove, where luncheon was served in the open. We were told it was just as delightful on a Christmas day. down the mountains by a different route, over the Crystal Spring Dam, built of 157,000 cubic yards of concrete, 176 feel wide, 176 feet high and 43 feet thick, costing \$1,500,000. After an uneventful ride home we reached the hotel at about 6 p. m.

Saturday, August 21. We left the hotel at 9:30 and took a bus to the Fair grounds, where the party separated into small groups. Here again we saw the work of the wizard McLaren. whose genius had transformed chaotic conditions into beautiful flower beds and gardens. As we passed through the main gate we were impressed with the wonderful evergreen walls and flower-Then we went on into the South Gardens, with 3.000 ing vines. feet of horticultural beauty and architectural grandeur, across the gardens to the Tower of Jewels, glittering in the sun, toward the west, to the Palace of Horticulture, down the Avenue of Palms to the Court of Four Seasons, past the Italian Towers to the Court of Flowers. We visited the Agricultural, Education and Horticultural Halls, then the buildings of Fine Arts, New York State, Oregon, Hawaii, where we enjoyed the weird singing and music of a native troup; then on through the Liberal Arts. State of California and The Netherlands buildings and out to the Marina, where lay the United States battleships Oregon, Santiago and North Carolina; then by electric chair for a tour over the grounds and to tea in the Chinese Tea Garden, and then to the Zone, where the beauty of the lighting is beyond description. For the small sum of ten cents we were permitted to view the wonderful picture of the nude. Stella, painted by Nain in 1893, and said to be worth one quarter million dollars, and so on, mid maze and wonder, till sheer exhaustion drove us home to the hotel and to bed, to dream of all the mental photographs our minds had taken. And so the first day at the Fair goes down in history.

Sunday, August 22. A well-carned day of rest. Some of us

Sunday, August 22. A well-carned day of rest. Some of us must needs keep up our records and go to church in the morning and to the Adler Sanitarium to see our friend Pierson in the

afternoon.

Monday, August 23. Men visiting triends; women shopping and theatre.

Tuesday, August 24.—Shopping and packing in the morning kept all busy. The afternoon saw us preparing for the concinuation of our journey south, and at 7 p. m. we left the hotel

and boarded the Southern Pacific train.

Wednesday, August 25. All up early to view sunny Southern California, the train making short stops at Burlingame, Palo Alto, San Jose, Santa Barbara, Oxnard, Santa Susana, and passing through Chatsworth Tunnel. We arrived at the Hotel Haywood, Los Augeles, at 10 a. m. The balance of the morning was spent in arranging railroad tickets, and after luncheon we boarded the Rapid Transit electric cars for Santa Monica Beach. We passed the military academy, poultry farms, cattle ranches, oil wells, beautiful homes of the bungalow type, with wonderful geranium hedges, the great eucalyptus trees everywhere; through Culver City, with its palm bordered streets and roadsides, and Venice City, on the Lagoon. We arrived at the beach, along which we strolled for miles and where hundreds of beautiful women bathed in one-piece suits, and whose swimming and diving equal that of the best men swimmers. Our appetites having been sharpened by the sea air, a number of the party elected to dine at Nat Goodwin's Pier Pavilion, surrounded on three sides by the ocean. As night came on, the full moon rose up out of the water and scattered its silvery rays a-dancing on the ocean. About 9 p. m. we boarded the electrics for the trip back to the city, and as we passed along the illuminations of Venice City Beach were viewed with admination.

Thursday, August 26. We left the hotel at 8:30 and boarded

the autos, together with the S. A. F., to South Park, according to programme. On Figueroa street we rode between two rows of magnificent palms, through Chester, where we saw a grove of giant bamboos. At the Doheny Estate we visited the wonderful palm house, 75 x 200 x 60 feet high, with an immense swimming pool in the centre of it. Continuing our journey, we passed the celebrated Hershey Arms, reputed to be the most exclusive hotel in America. A little further on, up on the Hollywood Mountain, we saw the Romish shrine, where the city people of that faith go up to worship. Onward we rushed into Pasadena, and up the mountains, winding in and out for two hours, making over four hundred turns to all points of the compass and at many of them we came on the most wonderful views of the fertile valley below, with its farms and the city stretched out as far as the eye could see. In many places the cliffs along which we rode dropped down thousands of feet. At last we came to the top, and an awe-in-piring scene presented itself. Then came the descent, which, if anything, was more hazardous than the ascent. When about three-quarters of the way down the mountains, we suddenly halted, at about 12:30, in a beautiful grove, where the Spanish barbecue, consisting of the following, was served:

Billee Fare Cabeza Tatemada Frijoles Conchili Carnero Azado Salza

When all had eaten and appeased their thirsts, we again boarded the waiting antos, at 2 p. m., and off we went to the Busch Gardens, a most picturesque, park-like estate. Although the name of the place is associated with a certain beverage, none was to be had, so we again embarked for the Huntington Estate, where refreshments were served to a very thirsty crowd. Here we saw a wonderful caeti garden, with hundreds of varieties of rarest plants. When all had been refreshed, internally and optically, we again sounded the Klaxtons and were off for the hotel, via Eastlake and Elvsian Parks, arriving about 6 p. m., tired, dusty and hungry, but satisfied that we had been well poid for the trouble and much enhanced in knowledge. Most of our party went early to bed, to be up ready for an early start for San Diego.

Friday, August 27.—Left Hotel Haywood, Los Angeles, at 8:30, all aboard the Santa Fe Railroad. As we pulled out of the station we ran along the river bed where four mule teams were carting out sand. It is said that at this place a despondent man jumped from one of the beautiful concrete bridges in an attempt to commit suicide, but merely got himself all dusty. We afterwards crossed several dried-up rivers and as rain is unknown for eight months in the year, irrigation is absolutely necessary

everywhere. Here we passed through miles and miles of orange groves planted in light, sandy soil, and saw train loads of sugar beets, dozens of oil wells, and great herds of cattle. Down the Santa Anna Valley we rushed, to the level farm lands, with thousands of acres of beans, coin, sugar beets, melons, etc. The soil is rich, black loam, worked with eight-horse plows. Then we came to San Juan and the ruins of the mission of San Juan Capistrano, the first established by the Franciscan monks, where the road leads down to the Pacific. For thirty miles or more we rushed along the shore, with the waves breaking almost at the rails, with sharks and porpoises playing in the ocean, and auto parties camping along the beach, a most picturesque sight. We stopped at Del Mar Bathing Beach long enough to take on another engine to help push us up the cliffs along which we ran, at a height of several hundred feet, crossing over canyons which, in the rainy season, are rushing mountain torrents.

Again we came to miles and miles of beans, then down the cliffs to the city of Ocean Side, and then on to San Diego, arriving at 12:50, where we took autos to the Hotel St. James. hurried wash up and lunch, we were again bundled into autos by the park officials at 2:15 p. m., and off to Mexico. about sixteen miles, through a most wonderful assortment of groves of oranges, lemons, dates, figs, apricots, olives and grape fruit, passing through National City, Chula Vista and Palm City, where are located the great sea salt works, the salt being obtained by evaporation. Then we passed the horders into Mexico, and were held up and searched by a Mexican officer in quest of arms or ammunition. When we arrived at Tia Juana, our destination, we attended a small fair and saw open gambling by men and women at roulette, dice, cards and slot machines. The side shows tlaunted signs inviting the public, at "two bits" (25 cents), to see a nude woman pose. There was fortune telling, mind reading, etc., and when you think of San Diego, Cal., within sixteen miles, like Heinz, with its fifty-seven varieties of churches, it is easy to realize why the Mexicans are so little respected. As we again entered dear old U. S. A. we were held up and searched by a customs official, looking for dutiable goods purchased in Mexico.

Then we went on to Coronado Beach, with its unique tent city of over two thousand palm roofed houses and beautiful white hotel; across the ferry and out to Point Loma, to witness a most glorious sunset and a bay view claimed to be equal to Venice or the Bay of Naples. Then we went on to the Caves and Sunset Cliffs and back, in the cool of the evening, to the Hotel St. James, arriving at 7:30 tired, dusty, but rejoicing in having spent one of the most enjoyable afternoons of our trip.

Saturday, August 28. At 9:30 a.m., all aboard the park autos. Under the guidance of Superintendent Morley we visited the Old Town and Ramona's marriage place, a most romantic old mission, containing curious antiques, a stage coach, the old Wishing Well, etc. Many dated back to 1700. Then we visited the Stadium, a remarkable structure 630 feet long by 300 feet wide, built by the Park Department at a cost of \$150,000. We went next to the public playgrounds, then through residential streets lined with beautiful palms and flowers and on to Balboa Park, consisting of 1,400 acres, half of which are undeveloped, except for a most complete road system. Next to the Fair grounds, where a delicious luncheon was served in the Administration Building, and after lunch our party separated to view the grounds and buildings, each to its own taste; the organ recital, the myriads of tame pigeons, which settled on our heads and shoulders, causing much

merriment.

The beauty of the buildings and grounds in some way even exceeded the San Francisco Fair although not so extensive. The model bungalow, the model farm, etc., were most interesting. About 6 p. m. all sojourned to the hotel for a nunch-needed rest.

Sunday, August 29.—We left San Diego, the train pulling out at \$140 a, m. After an uneventful ride we went back over the Santa Fe to Los Angeles, arriving on time at \$12.50. We jumped into autos and rushed over the Viaduet to the Salt Lake Ronte of the San Pedro, Los Angeles and Salt Lake Railroad, leaving at \$1.25 p, m., passing Pomona at \$2.18. We saw great groves of walnut trees and fields of sunflowers, acres and acres of fig trees and fields of teasels, and gradually climbed up into the mountains, which are covered with sage, with here and there, little bunches of cacti and dwarf palms. By 6 o'clock we were again in the valley, where many Gueca palms were seen. Belind, the mountains shone, a beautiful purple, in the sunset. During the night we crossed the nountains of Nevada and went thrown a dozen tunnels.

(Space would not permit carrying the story to its completion in this number. It will be concluded in the December issue.—Editor.)

#### THE DRIFT OF MODERN RECREATION.

By Towix Dr. Greot, California, (Continued from September.)

Then I think park boards have found that children of all ages and both sexes do not get along well in play. That is to say, boys and girls play very well together up to possibly nine or ten years of age, but above that age it seems as though the girls need a separate place if they are to have a really good time, and likewise the boys. They need a different kind of play space, if they are to let alone the little children. The problems are solved greatly when some division of space is worked out—spacing the children off if you please.

Then, I think the boards are seeing the necessity of having real recreation in the playgrounds, or else getting out from under the supervision altogether. I believe there are many possibilities there that have not been worked out. Every community is becoming more and more alive to this supervision—the women's clubs, chambers of commerce, the schools and the like.

Why cannot the park boards say: "We will supply the areas. We will give you our rules and regulation, etc., now, you furnish the kind of supervision that you want." Mr. Manning of Baltimore, has done something of the sort for years. He supplies the physical equipment, the ground and up-keep, etc., then the playground commission supplies the supervision which is demanded there, but which we could not always call adequate.

And here again, it seems to me, there is a larger problem to be met in the park development. I wonder if we have not reached the time when large parks which were developed many years ago-it is only some thirty or forty years ago that we started real park development, but we have in all large cities parks, which when they were begun, were in the suburbs; now I wonder if the time has not come for developing more parks in the outskirts to carry on these fine planting schemes, and these nature systems and other wonderful things in our park development, and utilize the older parks for recreation facilities. There is this crying need of facilities every year, more tennis courts, more swimming pools, more row-boats. more everything that represents facilities for this active recreation. I wonder if we have not reached the time when we must give considerable thought to using parks in the interior of the cities for this active recreation; giving these parks architectural treatment. rather than this beautiful landscape treatment, of course never giving up certain landscape treatment; but couldn't we carry the people into the parks by subways, etc. Certain parks are now fighting companies who wanted to go through them with their electric lines. Why not suggest the tunneling under the parks and carrying the people in street care under the parks and letting them out at places where we can develop a beautiful architectural feature in the parks and bring these people into the very center of the parks; and why should we fail to allow people go through in automobiles? People, if they had parks at periphery of the city, could reach them with Fords everyone has a Ford these days—consequently these parks at the edge of the city are more easily reached than were the present parks in the earlier years. See how much we could gain in areas of tennis courts, and see how much more these parks in the outskirts would in truth become recreation grounds where you could step upon everything.

I think we have got to squeeze some of the water

out of the stock—that this park is a place of rest. Go into any one of these parks today and you think of safety first, always, because you can hardly go anywhere without encountering automobiles and flying missles. They are not restful places. So we should hike out to the periphery of the city and go into a larger development than we have heretofore.

Now in the schools: There is a very distinct drift there. Architects and school people generally are coming to realize the necessity for planning the school yard as they are now planning the school buildings. Intensive development has struck the school architect and the school with man and marm. No longer are people satisfied with this one sided sort of yard or grounds. A large assembly place and several class rooms are now had.

Now, if that drift is followed—and I believe it will be very rapidly in the succeeding years—the school people are going to take hold very vigorously of playgrounds for children and the park boards will take hold of the supervision of children's play in the parks and the school boards will do more than before and will find the utilization of the school yards after school is one way in which the homes can be brought into the schools. Parent Teachers' Associations have been formed in every community and every effort made to bring its schools and families together, but the more the parents that discuss the modern curriculum etc., the more at sea they seem to be; and the parents and children are not getting together very readily. · But this leisure time, what to do with the children from the time they get out of school until they go to bed, is the real problem, and here the school sets up the playground and children will be registered for play as they are registered for music, drawing or anything else, in the class room, and the parents will then know the children have been cared for after school as well as in school; and I believe that is the drift.

What is the drift with reference to the playground commission? It seems to me the playground commission will become the recreation commission; that they will give up the treatment of problems of play for general classification of the grammar grades, and will go into the dance halls, municipal camps, bathing beaches, etc., rather than play of smaller children. I believe we are going to make a fine distinction in the future between children and adults. Adults take pleasure in some sort of recreation. Children take play They have just one business in life—play. They live to play and they play to live. Play will be for children and recreation for adults, and the question of play for children is going to be tremendously inclusive as an educational problem; therefore, the educators are going to take a larger hand, thus leaving the park commission to direct more largely the activities of the people at large.

Now, these various co-operative methods. I believe we have stood aloft too much in various communities The school board has said, "This is our business; it is none of your business." To the Park Board, and the Playground Commission has said the same thing.

And so co-operation must enter into all municipa' endeavor. Playground and school and park groups must get together and cut out this overlapping and duplication of expense and the like. The tax-payer is complaining more and more every year, and economy is the watchword, and we are going to progress through co-operation. Now, that is, I mean the Park Board will have certain functions and the other two boards the same, and they will supplement each other and not duplicate each other in facilities and expenditures.

I believe very often we could have one recreation superintendent in the cities. San Francisco is bringing the school-board and the playground commission together, and the State Normal School in this same circle. There is a fine illustration of co-operation. So, in the personnel there are various ways of co-opera-

This tendency is abroad: To make recreation pay its own way. You have had animated discussion as to what should be paid for. I think once we establish that play is for children-and we are going to work out certain facilities in a certain manner. We shall not make them pay, but when it comes to amusements and diversion, and so forth, for those facilities we are going to make them pay. I don't mean make them pay. I believe the public will demand the right to pay. pay. His majesty, the American citizen, likes to pay his way. Take the young man who only earns seven or eight dollars a week, and what does he do? He goes down the great white way and insists upon buying his recreation; and that is one reason why our parks are not more largely used, they are too free.

Certain things should be charged for, and people

would patronize them more than they do.

Now the whole world is on a strike for higher pay and less work, and that means we are going to have more leisure and less work. The mass of people have more leisure than ever before, perhaps.

Running parallel with that law was another one that of limited consumption. We thought a few years ago that we should wear the old suit for years; that everything should be made to go as far as it would. We insisted that the wife make and remake her

gowns, over and over again.

We do not believe in limited consumption. We believe in unlimited consumption, and every one is consuming just as much as they can. We have discarded the suit of clothes. The wife has discarded her hat and the old gown, and we are getting new ones. We discard the automobiles of 1915 that we may get one of 1916, and the most significant thing is this: we have become the most unlimited consumers of commodities and of play in the world. All the countries of Europe have kept quite steady in their recreational pursuits. We go out to buy our play for five or ten cents, and the kind we buy often condemns us.

We like to buy our leisure, therefore, isn't it reasonable to give some consideration to letting people pay their own way for recreation? Not for play, because that relates to children, and children should not be made to pay a fee for any phase of their play, it seems to me, but the adults and the working people like

to buy their own play.

We have seen in a good many communities a wheel tax—and do you notice the people who own automobiles pay this tax quite readily, particularly where the law says all money coming in for this tax must be spent for the repair and upkeep of good roads? The man who owns an automobile pays an automobile license and for the things in connection with that machine, yet pays this tax quite cheerfully. Why? Because the law says this tax will be paid out for his further pleasure.

Now, if we work our hardest for park development and just tell the people the more money we put into the parks will be for their greater pleasure, they will flock to them, and respond, as they have not responded

before.

## Our Native Birds' Protectorate

Under the Direction of the Committees on Bird Preservation and Propagation. National Association of Gardeners, L. H. Jensen, St. Louis, Mo., Chairman. American Association of Park Superintendents, Hermann Merkel, New York, Chairman.

#### ENEMIES OF HOUSE BIRDS.\*

Birds have numerous enemies from which a careful landlord will try to guard them. Among these is the English sparrow, whose persistent attacks too often drive more desirable birds away from their nests and from the neighborhood. European starlings, which at present are not distributed beyond a narrow strip of the Atlantic coast region centering about New York, are to be condemned for their pernicious interference with native house birds.

Cats and large snakes are enemies of birds, the former perhaps killing more birds than any other mammal. Trees and poles supporting houses should be sheathed with tin or galvanized iron to prevent these enemies from climbing to the nests. Squirrels give more or less trouble by gnawing houses, eating eggs, and killing nestlings. Red squirrels in particular, have a very bad reputation in this respect, and many experimenters keep their grounds free from them. Some regard flying squirrels as but little better than red ones. Even gray and fox squirrels are occasionally troublesome. It is not necessary, however, that bird lovers should wage indiscriminate warfare against all squirrels. It is far better to adopt the rule never to kill a squirrel unless there is reason to believe that it has acquired the habit of eating eggs of young birds; the result will probably be that not more than one red squirrel in fifty nor more than one gray squirrel in a hundred will have to be killed. Where squirrels are numerous they give more or less trouble by gnawing and disfiguring houses. This damage may be prevented, however, by covering the parts about the entrance with tin or zinc.

A means of attracting birds about human habitations is to furnish an abundance of food, preferably in food shelters. If one is unable to make shelters that will protect food in all kinds of weather, the food may be fastened to trunks or branches of trees or scattered in sheltered places on the ground. A decided advantage in having shelters, aside from that of protecting food, is that they may be placed where the birds can be watched conveniently. When shelters are used the birds are first baited by placing food, such as suet, seeds, or cracked nuts, in a conspicuous place, and then led by degrees to enter the inclosure.

The location of a bird house or food shelter has much to do with its success, for the reason that birds have decided notions as to proper surroundings for a dwelling. Martins prefer to breed near houses, but not within 20 feet of trees or buildings. Bluebirds are inclined to select orchards or pastures having scattered trees. Wrens, thrashers, and catbirds live in thick shrubbery. Robins like trees with sturdy trunks and branches. Titmice, nuthatches and most of the woodpeckers are woodland species, although flickers and red-headed woodpeckers are more at home among the scattered trees of roadsides and pastures. Song sparrows frequent weedy swales and brush fences. Swallows do not enter woods so that a house would be as attractive to them in one open place as in an-

other. The eastern phoebe, the black phoebe, and the house finch, while not limited to the haunts of man, are noticeably partial to them. Crested flycatchers, screech owls, barn owls, and sparrow hawks are governed more by convenience than by taste; although normally inclined to hold aloof from man, they have in many instances reared their broods in close proximity to dwellings. Barn owls, true to their name, accept suitable quarters in builidings without hesitation.

Before erecting bird houses one should first determine the kinds of birds to which his premises are adapted. The question usually next arising is as to the number of birds than can be accommodated. Unless grounds are large, it is generally useless to expect as tenants more than a pair of each species, except martins. However, the singular intolerance shown by most birds during the breeding season to others of their kind does not operate between those of different species. A dozen different kinds of birds will pursue their several modes of hunting and raise their families in the same lot, but rarely two of the same sort. The fact that birds are more tolerant toward strangers than towards relatives was well illustrated by an observation made recently by the writer in New Mexico. A one-story tool house 10 feet square had nailed to three corners of its roof rough bird houses made from packing boxes. One was occupied by violet-green swallows, another by western blue birds, and the third by English sparrows. A still more remarkable association of different species has been reported by Otto Widmann, of St. Louis, Mo., who once had a pair each of flickers, martins, house wrens and English sparrows nesting simultaneously in the same house. Of all our house birds, martins alone are social. The fact that there is a limit to the possible bird population on any given tract must be taken into consideration. When the probable tenants have been decided upon, the selection of sites is in order, for the site often decided the style of house that is to occupy it. In the final placing of bird houses, care should be taken to have them face away from the winds prevailing in stormy weather. The strongly developed homing instincts of birds can be relied on to attach them to the neighborhood where they first saw the light, and the identical pairs which nest in the houses provided for them one year will often return the next season to enjoy the same bounty and protection.

Statement of the ownership, management, circulation, etc., required by the Act of Angust 24, 191. If THE GARDENERS CHRONICLE OF AMERICA, published monthly at New York, N. Y. for October 1, 1915. Editor, M. C. Ebel, Madison, N. J.; managing editor, M. C. Ebel, Madison, N. J.; business manager, Geo. A. Burniston, Madison, N. ## SCHENLEY PARK (PITTSBURGH, PA.), SHOW.

While nobody seemed in the least at fault there was unmistakably a bad mistake in the date announced for the big annual Chrysanthemum show in the Phipps Conservatory, Schenley Park, Pittsburgh, Pa., this month. (All, from Superintendent George W. Burke, of the Bureau of Parks, to the reporters on the daily papers, refused to shoulder the blame.) lay in that the respective papers reported that Mr. Burke had announced the opening to be on October 7, whereas it was really on the thirty-first; this being further emphasized by big notices on the front of the Pittsburgh Railways' cars. Notwithstanding, Foreman John W. Jones had his celebrities appear promptly as he had originally planned for, "the last Sabbath and day in October." They were all there-Mrs. J. Purroy Mitchel, Reine Wilhelmine, Mrs. Gilbert Drabble, Mrs. H. J. Jones, S. A. Watt, W. Mease, Rider Haggard, Lord Kitchener and the others, big and little, but it goes without saying made their premiere appearance before a painfully small audience. However, in reply to the newspaper and street car summons, the masses appeared almost by magic on the morning of the seventh, continuing until the doors closed at five o'clock; each day since having a most gratifying quota of appreciative visitors from not only the rank and file, but from the higher walks of life.

Without exception this year's exhibition was the most beautiful of any in the existence of the Schenley Park 'Mum shows. Three large houses were devoted exclusively to the big blooms, which were bordered by the smaller varieties. The two larger houses were arranged in mounds, which showed the most harmonious color effects, the light seeming almost to melt into the darker and richer shades. In striking contrast was the smaller apartment, which the admiring "Layman" could liken to only a huge mixed Dutch bouqust, so varied and brilliant was the massing, with, however, not the slightest suggestion of confusion.

The Phipps Conservatory in West Park, North Side, opened as scheduled on October 31, the enthusiasm of the thousands of visitors reflecting the greatest credit on Foreman James Moore and his men. There were eighty-five varieties of 'Mums shown this year, with more than 5,000 single stemmed specimens, with about 1,500 Pompons in myriads of blooms of every color.

## HORTICULTURAL SOCIETY OF WESTERN PENNSYLVANIA.

The Horticultural Society of Western Pennsylvania was organized on Friday evening, November 5, in the lecture hall of the East Liberty branch of Carnegie Library. About thirty-five private and landscape gardeners were present and elected the following officers to serve during the coming year: David Fraser, president; William Allen, vice-president; Thomas Edward Tyler, secretary, and William Thompson, Jr., treasurer. Mr. Fraser has been the head gardener on the H. C. Frick estate, "Clayton," for the past nineteen years; Mr. Allen is superintendent of the Homewood Cemetery; Mr. Tyler is the orchid grower for Charles D. Armstrong, and Mr. Thompson is in charge of William Penn Snyder's Sewickley Heights estate, "Wilpen Hall." There was also a committee appointed to draft resolutions composed of the following: Messrs. Fraser, Allen, Ernest Guter, Walter James

Richard Beatty Mellon grounds; Mr. James is with W. Henry R. Hilliard, and Mr. Weisenbach is head gardener for William Larimer Mellon.

Brief and suggestive talks were given by William Thompson, Sr., who has charge of the Craig estate in Sewickley; Aloysius Anthony Leach, of H. J. Heinz's "Greenlawn"; Henry Fortune, a landscape gardener; Messrs. James and Fraser. It was decided to have the society meet semi-monthly in the East Liberty branch, the dates to be decided at a special meeting to be held shortly. At this session an executive committee will also be appointed. The membership list is not to be limited to professional men, but will be open to amateurs and all persons interested in horticulture. There will be monthly exhibitions at the hall, but special endeavor is to be focused on a Chrysanthemum and Spring Show on a large scale, which will probably be held in Exposition Hall or Duquesne Garden.

While the majority of the private gardeners hereabouts are affiliated with the Florists' Club of Pittsburgh, for some time it has been deemed advisable to have an independent organization, owing to such subjects as lawn-making, vegetable gardening, various annuals, etc., being of no vital interest to the commercial florists, and therefore being practically precluded at their sessions. A number of wealthy horticultural amateurs, especially greenhouse owners, are much interested in the new organization and undoubtedly will lend practical support to the enterprise. Notably among these are Charles D. Armstrong and Richard Beatty Mellon.

#### ALLEGHENY COUNTY GARDEN CLUB

The annual meeting and election of officers of the Garden Club of Allegheny County will be held on Friday afternoon, November 26, at the home of Mr. and Mrs. Finley Hall Lloyd, near Shields. The club is having a full schedule this month, the members being entertained on the fifth by Mr. and Mrs. William Larimer Mellon, of Darlington road, and on the nineteenth by Mr. and Mrs. William Larimer Jones at the Pittsburgh Golf Club.

## INTERNATIONAL GARDEN CLUB.

The International Garden Club opened the fall season at its club house, Bartow Mansion, Pelham Bay Park, New York City, on Thursday, November 4, with a lecture on "Hardy Chrysanthemums," by Charles H. Totty, Madison, N. J. An audience of about one hundred and fifty members and friends listened to Mr. Totty's interesting talk which was illustrated with subjects of early flowering and pompon varieties. After the lecture tea was served.

On Thursday, November 18, Mr. Alexander Cummings, formerly in charge of the Rose Gardens, Elizabeth Park, Hartford, Conn., now with the A. N. Pierson, Inc., Cromwell, Conn., will lecture on "Outdoor Roses." His lecture will follow a luncheon which will be served at the club house on noon of that day.

Mrs. Charles F. Hoffman, president of the International Garden Club, is very enthusiastic over the progress that this new organization is making, and declares it will fulfill all it has undertaken to accomplish even sooner than its sponsors at first anticipated. The club house is completely furnished and next spring will witness great activity about the grounds, which are to be laid out in many gardens.

#### ELECTRICITY AND PLANT LIFE.

1 Continued from page 499.

conditions electric stimulation has increased crop yields of many kinds. The favorite method of application has been to date to cause a high tension discharge to the ground from insulated conductors arranged over the growing plants. It has also been observed that the positive discharge gave better results than the negative one.

Electric stimulation appears not only to affect vegetation but has a similar effect on living creatures. Experiment in connection with chicken raising shows that young chickens subjected to an electrified atmosphere for a certain interval each day develop not only greater vitality and a consequent reduced mortality but also show a much more rapid growth under the same feeding or an equal growth with a more limited diet. On an Oregon farm a stock raiser has wired his sheep pens with Mazda lamps. The light of the pens induced the sheep to feed early in the morning and late at night, besides their regular diet during the day, which served to fatten them up for the market weeks in advance of the ordinary sheep shipping day.

Much more experimentation is needed in Electro Culture so that definite principles may be set down and the effects of electric stimulus be assured with the accuracy obtainable in all scientific and engineering work.

In many experiment stations data is now being collected by engineers on the staff of the Society for Electrical Development on this subject, to be published during "Electrical Prosperity Week," November 29 to December 4, when the record of electrical achievement for the last twenty years will be heralded in every city and town of the United States.

#### AMERICAN ROSE SOCIETY.

The Executive Committee of the American Rose Society held a meeting in New York City, President Pennock presiding. The matter of the annual bulletin with the proceedings for 1915 was gone over, with the plan of making improvement in this publication, and the J. H. MacFarlane Co., of Harrisburg, made a proposition to issue the same in a much better form than heretofore, and this proposition was accepted, and the same will come out after the first of January, embodying the transactions of the year with colored illustrations.

The matter of cost of affiliated membership was gone over with some detail. At present the affiliated membership is ten cents for each member, and after careful consideration it was moved that the associate membership be changed from ten cents to twenty-five cents per member; this change to be put into effect January 1, 1916.

The premium list for the exhibit of 1916, to be held in Philadelphia at the National Flower Show from March 25 to April 2, was submitted and gone over carefully, covering roses in pots and tubs, table decorations, blooms by commercial growers and blooms by private growers. The total amount of premiums to be awarded is \$2,500.00.

Mr. C. T. Tansill, of the Washington Test Garden Committee tendered his resignation, and it was moved that Mr. Wm. F. Gude, of Washington, D. C., be appointed to fill the vacancy, and Mr. Gude has accepted the position. BENJAMIN HAMMOND, Secretary.

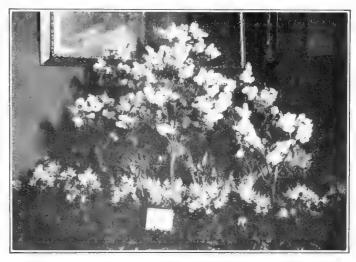

#### HONORING JOHN McLAREN

That was a happy thought of the authorities at the San Francisco Exposition when they gave one day of their program to honoring John McLaren, the maker of Golden Gate Park, and who has been instrumental in adorning the exposition grounds. In doing honor to this able horticulturist, the San Franciscans have unwittingly paid a high compliment to the gardeners' art, for although so many people in these days are too squeamish to acknowledge that a "landscape engineer" (save the mark) is a "gardener," that is just what he is, first, last and all the time. Or shall we be merciful and say that that is what he ought to be but too often is only the "engineer," and leaves the real gardener who has to follow him, and who has to try and grow plants and shrubs in some of the impossible places he has planned—he leaves the latter with a rich legacy of difficult problems or cultural impossibilities. If all the "engineers" knew as much about the real gardening part of the business as they ought to, there would probably be many more cosy and effective gardens up and down the land. The work of John Morley at San Diego deserves to be similarly honored to John McLaren's.

#### FLOWERING LILACS IN NOVEMBER.

The exhibit of flowering lilacs at the show of the Horticultural Society of New York, made by John Scheepers, and awarded a silver medal attracted a considerable amount of interest and proved one of the attractive displays of the show.

These plants, packed in a way to insure their remaining dry, were put into cold storage last December and after

GROUP OF FLOWERING THEACS AND SPIREAS ON EXHIBITION IN NOVEMBER AT THE HORTICULTURAL SOCIETY OF NEW YORK LATE, SHOW

being retarded for eleven months, they proved better than lilacs which arrive fresh from Europe and are then forced.

The trusses were larger than those from fresh lilacs; one plant bore as many as fifty-nine perfect trusses, while they were grown from only regular size potgrown plants; a remarkable thing is that after being for five days in a dark corner of the overheated museum, barely watered, they were in as perfect condition when they left the museum for the Plaza Hotel, where they are now on exhibition, as they were when they left the greenhouses where they were grown.

Not all the plants so treated and retarded flowered in perfect condition; a considerable percentage would not flower at all, but Mr. Scheepers hopes to succeed one hun-

dred per cent. next year.

## NATIONAL ASSOCIATIONS

National Association of Gardeners. M. C. Ebel, secretary, Madison, N. J.

Society of American Florists and Ornamental Horticulturists.

John Young, secretary, 54 West 28th st., N. Y.

American Carnation Society. A. F. J. Bauer, secretary, Indianapolis, Ind.

American Dahlia Society. Joseph J. Lane, secretary, 11 West 32d st., N. Y.

American Gladiolus Society. Henry Yonell, secretary, Syracuse, N. Y.

American Peony Society. A. B. Saunders, secretary, Clinton, N. Y.

American Rose Society. B. Hammond, secretary, Fishkill, N. Y.

American Sweet Pea Society. H. A. Bunyard, secretary, 40 West 28th st., N. Y.

Chrysanthemum Society of America. Charles W. Johnson, secretary, Morgan Park, Ill.

Women's National Agricultural and Horticultural Association. Miss Margaret Jackson, secretary, Engle wood, N. J.

## LOCAL SOCIETIES

Bernardsville Horticultural Society. W. G. Carter, secretary, Bernardsville, N. J. First Monday every month, Horticultural Hall, 7:30 p. m., Bernardsville, N. J.

Boston Gardeners' and Florists' Club. William N. Craig, secretary, Brookline, Mass.

Third Tuesday every month, Horticultural Hall, Boston, Mass., 8 p. m.

Cleveland Florists' Club. Frank A. Friedley, secretary, 95 Shaw avenue, East Cleveland, Ohio. Second Monday every month, Hollenden Hotel, Cleveland, Ohio.

Cincinnati Florists' Society.
Alex. Ostendorp, secretary, Cincinnati, Ohio. Second Wednesday every month, Jabez Elliott Flower Market.

Connecticut Horticultural Society. Alfred Dixon, secretary, Wethersfield, Conn. Second and fourth Fridays every month, County Building, Hartford, Conn., 8 p. m.

Detroit Florists' Club.
R. H. Wells, secretary, 827 Canfield avenue,
Detroit, Mich.

Third Monday every month, Bemb Floral Hall.

Dobbs Ferry Gardeners' Association. B. Harms, secretary, Dobbs Ferry, N. Y. Last Saturday every month.

Dutchess County Horticultural Society. Herbert G. Cottan, secretary, Wappinger Falls, N. Y.

Second Wednesday every month except May and June, Poughkeepsie, N. Y.

Elberon Horticultural Society.

George Masson, secretary, Oakhurst, N. J. First Monday every month, Fire Hall, Elberon, N. J., 8 p. m.

Essex County Florists' Club. John Crossley, secretary, 37 Belleville avenue, Newark, N. J.

Third Thursday every month, Kreuger Auditorium.

Florists' and Gardeners' Club of Holyoke and Northampton, Mass.

James Whiting, secretary, Amherst, Mass. Second Tuesday every month.

Florists' and Gardeners' Club of Rhode Island.

William E. Chapell, secretary, 333 Branch avenue, Providence, R. I. Fourth Monday each month, Swartz Hall.

Gardeners' and Florists' Club of Baltimore.

N. F. Flittin, secretary, Gwynn Falls Park, Sta. F. Baltimore, Md.

Second and fourth Monday every month, Florist Exchange Hall.

Gardeners and Florists of Ontario. Geo. Douglas, secretary, 189 Merton street, Toronto, Canada.

Third Tuesday every month, St. George's Hall.

The Horticultural Society of New York. Geo. V. Nash, secretary, Bronx Park, New

York City.
Monthly, irregular, May to October, New
York Botanical Garden, Bronx Park, New York. November to April, American Museum of Natural History, 77th st. and Columbus ave., New York.

Houston Florists' Club.

A. L. Perring, secretary, 4301 Fannin street, Houston, Texas.

Meets first and third Monday, Chamber of Commerce Rooms.

Lake Geneva Gardeners' and Foremen's Association.

Raymond Niles, secretary, Lake Geneva, Wis.

First and third Tuesday every month, Oct. to April; first Tuesday every month.
May to Sept., Horticultural Hall.

North
Westchester County Horticultural and Agricultural Society.

Lenox Horticultural Society. John Carman, secretary, Lenox. Mass. Second Wednesday every month.

Los Angeles County Horticultural Society. Hal. S. Kruckeberg, secretary, Los Angeles, Cal.

First Tuesday every month.

Massachusetts Horticultural Society. William P. Rich, secretary, 300 Massachusetts avenue, Boston, Mass.

Menlo Park Horticultural Society. Percy Ellings, secretary, Menlo Park, Cal. Second Thursday each month.

Minnesota State Florists' Association. Gust. Malmquist, secretary, Fair Oaks Minneapolis, Minn. Third Tuesday every month.

Monmouth County Horticultural Society. Harry Kettle, secretary, Fairhaven, N. J. Fourth Friday every month, Red Bank.

Montreal Gardeners' and Florists' Club. W. H. Horobin, secretary, 283 Marquette st. First Monday every month.

Morris County Florists' and Gardeners' Society.

Edward J. Reagan, secretary, Morristown, N. J.

Second Wednesday every month, except July and August, 8 p. m., Madison, N. J.

Nassau County Horticultural Society. Harry Jones, secretary, Glen Cove, N. Y. Second Wednesday every month, Pembroke Hall, 7 p. m.

New Bedford Horticultural Society. Jeremiah M. Taber, secretary, New Bedford, Mass.

First Monday every month.

Mr. Nunn, gardener to Mr. S. Stern: William Kettlewell, gardener to Mrs. Pope.
In the chrysanthemum classes the display was the best ever seen on the Pacific Coast, and among the varieties which attracted the most attention were Odessa, William Three Notes of Steins Not Over 15 Inches Collection of 24 varieties; growers of over 2,500 square feet of glass not eligible Mrs. Payne Whitney, first: D. E. Oppenheimer. Nerisa, Flamingo, Ivy Gay, Sisa wath, Elberon, Mrs. G. Drabble, Mrs. A. S. Watt, Chrysolara, Lady Hopetoun,

#### NEW YORK HORTICULTURAL SOCIETY'S SHOW.

The annual fall exhibition of the Horticultural Society of New York, held in the American Museum of Natural History, New York, November 4 to 7, was the most successful ever held by that society, both in display of magnificent plants and blooms and in number of attendance. Nearly a hundred and ninety-five thousand people viewed the show during the four days it was in progress, while between one and five o'clock on Sunday afternoon more than eighty-eight thousand visitors inspected the show

Superintendent John Canning, of the Adolph Lewisohn Estate Ardsley, N. it would seem, has reached the limit in size of chrysanthemum bush plants, for were he to produce any larger ones they could not enter the building. His largest plant on exhibition this year was nearly seventeen feet in diameter. His standard plants attracted much attention and gave promise of great possibilities in training chrysanthemums

in different shapes.

The collection from Duke's Farm, Somerville, N. J., staged by A. A. Macdonald, gardener, and occupying a space of thirtyfive feet in length by fifteen feet in depth was a most unusual and interesting one. On either side of a fountain, with its nymphs sending the water upward, were Mrs. Morris Rutherford, secretary, Warrick, grouped the various hot house fruits grown at Duke's Farm and exhibition vegetables. Banked behind these groups were chrysanthemums and roses embedded in foliage plants of many varieties. It was a splendid exhibit and was awarded the Society's gold medal, which is its highest prize.

A group of lilacs and spireas in flower, staged by John Scheepers and Co., deserves notice and for which a silver medal

was awarded.

The judges were Walter Angus, John D. Urquhart, Alexander Michie, Robert Walker, James Ballentine and George H. Thompson. The premiums awarded follow:

#### AMERICAN INSTITUTE SHOW.

The annual show of the American Insti tute, New York City, opened on Wednesday. November 3.

The exhibits of cut blooms of Chrysan themums, Roses and Carnations were of excellent quality. There was also a display of bush and standard grown Mums, and plants of the latter as single-stemmed speci mens in pots. In addition, there was a display of Begonia plants.

The exhibits of vegetables and fruit

formed an interesting display.

The judges were E. Dailledouze, Peter Duff, Wm. Turner, Geo. Middleton, Alex MacKenzie and J. G. McNicoll - The man ager was W. C. Rickards, Jr.

## SILVERSterling & Plate

## Silver-Plated Compotiers In Many Beautiful Designs

The artistic piece illustrated is  $5\frac{3}{4}$  inches high and the diameter at the top is 914 inches. Made of Nickel Silver, heavily plated, in a richly cut-out pattern, making a most effective gift, as well as providing a desirable selection for the purchaser's own table.

This Compotier is just one representative example among scores of beautiful new and classic designs shown at the INTERNATIONAL Store. An equally broad variety of Compotiers in Sterling Silver also on display.

Whether it is an artistic gift, simple or elaborate, or practical pieces of Silver for the home, the International Silver Company's stocks are always broadest and most interesting.

You are invited to visit the store at your convenience, to look over the exhibition, regardless of whether you have a purchase to make at the time or not.

## International Silver Company

Succeeding The MERIDEN Co. Established 1852

49-51 West 34th St., through to 68-70 West 35th St., New York

Exposition was held in the headquarters of trophics, all of which were of a practical that institution, New York on

1 .0812. The exhibition was aximately one of chrysanthenums, in which there were ten classes. Probably the most interesting of the exhibits were the table securitions for which there were ten entries. The settings tor the tables were supplied by the Hotel Biltimore and the Grand Central Pestanout and this teature of the show made a splen-

did display. In connection with the show, Charles H. Totty, of Madison, N. J., lectured on the afternoon of the first day on "Hardy Chrysanthemmus." The lecture was well at COUNTRY LIFE EXPOSITION SHOW.

The first show of a series of shows to fessional gardeners. The show was pro-

#### THE BOSTON AUTUMN SHOW.

The November Show of the Massachusetts Horticultural Society has ceased to be called a "Chrysanthenaum Exhabit," as the "Queen of Autumn" fails to attract people as it did a decade ago. Big blocms and specimen plants had their inception in Massachusetts but have steadily declined in favor of late years, more particularly the big blooms, but plants of more moderate size undisbudded were largely shown, the singles, anemones and pompons having largely displaced the big varieties in favor. Orchids, begonias, carnations, roses, fruits, vegetables and hardy evergreens were all better than ever before seen here at a Fall Show, and table, mantel and other decorations were numerous. Such an exhibition attracts the general public far more than one of chrysanthemums only.

In the cut chrysanthemum classes the lead-

In the cut chrysanthemum classes the leading prize winners were: D. F. Roy, gardener to H. E. Converse; E. H. Wetterlow, gardener to Mrs. Ledand; James Nicol, F. J. Dolansky, W. W. Edgar Company, and W. I. Russell.
D. F. Roy's blooms were very fine; his winning twenty five were: Meudon, Cheltoni, His Majesty, Wm. Meade, James Fraser, Wm. Turner, Madison, W. Woodmason, Marquise de Venosta, Mrs. Foote, Earl Kitchener, D. B. Crane, Adele Griswold, F. S. Vallis, Mrs. G. Drabble, H. F. Converse, G. Hemming, Nerissa, Elberon, Nagoya, Pockett's Crimson and Poughkeepsie.

Rectisic.

For specimen trained chrysanthemums William Watson won for six plants. For single specimens of the several color prizes chiefly went to this exhibitor, W. C. Rust, gardener to Miss C. S. Weld, A. M. Davenport, and G. L. Stone (A. E. Griffin, superintendent). The last named captured the silver medal for the finest plant in the show with a fine specimen. E. H. Wetterlow had the twelve best specimens of single flowered varieties. F. P. Putnam took first in class for cut pompons, anemone and singles with grand collections.

William Thatcher, gardener to Mrs. J. L. Gardner, won first for a two hundred-toot cir-

anemone and singles with grand collections.

William Thatcher, gardener to Mrs. J. L. Gardner, won first for a two hundred-root circular group of chrysanthenums and foliage plants. For the one hundred and fifty-foot group of flowering plants he used white and colored speciosum lilies largely.

Orchids were grandly shown. Donald Mc-Kenzie, gardener to E. B. Dane, and J. L. Smith, gardener to A. W. Preston each secured a first class certificate for Cartleya Mariae. Henry Stewart, gardener to Miss C. Warren, showed a grand cancidium Rogersi, several of the spikes carrying 250 flowers each. Geo. F. Stewart, gardener to Mrs. I. C. Lawrence, had a finely flowered Cattleya Trianaci, an extra early type.

numerously shown, Begonias were numerously shown, W. C. Rust winning, half dozen Loraines were four feet across. A. M. Davenport was first with six beautiful plants of the brilliant Mrs. Heal begonia, William Downs, gardener to E. S. Webster, showed Mrs. Heal begonias a yard across; he also secured a first class certificate for begonia optima a fine orange colored variety.

Table and mantel decorations brought out a new competition each day, nearly all the lead-ing Boston retailers competing. For the best table of a private gardener Duncan Fit gardener to L. Anderson, was first and Thatcher second. gardener Duncan Finlayson,

Thatcher second,
Fruits were largely shown and of splendid quality while finer vegetables were never seen at a fall show here.
For 12 varieties there was a strong entry. Edward Parker, gardener to Oliver Ames, woo with Paris golden celery, New York egg plant, pure culture mushrooms, Sutton's Exhibition Russes, Speaker, Speake pure curture musirooms, Sutton's Exhibition Brussels Sprouts, Snowball cauliflower, Dan-ver's improved carrots, Chinese Giant peppers, Ailsa Craig onion, hollow crown parsnip, May lettuce. White Spine cucumber, Lister's Prolific tomato.

The show was beautifully arranged, and the attendance, especially on the closing days. was record breaking.

#### THE LENOX (MASS.) SHOW.

The fifteenth annual Flower Show of the Lenox (Mass.) Horticultural Society, was held in the Town Hall on October 26 and 27 Although the number of exhibitors was less than in the previous two or three years, the hall was well filled and all the exhibits were of the highest class and very tastefully arranged: In the center was a large circular group of miscellaneous plants for effect slown by Grand Foster egrd., E. Jenkins. One of the lealing features of the show was the magnificent group of orclads exhibited by A. N. Cooley, of Pittsfield (orchid grower, Oliver Lines)

Cut Chrysanthenums were well shown, the winners in the leading classes being Giraud Foster who won the society's cup for the best vase of 10 blooms with the variety Mrs. G. L Wiggs. A silver cup offered by W. H. Walker, Great Barrington, for the best six blooms in the show was won by Mr. Cooley. Roses and Carnations were well shown, the winners in Roses being F. E. Lewis, Ridgefield, Conn. (gdr., W. Smith); C. Lanier and G. Foster.

In Carnations, Mrs. Griswold and Mrs. R. Winthrop were the winners in the leading There was the usual keen competiclasses. tion in the vegetable classes, G. Foster winning the special prize offered by Mrs. W. E. S. Griswold for the best collection of 18 kinds by the narrow margin of  $1\frac{1}{2}$  points. Carlos de Heredia (gdr., G. H. Thompson), was placed second. Both exhibits were of a very high class. For 12 varieties, one point separated the collection from Mrs. R. Winthrop (gdr., S. Carlquist), and C. Lanier (gdr., A. H. Wingett), in the latter's favor. This prize carried with it the silver cup offered by R. &. J. Farquhar & Co. The special prize offered by Peter Henderson & Co. for the best 10 varieties of Potatoes was won by C. Lanier. There was a good show of fruit. Lord & Burnham Co.'s prize for 12 dishes of Apples, distinct, was won by A. Swift, of W. M. Salisbury, of Pittsfield, won the silver cup offered by Hitchings & Co. for the best two bunches of Grapes.

There was a good attendance on both days A vote of thanks is due to all exhibitors and the committee of arrangements who helped to make the event a success.

J. FROMPTON, Asst. Secretary.

#### THE MADISON (N. J.) SHOW.

The twentieth annual flower show of the Morris County Gardeners' and Florists' Society opened at Madison, N. J., October 28 This society holds a record for its long, uninterrupted series of flower shows and they have now progressed to a point where they are considered the society event of the county: consequently the attendance is notably large and yet exclusive, as Madison

W. C. Rust and C. D. Sias won in the private gardeners' carnation class. Carnations were of superb quality as shown in the commercial airce.

The awards were as follows:

Thirty-six flowers, six varieties, six of each-

Thirty-six flowers, six varieties, six of each—First, Wm. Duckham, superintendent for Mrs. D. Willis James, Madison, N. J.
Eighteen flowers, six varieties, three of each—First, Ernest Wild, superintendent for C. W. Harkness, Madison, N. J.; second, Jas. Fraser, superintendent of the O. H. Kahn estate, Morristown, N. J.

Chrysanthemum plants in flower, arranged with foliage plants for effect, on a space not exceeding fifty square feet—First, Robt. Tyson; second, John Downing.
One specimen chrysanthemum plant in flower, in pot or tub, any color—First, Peter Duff; second, W. J. Carter.

In the vegetable classes the first prize was won by Robert Tyson; second, by James Fraser, in a class calling for collection of vegetables, twelve distinct kinds, arrangement to count. James Fraser scored first in the class calling for six kinds, and won numerous prizes in the individual vegetable classes. Other prize winners in this section were Thos. Dorner, superintendent for Mrs. A. H. Tiers, Morristown, N. J., and Louis Barkman, of Morristown.

The principal prize-winners for exhibits fruits were: S. M. Post, of Bernardsville, N. J.: John Downing: Wm. Reid, superintendent for S. M. & A. Colgate, and Jas. Lindabury, superintendent for R. D. Foot, Morristown, N. J.

The stage was decorated, as in former years, by Chas. H Totty. This year the decorations consisted of seventy or more varieties of single mums, pompons, the well known Caprice mums and autumn foliage.

The first prize in the table decorations went to D. Golding, superintendent for Mrs.

Ridley Watts, Morristown, N. J.; second, Wm. Duckham; third, David Francis, super intendent for Mrs. Chas. Bradley, Convent.

X. J.
The judges were as follows: Eugene Dailledouze, Brooklyn, N. Y.; Frank Witney, Fishkill, N. Y.; Harold Vyse, Devon. Pa.: Peter Duff, Orange, N. J.; Wm. Tur ner, Bernardsville, N. J., and Wm. Brock, Tuxedo, N. Y.

#### TARRYTOWN (N. Y.) FLOWER SHOW.

The seventeenth annual flower show of the Tarrytown (N. Y.) Horticultural So-ciety was held in Tarrytown, November 3 to 5 inclusive.

The principal exhibitors were Finley J. Shepard, Joseph Eastman, Ennl Berolzheimer, Mrs. F. E. Lewis, William B. Thompson, Adolph Lewison, Mrs. S. Hermann, David L. Luke, Mrs. S. Neustadt, Hugh Hill, Mrs. I. N. Seligman, Richard Delafield, Paul M. Warburg, etc.

The society's silver medal was awarded to Finley J. Shepard in class 1, tor seedling Croton Roxbury. Certificate of merit was awarded to Mis. A. McEwen for an exhibit of standard seedling single chrysanthemums; also certificate of merit to Jacob Ruppert for six standard chrysanthemums Miss Cornelia A. Ruppert. Cultural certificate was awarded to Finley J. Shepard for Phoœnix Roebelenii.

The judges for the first day were John T. New Canaan, Conn.; Ewen Macken-Burns, zie and N. Butterbach, New Rochelle, N. Y. Second day, W. H. Waite, Rumson, N. J.: Second day, W. H. Waite, Rumson, N. J.; James MacMahon, Tuxedo Park, N. Y.; Her-bert H. Fletcher, Millbrook, N. Y. Third day, Joseph Bradley, Dobbs Ferry, N. Y.; Joseph Mooney, Hastings, N. Y., and John Featherstone, North Tarrytown, N. Y. E. W. N.

#### THE TUXEDO (N. Y.) SHOW.

The Tuxedo Horticultural Society's An nual Fall Show was held in the Tuxedo Club House on November 5th, 6th and 7th, 1915, and proved to be the finest ever held in Tuxedo. Great credit is due to the Man ager, Mr. Fred Bentley, for the splendid manner in which he planned the floor. The exhibits were up to the usual high standard and the entries were larger than in former years. The groups were again the main feature of the show: Mums, Roses and Car nations were very good. The trade exhib its were as follows:

Collection of Single and Pompom Mums and Roses, including the new Rose Red Redience, which were very fine and much admired, from Messrs. A. N. Pierson, Inc. Cromwell.

Collection of Single and Hardy Mums. including some very good things from Scott Bros., Elmsford.

An exhibit of the fern "John Wana maker" from C. A. Peterson, Tarrytown. Collection of Japanese and Pompom Mums from Elmer G. Smith.

There was a very interesting and attrac tive exhibit of Seedling Annemone Mums from Mr. Carl D. Schaeffer, superintendent of the Richard Mortimer Estate. Mr. Schaeffer has worked hard in trying to im prove the Annemone type, and by the qual ity of his exhibit, his efforts have not been in vain. The judges awarded them a Certificate of Merit.

Mr. H. M Tilford (Joseph Tansey, gardener) won the 18 distinct Mums with the following varieties:

R. C. Pulling, Mrs. Wm. Tricker, Mrs. J. P. Mitchell, Rose Pockitt, Mrs. G. Drabble, Pocketts Crimson, Kawanee, Ernest Wild, Mrs. Bogg, Wm. Kleinheinz, Mrs. W. H. Walker, F. S. Vallis, Kate Ainsley, A. Gris

wold, Earl Kitchener, Elberon, Mrs. Surrey, Nakota.

Mrs. J. Murray Mitchell (Thos. Wilson, gardener) won the twelve distinct varieties with the following: Lady Hopetown, R. C. Pulling, Rose Pockett, Calumet, Elberon, Mrs. J. P. Mitchell, Jas. Fraser, Odessa, F. S. Vallis, H. E. Converse, Alganoc. Xarossin

Mr. David Wagstaff (Thos. Lyons, gardener) won the six distinct varieties with: James Fraser, Wm. Turner, Elberon, Men

don, Mrs. Bogg, Mrs. G. Drabble. Mr. Wagstaff's "Mrs. G. Drabble" winning the prize for the largest bloom in the Show.

The judges were Mr. A. Herrington, Mad Thos. Page, Great Barrington ison; Mr. Mass; and Mr. Alex. Mac Kenzie, Highland A, whose judgment was well to

## GLEN COVE (N. Y.) SHOW.

The eleventh annual chrysanthemum exhibition of the Nassau County Horticultural Society was held at Glen Cove, October 28 and 29. Owing to the lateness of the season the different classes were not quite so well filled as in former years, but what was lacking in quantity was made up for in quality. The judges were Messrs. Alex McKenzie, James Stewart and James

Following is a list of the different classes and the successful exhibitors:

Following is a list of the different classes and the successful exhibitors:

Group of chrysanthemums, 60 square teet 1st. Percy Chubb (gardener, R. Jones). Best standard double (plant) 1st. Mrs. J. H. Ottley (gardener, J. McDonald); 2nd. Mrs. G. D. Pratt (gardener, J. F. Johnston). Best standard single 1st. Mrs. G. D. Pratt; 2nd. E. W. Kimball (gardener, J. McDonald); 2nd. Mrs. G. D. Pratt; 2nd. E. W. Kimball (gardener, J. McCarthy). Best bush double 1st. J. R. De Lamar (gardener, R. Marshall; 2nd. Percy Chubb. Best bush single 1st. E. W. Kimball; 2nd. Percy Chubb. Six chrysanthemums in 6 inch pots -1st. Percy Chubb; 2nd. W. R. Coe (gardener, J. Robinson). #### MOUNT KISCO'S N. Y. FALL SHOW.

The thirteenth annual show of the North Westchester County Horticultural and Agricultural Society was held in Mt. Kisco, N. Y., October 29 to 31 and was in all respects equal to any show of former years both in quality and quantity. Competition was very keen in chrysanthemums, roses and carnations. The society's special cup brought out some magnificent blooms of chrysanthemums, there being three very close competitions in this class.

The judges were Adam Paterson, A. T. Brill, and William Jannison.

Summary of chief events tollow:

Best 12 dry anthoniums, 6 varieties E Mayer, Jr., 1st (Chas Rinthen, gardener), E Bayer, 2nd (A. Rose, gardener); Mrs. No stadt, 3rd (David Gordon, gardener), society

stadt, 3rd (David Gordon, gardener), society silver cup.

Best collection, cut singles Mrs. Mayer, 1st; M. J. O'Brien, 2nd; Mrs. Taylor, 3rd (Alex. Thomson, gardener).

Best collection, 12 blooms chrysanthemums. 6 varieties (society's silver cup) -E. Bayer, 1st; E. Meyer, 2nd; Mrs. Neustadt, 3rd.

Best 12 pink roses E. Bayer, 1st; Mrs. Neu-tack 2nd; Mrs. Neustadt.

stadt, 2nd. Best 12 red roses E. Bayer, 1st; Mrs. Tay

2nd. Best 12 white roses E. Bayer, 1st; Mrs.

Best 12 white roses E. Bayer, 1st; Mrs. Roustadt, 2nd.
Best 12 red carnations E. Bayer, 1st; Mrs. Taylor, 2nd.
Best 12 white carnations E. Bayer, 1st; Mrs. Taylor, 2nd.
Best 12 light pink carnations E. Bayer, 1st;

Best 12 light pink carnations E. Bayer, 1st; Spanus, 2nd.
Best 3 begonias (E. Bayer, 1st; John Mayer, 2nd (Jas. Aitchison, gardener).
Collection orchids (H. A. Spanus 1st) 12 distinct varieties apples—A. W. Butler, 1st (John Hall, superintendent); Mrs. Taylor, 2nd; Chas. Brown, 3rd.
15 distinct varieties vegetables (Mrs. Taylor, 1st; E. Meyer, 2nd; Wm. Sloane, 3rd (Ed. Cullam, gardener).
12 distinct varieties vegetables (Wm. Sloane, 2nd (Ed. Cullam, gardener).

thiam, gardener).

12 distinct varieties vegetables. Wm. Sloane.
1st; Mrs. Taylor, 2nd; E. Meyer, 3rd.

#### NEW LONDON (CONN.) SHOW.

The Chrysanthemum and Fruit Show of the New London Horti ultural Society was held in the basement of City Court House. November 3 and 4. The exhibition was voted the best and most successful in the history of the Society. Among the non-contestant exhibits was a huge bank of potted Single Chrysanthemums, arranged by the Harkness Estate. In the centre of the hall two groups stood out arranged and exhibited from Branford Farms, Ernest Robinson gardener and the Guthrie Estate, John Maloney gardener.

In the class for twelve Chrysanthemum blooms of any variety staged singly Stanley prize in the chrysanthemum cut bloom

Twelve 2nd, W. 1 Twelve 2nd, W. 1 Twelve 2nd, W. 1 Twelve 2nd, W. 1 Twelve 2nd, W. 1 Twelve 2nd, J. 2n Farms second.
In the classes for vases of four blooms,

In the classes for vases of four brooms, strain-cighteen to twenty-four inches, of Crimson, Yellow, Pink, Bronze and White, Branford Farms won first in the Pink and White, Hark-ness Estate first in Crimson, and the Palmer Estate first in Yellow and Bronze. In the class for Carnations Harkness Estate won first

In the on first.

The vegetable class brought out only two exhibitions, Stanley Jorden winning one, Alfred Flower the other.

Among Bush Plants and Specimens the hon-

Among Bush Plants and Specimens the honors where divided between Alfred Flowers and Gustav Newmann of the Mitchell Estate. Edward A. Smith arranged a very attractive exhibit of Solanums, Begonias, Palms and Ferns, Pot Chrysanthemums, etc., all clean, well grown stuff.

In the classes for fruits Mr. Palmer received first for five plates.

Collection ten varieties—Mrs. Wiggins, first; Dr. Rogers, second. Single dishes were shown by a number of competitors, the whole display was very effective and gave great credit to the local growers.

Amateur classes brought out two competitors only, Mrs. G. W. Nichols and W. P. Steward showing six plants of chrysanthemums. The judges for the show were Thomas Snyder, of the Plant Estate, Groton, James Chandler, of the Schull Place, New London.

Chandler, of the Schull Place, New London, W. Guldydy of Norwich

STAXLEY JORDEN.

Secretary.

#### STAMFORD (CONN.) SHOW.

The fifth annual Fall exhibition of the Westchester and Fairfield Horticultural Society was held in the Armory at Stamford, Conn., November 5-6. The 118 classes provided for by the schedule were all well filled, the competition was very keen, the quality throughout the entire exhibition was of a very high standard, and the cultural skill displayed reflected great credit on the exhibitors. Noteworthy features were the trained "Mum" plants exhibited by W. J. Sealey. The "Eats" came next. with a large and varied assortment of vegetables of extra fine quality. The fruit section attracted a lot of attention, the apples being particularly fine. The display of outdoor flowers by J. P. Sorenson, of Essex Fels, N. J., was very large, and really consisted of a botanical collection. flower loving public of today attend the exsee the decorative use of hibitions to flowers, as well as to merely see extra large specimens of blooms. Eight fine dinner table decorations were in evidence. First prize was awarded to Thos. Aitcheson, gard. for Mrs. Nathan Strauss; second, to Mrs. Ewen McKenzie; third, to Alex. Geddes, gard, for Mrs. Albert Crane. A great number of floral center-pieces and baskets were exhibited. The honors were divided by Thos. Aitcheson, Ewen McKenzie and P. W. Popp. The flowering and foliage plant group arranged by Adolph Alius, gard. for J. B. Cobb, won first prize, and was also awarded the prize for the most meritorious exhibit of the show. Cold storage lilacs and spirea were featured in this group. The first prize for group of chrysanthemum plants was won by G. D. Sullivan, gard, for Mrs. Wm. Nichols. P. W. Popp won first prize for group of cut chrysanthemums, all types covering 100 square feet arranged for effect. Robt, Grunnert was a close second. The largest bloom in the show was a fine specimen of the var. Wm. Turner, exhibited by Ewen McKenzie, who carried off first

classes. The most prominent winners were: A. Bieschke, gard, for Wm. Ziegler; Ewen McKenzie, gard, for Miss Georgianne Iselin; Thos. Aitcheson and Wm, Whitton, gards. for Mrs. J. H. Flagler; P. W. Popp, gard. for Mrs. H. Darlington; A. Alius and Jas. Stuart, gards, for Mrs. F. A. Constable; Jas. Linane, gard, for G. D. Barron; Joseph Tiernan, gard, for Adrian Iselin, Jr.; Carl Hankenson, gard, for A. G. Smith; Duncan McIntyre, gard, for Mrs. Ernest Iselin; in the pompon 'mum classes honors were divided by W. J. Scaly, Joseph Tiernan and Thos. Bell, gard, for Fred'k Sturgess; in the single 'mum classes Mrs. F. A. Constable, Miss G. Iselin, A. G. Smith and John I. Downey, Thos. Ryan, gard., were the principal winners; in the carnation classes the honors were divided by W. W. Heroy, A Wynne, gard.; Robt, Grunnert, E. C. Converse, Wm. Graham, gard.: Mrs. Nathan Strauss, E. C. Benedict, Robt. Allen, gard.; Mrs. Albert Crane, J. B. Cobb, Hemy Sturgess, H. Kolberg, gard.; in the rose classes the most prominent winners were Anton Peterson, W. H. McGinnis, gard, for Mrs. L. P. Childs: Henry Sturgess, J. Clunas Alex Geddes, Mrs. Oliver Hoyt, gard, Jas. Foster: in the orchid section honors were divided by E. C. Benedict, Mrs. F. A. Constable Mrs. Oliver Hoyt and J. B. Cobb The most important winners in the miscellaneous foliage plant section, also flowering plants other than those already speciwere: Mrs. H. O. Havemeyer, J. B. Cobb, E. C. Benedict, Miss G. Iselin, Wm. Ziegler, Jr., W. M. Heroy and Robt. Grunnert; in the fruit section, Mrs. L. C. Childs. Mrs. H. O. Havemeyer, E. C. Benedict, Mrs. Albert Crane, W. H. Heyes, Geo. Lowther. Emil Johnson, gard., shared the honors. The vegetable classes were all keenly contested and the most prominent winners were: Mrs L. C. Bruce, John Andrew, gard.; G. D. Barron, Mrs. F. A. Constable, Mrs. Albert Crane, Mrs. Oliver Hoyt, C. F. Wills, Martin Glendon, gard.; Mrs. A. A. Anderson, Robt. Williamson, gard.; Fred'k Sturgess Anton Peterson and Robt. Grunnert.

The judges were Sam'l Redstone, Philadelphia, Pa.; Howard Nichols, Yonkers, N. Y.; Sam'l Trepass, Glen Cove, L. I.; Wm,

Turner, Oceanic, N. J. P. W. POPP, Cor. Sec'y.

#### NEW BEDFORD (MASS.) SHOW.

The annual chrysanthemum exhibition of the New Bedford Horticultural Society held November 9 and 10 was a most noteworthy event, for never before has this city seen such marvels of beauty and even the amateur was much in evidence owing to the open fall.

Competition was very close between D. F. Roy, sperintendent of the Converse place, and A. E. Griff'n, superintendent of the Galen Stone estate. All classes were closely contested, Roy winning three cups and Griffin carrying away two trophies. The class for 18 blooms was so close that decision seemed almost impossible until one flower in the Stone exhibit that was a little too far advanced was discovered; Mr. Roy won.

Henry S. Walsh, of Kingston, exhibited some fine specimen blooms, some as fine as any in the hall, and won five firsts out of

seven entries.

The class calling for a group of chry santhemums arranged for effect always allows for a display of taste, and the person arranging the Converse exhibit certainly showed an artistic temperament. Mums of all kinds, colors, shapes and sizes inter mingled with palms, ferns, dracenas and the like, standing six feet high in the rear and sloping to the floor, created a gorgeous sight and well deserved the recognition given.

Among the amateurs Jose S. Figuerido and Jos. C. Forbes were the chief contestants, premier honors going to the former. Mr. Figuerido also won the cup offered by Mr. Roy (doner not to compete) for the most blue ribbons won during the season. W. D. Hathaway, the dahlia man, was a close second, falling only one point behind, W. F. TURNER.

#### SOUTHAMPTON HORTICULTURAL SOCIETY.

The Southampton Horticultural Society held its fortnightly meeting on November 4, when there was a social reunion and oyster supper and a very strong meeting. Mr. Walter Jagger was the chief speaker for the evening, assisted by Mr. Julius King, Mr. J. Johnson, M. S. Cowen. The meeting closed at 10:30 p. m., all the members agreeing they had spent a most enjoyable evening. The weather being stormy kept many from attending, otherwise the Oddfellows Hall would have been crowded. R. S. CANDLER, Cor. Sec'y.

#### OYSTER BAY HORTICULTURAL SOCIETY.

The regular monthly meeting of the Oys lets, 12 roses, one variety, three heads letter Bay Horticultural Society was held on tuce.

Wednesday, October 27, at Fireman's Hall, Oyster Bay, President presided,

Mr. John Sorosick reported for the committee that the Dahlia Show was quite a

Messrs, Luigi D. Amiello, Gerald Martin and Alex Michie were elected to active membership and Mr. Allan Kirkwood to associate membership.

The meeting room was a flower show in itself and the president appointed the following to act as judges: Messrs, Bell, Robertson and Gibson, who reported as follows: Three chrysanthemums, one variety, society's prize, Joseph Robinson; three celery, soriety's prize, Lewis Denello; three cauliflower, society's prize, Frank Petroccia; collection dahlias, Joseph Robinson, Cultural certificate; vase roses, "Ophelia," William Ford, honorable mention; six vases single mums, James Duthie, certificate of merit; one vase single mums. Frank Kyle, honorable mention; one vase single mums, J. Sorosick, thanks of society; one vase cosmos, J. Sorosick, thanks of society; one vase single dahlias, J. Soresick, thanks of sc. ciety; one vase phlox, J. Soresick, honor able mention: three figs, A. Tannski, thanks of society.

Exhibits for next meeting will be 50 vio-A. R. KENNEDY, Secretary.

#### CHICAGO'S FLOWER SHOW

Chicago's "Grand Flower Festival" which opened in the Coliseum, in that city, on November 9th, proved a most attractive show.

The interest taken in this year's Chicago Fall Show by the private gardeners was greater than at any previous shows of its kind and there was some keen competition between them. The collection of vegetables staged by the Lake Forest and Lake Geneva gardeners in competition was one of the features of the show.

The awards to private gardeners were:

The awards to private gardeners were:

Six white mums, cut-4. J. Mitchell, A. J.
Smith, gardener, first; Mrs. S. W. Allerton,
Robert Blackwood, gardener, second.
Six yellow mums J. J. Mitchell, first; Mrs.
S. W. Allerton, second.

Swift, first; North Shore Horticultural Society,

Best club collection of vegetables—Lake Geneva Gardeners' and Foremen's Association, first; North Shore Horticultural Society,

Most meritorious exhibit-G. W. Blossom,

first.

Meritorious exhibit, not otherwise provided J. S. Tilt, first.

#### CLEVELAND FLOWER SHOW

The Cleveland Exhibition was chiefly noted for the marvelous quality of the Chrysanthemum flowers there exhibited. Every grower of repute who had good stock this year seemed to have planned to attend the Cleveland Show, and show the world what he could do.

The best individual variety, was as usual, Wm. Turner, although a great many others were shown in splendid condition.

The competition was very fine and many classes had from six to ten entries. Pos-

Washington, New York; with the Dale Estate of Brampton, Canada, second, and Wm. Duckham, Madison, N. J., third. Other first the prize winners among the more than class exhibits were those of Elmer D. Smith, Adrian, Michigan, and E. G. Hill Co., of Richmond, Indiana. Mr. Vert's finest flowers included Mrs. Drabble, Mrs. Paul Moore, Earl Kitchener, Mrs. J. P. Mitchell, Wm. Turner and F. S. Vallis. Other varieties shown in splendid condition were Odessa in yellow, Pocketts Crimson and Gertrude Peers in crimson, Harry Converse and C. H. Totty in bronze, and of course the unbeatable Turner in white.

For the "100 blooms any variety," E. G. Hill Co. received first for 100 Wm. Turner's which were very fine. The bronze Harry Converse, exhibited by the Dale Estate, were the most beautiful flowers in the show and caused considerable comment.

The commercial types such as Dr. Enguehard, Chieftain and Major Bonnaffon, while wonderful in their way, were not so much noticed as the "big fellows." Chieftain, as shown in Cleveland, was fine.

The largest individual flower in the show was won by Chas. H. Totty, Madison, N. J., with Wm. Rigby, the yellow sport of Mrs. Drabble.

Pompons and Singles were shown in larger array than ever before probably in any exhibition. They were a large feature in all the fall shows and the interest in these types is increasing since they can be grown in any situation and will produce good results.

The Rose exhibits, for a fall show, were of marvelous quality. A. N. Pierson, Inc., Chas. II. Totty, S. J. Reuter & Son, E. G. Hill Co., and other well-known growers all competing.

A great deal of interest was taken in the balloting for a name for a new Rose that was shown at the Cleveland show. By publie decision the Rose was called after the city—"Cleveland." This and another novelty Rose, Gorgeous, was shown by Chas. H. Totty: Tipperary, by the E. G. Hill Co.: Mrs. Bayard Thayer, by the Waban Conservatories, and Red Radiance, by A. Pierson. Inc. Also an unnamed yellow Seedling was shown by S. J. Reuter & Son.

Some criticism was aroused on the opening day by the fact that there were not sufficient judges appointed to judge the stock and some stock was carried over to the second day before being judged. This was an injustice to the eastern exhibitors, whose stock had been in most cases in the boxes two or more days before being staged and delayed another day before being judged. Doubtless another year the committee will see that this mistake is rectified and have an ample number of judges at the show on the opening day.

The plant sent out by Oscar Lewisohn, John Canning, Supt., was the feature of the show, since it was the largest plant ever seen outside of the city of New York. The retailers' displays on the different days were also very good.

The publicity men had worked overtime in their section and the results were abundantly apparent. On the second day the school children being admitted to the show, were so many that traffic was blocked on Euclid avenue, the main thoroughfare of Cleveland, and a squad of eighty-five policemen was necessary to keep the line in order. This is a record for a flower show and the management, one and all, have cause to congratulate themselves on the success of their show.

#### PROVIDENCE, R. I., FLOWER SHOW

was won by Wm. Vert of Castlegould, Port | Narragansett Hotel, Providence, R. I., on Thursday and Friday, November 11-12.

The judges had no easy task in judging forty exhibitors and more than three hundred exhibits. In addition to the regular prizes offered, many specials were awarded. While the varieties of flowers and fruits were many, Chrysanthemums predominated. The Rhode Island Hospital took first prize for the largest exhibition of Chrysanthemums and first prize for the largest bush plant which had more than three hundred blooms. The fine exhibit of apples and pears attracted the visitors' interest.

The exhibition was in charge of Eugene A. Appleton, Joshua Vose, Arthur Sellew, Cornelius Hartstra, Dr. H. W. Heaton. President Dr. H. H. York and Secretary Ernest K. Thomas were ex-officio members of the committee

#### THE WESTCHESTER AND FAIRFIELD HORTICULTURAL SOCIETY.

An unusually fine collection of seasonable flowers were in evidence at the regular monthly meeting, November 12, a feature of which was a splendid showing of Carnations in competition for the prizes offered by Mr. Andrew Kennedy, seedsman of New York City. There were twelve vases of twenty-five each and a finer lot of Carnations would be hard to find anywhere. The winner of first prize was Wm. Graham, second, Robt, Allen. The other exhibitors were accorded the hearty thanks of the society.

Three new members were elected and four new names were proposed for membership. The Fall Show Committee made a report, showing the recent exhibition to have been a great success financially as well as a firstclass exhibition. A rising vote of thanks was extended to all those who helped in various ways to make the exhibition such a grand success. It was voted to change the meeting place from the present hall to the Isaac Hubbard Hall, also in Greenwich, to take effect January, 1916. The Executive Committee presented a list of names to fill the offices of the society for the year 1916, which will be balloted for at the next meeting. A communication from the Nassau County Horticultural Society read at a previous meeting was again brought up for discussion. The communication asked for the co-operation of the Westchester Fairfield Horticultural Society in establishing a movement throughout the country whereby, with the aid and co-operation of the National Association of Gardeners of America, a member of a local horticultural society in good standing, that is, with his annual dues paid up for the current year, who should have occasion to remove to another locality and being desirous of affiliating himself with the local society in the new locality, would automatically become a member of such society upon presentation of an identification card or letter from the secretary of his own society, without any additional cost to him for that year, thereby enabling such member to enjoy the friendship and goodfellowship of his kind. and the usefulness of an enthusiast would not be lost to the profession of horticulture even for a short time. The proposition received the unanimous endorsement of all the members present. The local co-operative will endeavor to assist in every way possible. The members of the Nassau Horticultural Society, as represented by their local co-operative committee, deserve great credit for advancing the most tangible and clearly defined step ever taken in real and practical co-operation, and with the assistance of the N. A. G. Co-operative Commitsibly the best blooms of all were staged in the class calling for "24 varieties," which Island Horticultural Society was held in the profession of horticulture on a plane never

The

before attained in America to my knowledge. The judges made the following awards in the non-competitive exhibits: Ewen Mc-Kenzie for two unusually fine vases of "Mums," Wm. Turner and Odessa, Cultural Certificate; vase of Pompon Mums in forty varieties, from W. J. Sealy, highly com-mended. A Wynne was highly commended for vase of seedling Carnations. The thanks of the society was accorded to Robt. Grunnert for "Mums," P. M. Popp for Lily-of-the-Valley, Wm. Whitton for Coll. Antorhi Mums that were particularly fine, Louis Wittman for Cosmos, Carl Hankenson for Roses, J. B. Andrew for Celeraic Giant Prague was highly commended.

Next meeting December 10. Don't forgethe election of offices for 1916.
P. W. POPP, Sec'y. Don't forget

#### NASSAU COUNTY HORTICULTURAL SOCIETY.

The regular monthly meeting of the above society was held in Pembroke Hall, Glen Cove, Wednesday, November 10, President

Westlake presiding.

Messrs. J. Robinson, J. Adler and W. D. Robertson were appointed judges for the evening, and their awards were as follows: Best three blooms Chrysanthemums, white, first, J. F. Johnston; best three blooms yellow, first, J. F. Johnston; best three blooms pink, first, H. Goodband.

The special prize donated by H. Gaut for the best table decoration (assistant gardeners only) brought out some strong competition, there being seven tables in all. First. M. F. Herganham; second, II. Michaelson; third, J. McDougal.

The annual meeting of this society will be held on Wednesday, December 8, when election of officers for the year 1916 will take place. It is hoped that every member will try if possible to attend this meeting. JAMES GLADSTONE, Cor. Sec'y.

#### NEW JERSEY FLORICULTURAL SOCIETY.

The regular monthly meeting of the above society was held in the Jr. O. U. A. M. Hall, Orange, N. J., on Monday, November 1, 1915, at 8 p. m. A talk on tree surgery and entomology was given by F. A. Cutler of Orange. It was very interesting and enjoyed immensely by the members. Schneider, gardener to Peter Hauck, Jr., received points for the following in monthly competition: Begonia metalica, 80; vase of violets, 60; vase of carnations, 70; vase of 'Mums, 70; Emil Panuska, gardener to Mrs. Wm. Barr, received 80 points for a fine specimen plant of Celosia Pride of Castle Gould. The meeting closed at 10:30 with a vote of thanks to Mr. Cutler for his talk The judges were Wm. Reid, Chas. Ashmead. Deitrich Kuedsgrab.

GEO, W. STRANGE, Sec'y.

#### NEW JERSEY FLORICULTURAL SOCIETY.

The tenth annual Dahlia, Gladiolus, Fruit and Vegetable Show was held in the Jr O. U. A. M. Hall, Main and Park streets. Orange, N. J., on Monday, October 4. show was the greatest success of any ever held by the society.

That the blooms were large and at least the equal of those at the New York show, was the opinion of many present. W. A. Manda staged a wonderful collection and carried off many of the prizes. P. W. Popp. gardener to Mrs. H. Darlington of Mamaroneck, N. Y., took seven first prizes in all the large classes. A fine collection of fruit was staged by Sidney and A. M. Colgate,

Wm. Reed, gardener, which took first prize. William Shillaber, J. P. Sorenson, gardener, of Essex Fells, N. J., was second with an equally fine display. The miniature gardens were a feature and created considerable interest for visitors. Mrs. A. J. Moulton of Llewellyn Park, Orange, A. A. Thomas, superintendent, took first prize, and the Essex County Country Club, Gustaf Christensen, gardener, was second, although the competition was exceptionally close. pumpkin weighing 70 pounds staged by Donald McGowan and raised in his own yard attracted considerable attention. A special prize, silver medal, was awarded to Sidney and A. M. Colgate for a fine group of palms and foliage plants. A fine display of annuals exhibited by Wm. Shillaber, Essex Fells, was awarded a first-class certificate. They were of excellent quality and variety.

Awards were made in 49 classes, prizes being won by Mrs. H. Darlington, Mamaroneck, P. W. Popp, gardener; W. A. Manda. South Orange; William Barr, Llewellyn Park, E. Panuska, gardener; Peter Hauck. Jr., East Orange, Max Schneider, gardener; Mrs. Rus-ell Colgate, J. Larachan, gardener; Mrs. C. H. Stout, Short Hills; Wm. Shilla-ber. Essex Fells; Walter Gray, Maplewood. and others. The judges were Peter Duff. Orange: W. A. Manda, South Orange, and Alex. Robertson, Montclair.

GEO. W. STRANGE, Secretary.

# The three vital features of your Christmas Grafonola

For, of course, your new instrument will be a Columbia, if it is a question of musical quality—of certainty of lasting enjoyment. Judge the superiority of the Columbia Grafonola, first of all, upon its superb tone.

## Tone:-

Tone perfection depends fully as much upon the scientific exactness of the reproducing mechanism of the instrument itself as upon the original recording process. The perfected reproducer and tone-arm of the Columbia Grafonola is the crowning achievement in this branch of the art.

Once you realize the tone possibilities of the Columbia Grafonola, playing Columbia Records or any other records, we believe you will never again be satisfied with any tone lessfull and true, less brilliant and round and natural.

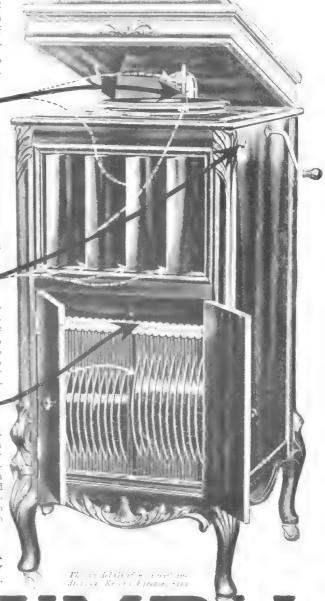

## Tone control:

With the Columbia you have every possible gradation of tone at your command. The tone-control leaves, built on the one right principle of controlling tone-volume, and the wide variety of needles available, give you any and all degrees of tone-volume, from the lightest pianissimo to the resounding fortissimo to fill the largest auditorium.

## Convenience:

Your Grafonola, equipped with the individual record ejectors, an exclusive Columbia feature, is ideal in its convenience. Your records are racked individually in velvetlined slots that automatically clean them and protect them against breaking and scratching. A numbered push-button controls each record—a push of the button brings any record forward to be taken between the thumb and fingers.

## BURPEE'S SEEDS GROW

POR forty years we have rendered faithful service. For forty years we have tried to make each year's service more nearly ideal. This untiring effort has built for us not only the World's Largest Mail Order Seed Business, but also a world-wide reputation for efficient service and undisputed leadership.

Much more opportune than anything we ourselves may say about Burpee Quality Seeds, are the many remarkable things our thousands of

customers and friends have said and continue to say about them. These customers return to us year after year, not because seeds cannot be found elsewhere, but because of our superior quality and service.

Any one who is not thoroughly satisfied with the products raised can have his money back any time within the year, for such is the guarantee that protects all who plant seed bought from Burpee of Philadelphia.

## Fortieth Anniversary Edition of Burpee's Annual

"The Leading American Seed Catalog" for 1916 is unlike any other catalog. The front cover illustrates in nine colors the greatest novelty in Sweet Peas, the unique "Fiery Cross." The back cover shows the two famous Burpee Bantams, Golden Bantam Corn and Blue Bantam Peas.

The colored plates, six other Burpee Specialties in Vegetables, and the Finest New Burpee Spencer Sweet Peas; also the New Gladioli, Fordhook Hybrid. This Silent Salesman is mailed free. A post card will bring it. Write today.

## DREER'S GARDEN BOOK FOR 1916

is more than a catalogue. It is a guide-book of authoritative information on when to plant, how to plant and what to plant in whatever line of gardening you are interested. It contains cultural articles written by experts and is valuable alike to the amateur with a small plot or the professional with acres. It contains 288 pages, four color and four duotone plates. It lists all the dependable, tested, standard varieties of flowers and vegetables as well as the season's best novelties.

The newest Roses, the best Dahlias, and Dreer's Improved Hardy Perennials are given special prominence.

It features a number of noteworthy specialties in Vegetables, Sweet Peas, Asters and Phlox. Whatever is worth growing you will find in Dreer's Garden Book for 1916, with full instructions how to grow it.

Ready in January, and will be mailed free if you mention this publication.

"Excellenta" Quality Bulbs

## TWO NEW "MUMS"

FOR THE BACK ROW

Artista.—This we believe is the largest Exhibition variety we have ever raised and doubt if it will be surpassed by any now grown, not excepting Wm. Turner, Odessa, etc. Outer petals grooved or channeled, reflex, while the center ones incurve irregularly, giving a very artistic appearance to the bloom. Dwarf habit, will not attain over 5 ft. from February propagation. White with a slightly creamy tint in the depths. Best bud August 20th, maturing the last days of October. All exhibition growers are bound to accept this as one of the best.

Ogontz.—A seedling from Nakota which it greatly resembles in foliage, and has the same whirling arrangement of petals, with size equal to its parent. The petals are decidedly grooved or channeled. Color, light primrose, height 6 ft. Would not advise a bud earlier than August 30th as the blooms are double from those selected in September. Practically the same as Nakota except color, maturing first week of November. May also be advantageously grown as a commercial maturing November 20th from buds taken September 20th and after.

Price.—\$1.50 each; \$12.50 per ten; \$100.00 per hundred. Delivery on or before February 1st, 1916. Not less than 5 plants of a variety at ten and 25 at hundred rate.

## LILIUMS---SPIREA---LILY OF THE VALLEY

The following bulbs and roots have arrived:

#### HARDY LILIUMS

The three best Hardy Lilies for outdoor or indoor growing have arrived. Have you placed your order for your full requirements? They may be planted now in pots and carried over until planting out time next spring.

AURATUM (Golden Banded Lily)		SPECOSUM ALBUM	SPECOSUM MAGNIFICUM			
	100	Doz. 100	Doz. 100

## Gardens of the Lenox Region of Massachusetts

In the early days of October it was my happy privilege to be able to take a round trip by way of the Hudson River, then in the first flush of its autumn splendor, the heavily timbered slopes on either side for most of the journey being tinted with gold, amber and crimson. A veteran of the G. A. R. who was returning from the great review at Washington, was heard to remark, "This is the finest part of our whole trip." The warrior who spoke had an ensign pinned to the lapel of his coat bearing the word "Illinois," so it can be safely assumed that he had traveled quite some distance. So much for the American Rhine. It is a noble river worthy of all the praise that has been bestowed upon it.

EVERGREEN PLANTING ALONG THE DRIVEWAY, AT "ALLEN WINDEN," LENOX, ON THE APPROACH TO THE RESIDENCE OF CHARLES LANIER.

From Albany the journey was made to Pittsfield, Mass., and by trolley to the little town or big sized village of Lenox, in the midst of the Berkshire Hills. This district is one of much splendor, consisting of pretty hills with deep cut valleys and here and there a lake, most of the hills being heavily wooded with trees that in some cases represent the primeval type of forest; these were oak, birch, maples, tulip trees and some evergreens.

The whole countryside is dotted with beautifully kept estates and houses of the wealthy, and everywhere there are splendid highways and miles of smooth tarvia, which criss-cross the country from end to end, Massachusetts especially. The Hudson River lies directly west some 30 or 40 miles away. It is here that one finds some of the

best gardens and gardening of the United States, and it is said that within a radius of three miles or so around Lenox there are 27 private estates of varying size.

Another notable point is that the gardeners and superintendents here evidently enjoy the confidence of their employers to the fullest extent, and indeed in many cases, while the places have changed hands the gardeners have remained at their posts, in some instances under two or three different owners or agents.

At Allen Winden, the estate of Charles Lanier, in charge of A. H. Wingett, one finds a compact range of glass, Pierson U-Bar houses, all modern, where Roses, Carnations, and quite a considerable display of orchids are all well grown. Lady Hillingdon among the Roses, from June planted stock, was doing especially well in solid benches. Hadley and Ophelia, too, were favorites, as well as Ward; it would be difficult to find better Roses than these anywhere.

Of the orchids, mention might be made of Ada aurantiaca, Oncidium ornithogalum, which one finds is a great favorite in nearly all gardens of this neighborhood. When nice specimens in 5-inch or 6-inch pans are well

GLIMPSI OF PLAZZA OF CHARLES I ANIER'S RESIDENCE, SHOW-ING VISTA OVER THE EVERGREENS, OF MOUNTAINS SEVERAL MILES AWAY.

flowered they are indeed one of the most delightful of all decorative indoor plants; thirdly, Odontoglossum grande, a plant not so trequently seen as it ought to be.

There were also nice batches of Dendrobium, Phalænopsis, Vanda cærulea. Cattleya Bowringiana, and of course the essential Oncidium varicosum, Cattleya labiata and C. Mossiæ.

A bench filled with Adiantum Farleyense was very refreshing and attractive, and here my friends got a laugh upon me when I asked if these were from spores, forgetting, if ever I knew, that this plant is propagated by division of the crown. A good story is told in this connection of one gardener who generously gave an order for an ounce of Farleyense seed to a traveler for one of the seed houses. He is still waiting for that ounce of seed.

Of the Carnations, allusion should be made to the variety Lady Algy, a very free flowering scarlet-salmon, named in honor of Lady Lenox; also Benora and Mrs. Ward. White Wonder likewise appeared to be another of Mr. Wingett's chief standbys in the other benches.

A neighboring house contained a very brilliant collection of single and double flowered tuberous Begonias of the best strains from Blackmore and Langdon, English raisers, but the plants, of course, were now well past the heyday of their glory. Nevertheless, it was a real treat to see these resplendent plants so well cultivated and to find the climate of this region suiting them so well. In many parts of the United States tuberous Begonias cannot be got to flourish. One would like to see the hybrid Winter-flowering Begonias taken up and made a success of, too, by some of our friends in Lenox. They are, indeed, very well grown by a few of the Boston men, and once in a while they are exhibited at New York shows. This is a race of strong growing Begonias raised by crossing the single pink-flowered species Socotranos with double tuberous kinds. The man who first cross-

bred or hybridized and obtained varieties in this section was John Heal, one of the sectional foremen at Veitch's great nursery in London. He started work some 20 years ago, and introduced as his first Winter Cheer and Mrs. Heal; each of them carmine singles, with large flowers in liberal trusses. He was a most efficient plantsman and succeeded with these almost better than any other person. Even today in England, after Winterflowering Begonias have been exhibited for many years in the finest style, it is the exception rather than rule to find plants anything like as well grown as Heal grew them. One ventures to think, however, that if an exhibit of thoroughly well grown plants of these hybrids in some of the newer double flowered pink and orange shades were exhibited at November or December exhibitions they would cause something of a sensation.

To return to Mr. Wingett's houses, memory brings to view some remarkably fine zonal Geraniums in 8-inch pots, spreading out to a couple of feet in diameter, crowded with trusses of bloom. These were three-year-old plants, as Mr. Wingett believes that old stools flower best. This is not the view held by some other growers, who also produce big specimen Geraniums grown from cuttings taken the same year.

In speaking of ferns one should have mentioned Polypodium Mandaianum, which together with palms and other foliage plants filled one of the houses.

Indoor Peaches, Grapes, Figs and Melons were all in first-class condition; the Figs being branching young stock 2 feet high, from cuttings taken early last Spring. Melons are cut from the first of July onward.

Out-of-doors one found show borders of hardy Phloxes, Anemone Japonica (which comes through the Winter here if it is covered with manure), and other hardy plants in their season, affording something to steady the eye upon, or to cut for the house.

APPROACH TO GREENHOUSES AND FARM AT "ALLEN WINDEN" THE LENOX ESTATE OF CHARLES LANIER

Casting back one's mind, one of the strong features at Elmcourt, the home of Mrs. J. Sloan, where A. Heereman is superintendent, was the flower garden laid out on a southern slope below the plant houses, all the beds being mainly rectangular and filled with plants of one kind. Some damage had been done to the effectiveness of the general scheme of color and combination this year owing to the stem rot disease which carried off the Antirrhiniums. No cure seems so far to be known for this trouble, which may very gravely imperil the development of this most desirable and beautiful Summer flower. Others of the beds contained Phloxes, Dahlias, Cannas, Anemone Japonica, Pandanus scabious, Heliotrope, Salvia splendid, Gaillardias, double Marigolds, Achillea Ptarmica fl. pl., Carnations, Rudbeckia, Galtonia, some ·of these also being used in borders.

The Dorothy Perkins Rose is liberally and well em-

THE ROSE GARDEN AT "WYNDHURST," LENOX.

ployed on trelises and arches. Good use was also made of the ordinary Tropeolum or Nasturtium on the wall of the potting sheds, making quite an effect.

Under glass there were nice crops of Radiance and Ophelia Roses, fine Crotons, Princess of Wales being grown to a single stem, 4 feet high, and the perfect picture of health, as well as being finely colored. Mignonette, Stocks, Antirrhinums, and two houses of Cattleyas also called for reference.

A delightful old English garden has been made in the front of the house with flag stones for steps in a line down the terraces, and on each side, set upon pillars, were marble tazzas. A pergola, very substantial-

ly and well made, of beautiful design in the form of a semicircle, terminated the lower end of this terrace garden, and here a delightful fish pond and fountain were placed, the pergola itself being covered with a selection of beautiful hardy creepers and on either side at the limits of the terrace were plantings of choice evergreens.

Another notable feature of Elmcourt is an ancient Elm tree, which has attained the remarkable height of 98 feet, and is rightly regarded as one of the largest in New England.

Very handsome Latanias in tubs, as well as other palms, notably Phoenix humilis, reaching 25 feet high, were striking objects in the forecourt.

The gardens at Wyndhurst, over which A. J. Loveless presides, are of the most notable in the Lenox district. complete in all their parts, and everything outdoors and

under glass is remarkably well done and lacks nothing.

One of the more recently developed features is the hardy plant garden in which Roses play a prominent part. These are in beds by themselves and also used on arches and fences. The whole garden is well sheltered, lying a little to the north of the house. Here one finds large beds filled with one kind of plant, or several contrasting kinds, such as a bed of Delphiniums, a bed of Anemone Japonica, or Iris dalmatica. Sometimes a combination of plants is used, as in the case of one filled with Zinnias, Penstemon Scarlet Gem, and Phloxes; or a yellow bed containing Rudbeckia, Marigolds, and touched up with orange and scarlet Kniphofia Pfitzeri. Iceland Poppies had been used as an edging.

Much use, and good use, is made of the Summer Cypress, Artemisia racemosa, a very graceful plant, not sufficiently appreciated, and fine for sub-tropical bedding

or for other good effects in Summer plant-

mgs.

A border of Foxgloves, while past its glory, and indeed being replanted for the coming year, gave token of the beauty that must have been here in the earlier season. A Sweetbriar hedge ran close by this border, and Multiflora Roses were also intermixed with the other Ramblers. Peonies are also very liberally employed, making this hardy flower garden a very delightful place.

Coming from this we pass by the residence over the lawns which, even in Lenox,

THE OLD FASHIONED FLOWER GARDEN AT WYNDHURST, THE LENON FSTATE OF W. F. S. GRISWOLD.

are famous, being smooth, well kept, without weeds or burned-up patches. As is the case with all the Lenox gardens the grounds are well planted with handsome evergreen and deciduous trees.

One cannot forget the beautiful formal Rose garden situated contiguous to the garden of hardy plants. Beds for flowers are also employed here, and it was somewhat of a surprise to find Gladiolus Brenchleyensise that had been planted in July in full flower in October, and very welcome, too.

And still another feature is found in the tennis court, which has a clay surface. This was made by first putting in 12 inches of coarse stones, 4 inches of cinders over these, and 4 inches of clay on top. The court drains to the center, where pipes take off the surplus water. Dustings of sand give good footing to the court, which keeps very dry always.

A very fine piece of planting is seen by the entrance of the house, so fine that it has been especially referred to in Bailey's Cyclopedia of Horticulture as a good example. The walls themselves are covered with the climbing Ampelopsis, not Veitchii, but muralis, a larger leaved

type, which also clings.

One cannot hope to mention all the good things that one saw even on a short visit, but returning to the glass houses it was a surprise and pleasure to find a collection of 500 Odontoglossum crispum in 5-inch pots, then in flower, rather an unusual time—but so excellent a plant is never out of season. These crispums are grown on raised wooden benches in a lean-to house facing north, and are kept moist, shaded and as cool as possible during the Summer. Very few growers can make a success of this species in the United States, but the plants here look certainly in a robust and healthy condition, and gave evidence of a fine crop. Ada aurantiaca was also in good shape, as well as batches of the other better known and more generally grown orchids which need not be named.

Rex Begonias are also somewhat of a feature, while of course, as becomes an ex-president of the Chrysanthemum Society of America, and still an active member of it, Mr. Loveless grows a large quantity of chrysanthemums, these being not in benches, but in pots. Since my visit the records of the Lenox Show have proved that the quality was all right.

Other houses are devoted to such crops as Wallflowers, Mignonette, Antirrhinums, Stocks, Sweet Peas, and Lupines, all in benches. These furnish flowers during the Winter, and a constant supply has to be maintained. The houses in which these are grown are mostly hipspan, the plants being at an average of a foot apart in

6 inches, or a little more, of soil.

As an Amaryllis grower Mr. Loveless has none that surpasses him, and it may be recalled that he exhibited plants at New York Spring Show, 1915, twenty months from seed. He believes in keeping the bulbs growing as long as they can swell up, and in ripening them off gradually. A bench was filled with large, plump looking bulbs that looked particularly happy, and which early in October had still some way to go, and they were doubtless being fed with liquid manure prior to drying them off and so ripening them completely for their Winter rest. Cross breeding is also done here, and a batch of 22 crosses, six plants of each, was pointed out.

The beautiful and graceful Calceolaria Clibrani, which grows  $2\frac{1}{2}$  feet to 3 feet high, bearing bright yellow flowers, is a subject that deserves to be more often met with. Possibly the new Cotswold Beauty will also be tried. Sweet Peas were then in 3-inch pots, and would

give flowers early in the New Year.

Another interesting subject was Geranium citriodora in pots, very fine bushes. A thing like this, when liberally grown, provides many "evergreen" sprays for putting in with the cut flowers. Well grown bushes are also fine in themselves.

Euphorbia jacquiniæflora furnishes its long, graceful, arching sprays of scarlet flowers in Midwinter, and is grown in benches, the cuttings taken in Spring and then planted out later; they are pinched once at least, and were 6 feet high at the time of my visit.

The Rose houses are first-class, and the original of the Red Radiance that A. N. Pierson, Inc., of Cromwell, Conn., has introduced, was seen here. It was from Mr.

Loveless that the Pierson firm got its plant.

Carnations are equally well grown, and in quantities to suit the somewhat large call for cut blooms.

The celebrated red Sunflower, one got from Sutton &

Sons, crossed with the variety Stella, gave further proof of Mr. Loveless's crossbreeding activities.

Everywhere there was evidence of well directed effort, crowned with success, and one left with the resolve to try and pay a visit there again as a future pleasure.

Ethwynd is the neat and well kept property of Mrs. Robt. Winthrop which, although not so extensive as some of the estates further west, has some good examples of gardening. It is here that Mr. Carlquist, a giant in the Sweet Pea exhibition halls, grows his remarkably fine prize-winning blooms. He and Edward Jenkins are the two most redoubtable combatants in Sweet Pea culture at the Summer shows, and together fairly well swept the

decks this year.

In the month of October, 1915, the trenches were being prepared for the crop of 1916. The same piece of ground has been used for a number of years, but a plan is kept, and where lines are this year will be the paths or alleys next year, the space between being the trenches and Pea lines in turn. There is no half measure here, but a sturdy man was throwing up the soil from the bottom to a depth of  $3\frac{1}{2}$  feet, keeping the good rich top soil on one side. Manure is well incorporated in the lower strata of the soil, which is then filled back and is ready for planting. The Peas are sown on February 1 in 4-inch pots and grown on slowly, being placed out in cold frames, and grown there until it is safe to plant them in the rows in April. The whole course is a thorough one, and is undertaken without the least doubt of good results.

Tulips and Narcissi in boxes, covered with 4 inches of soil, told of a goodly wealth of forced bulbs, some time in

the dull months ahead.

Indoors there was noted a very fine strain of Celosias, also tuberous Begonias of the finest English strains, both single and double, also the variety Golden Shower, which is so admirable for baskets.

The best types of English Peaches are also grown under glass, the recently introduced early Peregrine being highly spoken of. Very little actual forcing is done. The Peaches come in in June, and the supply continues until September. Some good pot grown Figs deserve mention, while in the kitchen garden department Mr. Carlquist is also particularly strong, almost as strong as he is in Sweet Pea culture.—ITINERANT.

( Fo be Concluded.)

## CONSOLATION.

I heard a tuneful thrush
Pour out his soul in song,
As though in all the world
There could be nothing wrong.

And yet the cost of worms
Perhaps might make him rue;
The mortgage on his nest
Perhaps was falling due.

But then, you see, a thrush Must sing, or else be still And silence is a fate We all consider ill.

So when you want to grouch And whine like everything, Be glad you're not a bird That simply has to sing.

## Things and Thoughts of the Garden

By The Onlooker.

Those of us who forgot to protect our more tender plants, thinking that the mild open weather would continue, got caught when the snow came, and the plants may have a bad time ere we can get at them again and put things right. In gardening he who hesitates is lost. Delay in shading a plant, delay in giving ventilation, delay in potting-on a batch of stock, or in pinching back at the crucial time-these things, just as much as delay in affording shelter from inclement weather, are all dangerous. Has the snow done harm to the large evergreens? Here again many a fine specimen has lost a branch or branches through the want of a little timely attention. A few men with long poles can, in an hour or two, greatly relieve the overburdened boughs of some of their weight of snow before the wind may rise. It is wind, ice and snow, or simply wind and snow together, that does the damage, but the efforts even of feeble man can assist the trees and tide them over a difficult period (sometimes).

At the Zoological Garden, the Bronx, N. Y., there are some very interesting and beautiful Box edgings, just as there are at George Washington's old home at Mount Vernon, Va. Those at the Zoo are "boxed" in; in other words, a framework is nailed longitudinally over them and on and over this are placed Spruce branches. In this way the true symmetry of outline is rigidly preserved. The same idea can be carried out in protecting borders of tender or barely hardy plants. The air space between the top protection and the soil is valuable in itself, at least I presume it must be, on the same principle that the double light sashes are valuable. It is the layer of air between the upper and lower lights that acts as a preventive to excessive or too rapid radiation, the principle of the thermos flask.

Who finds Lavender hardy with them, and what are the winter conditions in your section? In northern New Jersey there are several gardens where this plant comes through the winter victoriously, while in New England it fails. Is Massachusetts so very much colder than the region west of the Palisades? In any case this is just one of the plants that is worthy of all the care we can give it. It has the history and memories of ages clinging around it. Let us have "sweet Lavender."

This latter paragraph brings to mind the sight and fragrance of several "scented gardens," a feature that, like several others, might well receive attention. A very excellent book by Donald MacDonald entitled "The Scented Garden," was published some years ago in England. Mr. MacDonald was at one time manager of Carter's seed store at Holborn, and left to devote himself to journalism, becoming garden correspondent of the Daily Telegraph, one of the great London dailies, and I presume he is there still. Another fertile writer and gardener of good repute who wrote a very fine series of papers on scented plants, on perfumery, on essential oils, and on the whole botany, history and literature of the subject, was the late F. W. Burbidge, of Trinity College Garden, Dublin. His papers were published in the Journal of the

Royal Horticultural Society. While I did not set out with the intention of relating these few facts, nevertheless they may serve to show that this subject, like nearly every other in our gardening profession, has its special literature, and the more we go into the study and discussion of things, the more diverse and interesting we find them. An attorney took up wild flowers as a summer study and pastime, thinking he might soon know nearly all there was to know, but after several months of pretty careful work, he began to feel, as Newton did, that all he had yet picked up was as a few pebbles from the shore. Among the annuals that can be utilized in a scented garden are Marguerite Carnations, Petunias, Mignonette, Heliotrope, Leptosiphon Douglasii, Night-scented Stock, Nicotiana, Sweet Scabious, Verbenas, Sweet Myssum, and also the following plants: scented Pelargonium, Pansies, Roses and Lemon-scented Verbena (Lippia citriodora).

Professor F. A. Waugh, of Amherst, Mass., delivered an interesting address at a meeting at which I had the pleasure of being present last spring, his subject being the advantages, utility and beauty of dwarf fruit trees in gardens. It is safe to say that there are really very few dwarf trained fruit trees in our American gardens. They require constant care and skilled handling, while reliable, well-trained help is scarce. Probably this is the chief reason why this class of ornamental and useful garden fruit tree is absent from our places. All the same, it is a pity it is so, for the lines of espaliers or cordons along the back of the flower borders or dividing the kitchen garden quarters are a very satisfactory sight, good to behold, adding greatly to the garden features.

I was interested in reading recently one of the official reports published by the Department of Agriculture, dealing with trade at the port of Archangel, northern Russia. That report stated that in the northern part of Finland very little ice forms in some of the channels of the sea there, but the White Sea, in which Archangel is situated, becomes solidly frozen; the explanation being that in Finland, which is but a small way to the westward of Archangel, the influence of the Gulf Stream is still sufficient to make the difference between ice-blocked harbors and the opposite. Some folks are prepared to deny that the Gulf Stream has any influence on the climate of Western Europe. They would deny, possibly, that Halley's Comet exists because they have not seen it.

One reason why the New England Coast, especially the northern part of it, is so cold in winter, even although the latitude is further south than that of southern England, is owing largely. I believe, to the Labrador Current, a cold current that comes sweeping down from the Arctic seas, and which heads off, as it were, any good effects that the Gulf Stream might driuse

Not having been at the annual convention of the National Association of Gardeners, and not yet having seen the published accounts of the proceedings, I am unaware of what took place. As a member of the craft and of the association, I earnestly hope that

something was said or done in relation to three chief things, namely: 1, facilities for gardeners acquiring technical education; 2, protection of the bona fide professional gardener against untrained interlopers, thus reducing the status of the calling; 3, provision for sick, disabled, or indigent gardeners—a sort of old age fund. The time seems to be ripe when the whole body of gardeners in this country should unite in this association and fight for certain ideals that are agreed upon by the whole membership. One of the best would be the provision of a fund whereby the needy old men of the gardener's calling could be provided for, or at any rate, they would feel that their last days would not be desolate or in want so long as the association existed. Secondly, the young men should have provision for the intellectual part of their training; this at times now is difficult of realization.

#### "ONLOOKER" ANSWERS "BYSTANDER."

So I have at least one close reader of these discursive notes on "Things and Thoughts of the Garden," one who signs himself "Bystander." I will answer his 'questions as briefly and as well as I can. "Bystander" thinks that in sowing Sweet Pea seeds in the autumn, "the idea is that the seeds remain dormant all winter, as the germinating power of some seeds is improved after being subjected to frost in the ground." I would rather keep my seeds in the bag all winter and place them in a little sulphuric acid in the spring if it were merely a matter of getting "improved germination." Sulphuric acid is now recommended for over-ripened or very hard-shelled Peas, the seeds being immersed for a very brief period in the liquid, when it is found that the testa or outer coat ruptures readily. Sweet Peas are sown out of doors as late in November as possible or practicable to insure germination taking place, yet to prevent more than half an inch of growth. If the plants are sown much earlier than this it has been found by Mr. Kerr at Burpee's trial grounds, and also at Cornell, that too much growth is likely to result, and hard frosts coming, nip the plants back and rot sets in. By the end-of-November-sowing, however, the small stubby growth lies too low to get easily hurt, and moreover, is readily protected with the straw and soil. As regards the root growth, no one could expect lively root action or any action "through the frost-bound winter months;" yet just as all good bulb growers like to plant their tubers in time for the roots to strike far down before the top growth makes much headway, on the same reasoning do the Sweet Pea men sow in autumn. It is on this basis and with the idea in their minds of giving the seedlings the opportunity of "getting away" whenever the weather is at all favorable at any time in the winter and spring, that autumn sowing is practised and advocated. The Sweet Pea is a hardy annual and will bear a great deal of punishment before it succumbs, albeit it will often fail in the winter, but those that come through are so sturdy and deep-rooted, that not only do they flower much earlier than those put out even from pots, but they last longer and better during dry spells, have superior blooms, and on the whole resist insects and disease better. For these reasons autumn sowing is considered worth the time, labor and chances.

"Bystander" then turns to an entirely different matter, the vexed question of plant names. Scholars have told me that plant nomenciature is "anyhow," meaning that there was no uniformity or true agreement

in the terminations, the application of the genders and such like. Perhaps one would have to apply to Max Müller or a Prince Bounaparte, each of them famed etymologists, for an answer, but we of the garden have enough to do without troubling over these very abstruse considerations, interesting though they undoubtedly are. I certainly do not think, "Bystander" (in answer to your question), that plant naming is complete and final as we have it today, and I am not averse to a name being changed if it has been rendered necessary by the introduction of new species which, as we all know very well, fill up previous gaps between other species or even genera, and show them to be co-related members or mere varieties, as the case may be. Sometimes a recasting may be necessary, but I think the time is past when any great amount of this work is actually essential with our chief garden or cultivated genera. But I certainly do strongly object to seeing names—yes, the ones he talks of as having been handed down from father to son-altered for a mere whimsical reason or merely to flatter the vanity of some rising young botanist with a desire to see himself shine in the Annals of Botany, or similar publication as the restorer of some long-lost name, or as the recaster of a genus, thus giving him a chance to rename a couple of species or maybe a whole series of them. For be it remembered these changes can seldom be made without disturbance elsewhere. Believe me. "Bystander." I have seen and heard on this subject more than I would care to state in THE GAR-DENERS' CHRONICLE. In connection with my protest against the useless, harmful, and totally unnecessary changing of the names of well-known garden plants, ask intelligent nurserymen what they think about it, ask the seedsmen who have to keep their catalogs straight, ask the gardener in charge of a large place and who also has the farm to look after, and see what they think of the changing of well-known names. One thing they do think, and that is that they, as the everyday commercial and private users of plant names, have some propriety in them, indeed quite as much as the botanists. Let me conclude with a quotation from a paper or address by Prof. L. H. Bailey, which I have seen, in a contemporary in which he said: "The present situation in nomenclature is a vivid illustration of the failure of arbitrary means of standardization. We should recognize more fully 'the principle of usage' which, in the end, controls all language. We have probably made a mistake in trying to substitute arbitrary priority for stability; at all events, we might have saved ourselves the very amusing exercise of trying to upset well-established names for the purpose of substituting an older one in order that we might make the name staple. It looks as if usage were, after all, to triumph in the end and in some regards quite independently of arbitrary regulations. The principle of undeviating priority has not yet controlled for any length of time in the development of language. It is a false premise. The public has real rights in the names of plants." Perhaps the professor could have said what he had in his mind in a simpler, clearer fashion, but at any rate he says, as your humble scribe does too, that the botanists ought to consider the confusion and harm their name-changing does, which. were it followed, would outweigh the scientific value of it. But they so often change—not once or twice even, but several times. Look up the long string of synonyms that many plants have and ask yourself who's going to try and adopt every new name these systematists chose to adopt. Let's have a name and the author of it and stick to it, change it who will.

## The Profession of Gardening?

By W. W. Ohlweiler, Missouri.

The question mark is intentional and means to call forth the query as to what the profession of gardening if there be such a thing, really is! A profession is something or other that off-hand we have learned to associate with something genteel, as, for instance, law, medicine, theology, politics, etc. One idea of a profession is an occupation that involves considerable education or its equivalent, and requires mental rather than manual labor. Being professional is to our mind a matter of learning, and learning implies more or less an absence of manual labor. But no one for a moment would try to differentiate between gardening and work. Gardening implies work and plenty of it. Are we really justified then in calling gardening a profession? Our dictionary defines gardening as an art having to do with the planning and executing of garden work. In other words it is horticulture, and horticulture is but a part of the large science of agriculture dealing with the more intensive methods of enclosed spaces. Art, however, implies the practical application of knowledge or natural ability, skill, dexterity, facility or power. It may also imply a system of rules devised for procuring some scientific, aesthetic or practical result, i. e., a branch of learning to be studied in order to be applied. On the other hand, we distinguish essentially between the fine arts and the useful arts, the former suggesting largely the exercise of the imagination, and the latter applying to the arts of utility which require chiefly manual labor or skill, and which engage the ingenuity of the artisan. If then gardening is an art and of this, then there hardly seems to be any question, it must be both a fine and a useful art, and one's definition has much to commend it for to repeat, "gardening is an art having to do with the planning and The planning calls for the execution of garden work." display of all those finer qualities of the imagination that are usually associated with the finer arts, while in the execution of the plans that the use of the fine arts have produced, we have every chance to display personally ability and power. Gardening then is not merely an art, but is an art that must be studied and studied well in order to be applied. Since a profession indicates a certain amount of learning we may safely refer to gardenmg as a profession, but it is a profession that calls equally upon the mental and manual faculties of the individual. Just as it is both a useful and a fine art, so it is both a mental and a manual profession. Gardening therefore needs no qualification, it stands in a class by itself and embodies the qualifications of preparation and utility that some professions unfortunately do not. It is not one sided or incomplete, it is a law or an art unto itself. Gardening is an artistic profession!

If we have allowed ourselves too high an ideal for our life's work, i. e., if we have held that true gardening requires something more than mere physique and muscle; if it requires that a man's brain shall labor equally with his muscle power, then we must obviously revise our conception of what a gardener really is. However a gardener may be either a person skilled in gardening, or merely one who tends a garden, but it seems as if a little reflection would show that it is hardly fair to consider the man who merely tends a garden as in the same class with one who is skilled in gardening. The two types are essentially different, and in desiring to make the distinction clear and concise we are only exercising the

same prerogatives as any other profession or trade. Too many men who lack the initiative and ability to plan for the care of gardens claim to be gardeners and unfortunately are regarded as such, simply because they happen to be doing some laboring in and about a garden. And this class of labor does not hesitate to make application for work as gardeners, and feel that having worked in a garden entitles them to consideration as efficient gardeners. A filing clerk would hardly assume to apply for the position of head bookkeeper. The thousands of laborers in and about large engineering projects make no pretensions of being civil engineers. There is as much connection between the average garden laborer and the gardener as there is between the printer's devil and the editor. Let us draw the line at once and for all time. Potting plants, sowing seed, spading beds, trimming hedges are merely phases of garden labor that we might more clearly designate as manual labor, and in this connection we might remember that in a profession and especially an artistic one, manual labor is the result of and not the moving force. Gardeners should be as jealous of the high ideals of their profession as the members of any other profession, and the person who is not qualified by training and experience to assume the planning and execution of garden work, should soon be shown the difference. But lest we place ourselves open to a wrong impression, we must admit that training and experience do not necessarily come through our institution of learning. Experience is the longer school, and without doubt the better one in the long run, but all the experience in the world without the enlightening influence of close study will not make a gardener of any man. Institutions of learning, owing to their system of supplying the results of their experience, have made the long road of experience shorter by many years, but with this help as a starter, there remain many things to learn. Study and training are but short cuts to experience that are the trend of modern education, and it must always be borne in mind that an education in itself is but a poor makeshift to any professional man. Education or experience in itself does not signify nearly as much as the two together. One tempers the other, and in their union there is strength.

Gardening, however, as all other lines of endeavor may have for its specialties any one of which may present sufficient incentive and field for study to take up all of a man's time. But the general field of garden education should be required of any man taking up one of the gardening specialties. We have lawyers who are considered specialists in criminal law, in civil law; we have lawyers who have specialized in law applying to corporations. In botany we have plant physiologists, plant breeders, morphologists, systematists, sociologists and the like. In gardening we have truck gardeners, market gardeners, flower gardeners, florists, foresters and landscape gardeners. With the last we are principally concerned.

Knowing well by this time the emphasis that we have placed upon gardening as a profession, the word landscape in this connection has no more significance than the word truck or market. The gardener is the essential part and the profession of gardening the dominating feature. Landscape gardening merely signifies a specialized form of gardening. We are therefore forced to admit that in the majority of cases the term landscape gardener

COULD ANY BULLAN ARTISTIC MINE PRODUCT THIS NATURE PICTURE, THE WORK OF JOHN MCLAREN IN GOLDEN GATE PARK, 85N URANCISCO: SUOULD NOT GARDENING BLOCKASSED AS A PROFESSION, A SCIENCE AND AN ART?

is not just what it seems. Landscape architect or landscape designer would be more appropriate in every way, since the efforts of the person referred to are devoted mainly to design. In a way there is the same relation between the designer and the gardener as there is between the building architect and the contractor. The two are specialists in their own way. We have the specialties of designing and architecture contrasted with those of gardening and building. But while there is an apparent similarity that may well be kept in mind in many of our dealings with the professional designer there is a difference that should never be lost sight of. A building architect is called upon to work in certain proportions that through custom have been shown to call forth pleasing combination. He may alter these combinations of proportion and balance for certain well defined reasons. He can fix the color harmony fairly definitely because of the material he sees. He can alter existing color schemes as he wills by the use of paint. He can call for texture and for high lights where he wills because his material is inert and susceptible to definite and practically permanent form. The landscape designer works along the same lines as regards proportion, color and texture that the building architect does, but unless he is a rightly good gardener he cannot indicate his materials with the same ease that the building architect does. The building architect's materials are not so numerous, and are not affected by form changes as are plant materials. The building architect calls for red brick and the clay for them may come from Dakota or Louisiana. It matters not. The landscape designer usually calls for a definite shrub or tree that he happens to know will answer the purpose for that locality. When he changes his locality then he must learn his materials anew. And because his time is devoted to the design and ultimate effect primarily, he is not apt to accumulate any wonderful storeroom of knowledge of material. I have often felt that the ideal solution from the gardener's standpoint at least, would be for the artist to design his picture along the lines of some standard of texture and color and height, and then let the gardener indicate the plants to produce certain effects. It is the gardener's business and from his training he is more properly fitted than any one else could be to do the work. However, few designers would have the patience or the ability to carefully design their shrubbery masses along the lines of texture, color and form, and they find it easier to suggest materials from their scant storehouse, when the gardener could, if he could ever find what was really wanted, supply the material best suited to the purpose. It leaves us open to the conviction that plant masses are either monotonous repetitions of common plantations, or else have never been given the attention that they deserve, and it is to be hoped that when the day comes, that gardeners tire of seeing plant material subjected to the indignities of improper association, then the gardeners will insist on knowing what it is that the artist is trying to paint. The picture should be painted from the ideal of the artist. The pic ture should be executed from the knowledge and the vast experience of the gardener.

Specialization is one of the characteristics of any profession, and as noted before has entered largely into that of gardening. However, specialization in phases of gardening has not always required or induced that general training and knowledge of the profession as a whole that has been required of other professions in which college courses and degrees have signified definite lines of study and definite preparation. The tendency of the times is to recognize the distinctive character of gardening and to require of it a preparation that will have a general ten-

dency before specialization does finally set in. The value of this general training along horiticultural and agricultural lines can hardly be estimated, but graduation from the horticultural courses in institutions of good standing should be perquisite, and degrees in gardening should carry as much weight as they do in law, medicine and the like. It is only a question of time when as much thought will be given to preparation for the profession of gardening as for any other profession. Then, too, such general preparation is necessary in order that there shall be the broadness and openness of outlook and thought that should permeate the members of all professions. We should be interested in and in sympathy with the things pertaining to gardening in all fields. Our vision should be broad enough to appreciate the aesthetic or the practical side of a profession. It should be broad enough to be equally interested and conversant with the problems of plant breeding, of botany, of physiology and of entomology, zoology or geology. Narrowness of thought is not compatible with a profession that had its beginnings in the cons before human life began and that has been shaped and formed by all the present and past forces of nature. I ife and the elements have all played their part in gardening, and history has from time to time shaped its course, and today it is as full of the spirit of life and of promises for the future as it has ever been. He is a poor gardener indeed who can fail to be inspired with the reality of his occupation, or who can fail to get from association with it, the purity of thought and the honesty of purpose that should be a part of any natural profession. Broadness of purpose makes us better companions and Letter workers, for association with nature does just that.

But in closing let me add just a word or two in regard to that side of gardening that tends to be in reality manual labor. It seems to me that in the final analysis all things are learned through work. Work may be mental or physical, but either way it is work. However, these things that one learned through practical experience seem to have a firmer grip upon our memories than do those things that are learned mentally. The child learns through association of objects and symbols, through the sense of sight and smell and touch. Being merely told that the stove is hot does not suffice to keep the fingers away, but the pain of contact teaches a lesson that is not forgotten. So in gardening our mental lessons have their value, but the association with real work gives us a knowledge that later on will temper us in our attitude toward the garden laborer. We will also have the security that comes of really knowing how, and the day's work will have more of life in it for the knowing. As success attains our efforts and as the days of real work give place to the forces of supervision and direction there will come to you at times an intense longing to once more get the feel of the soil in your hands, to hoe and spade and to be up and doing. The gardener longs for the intimate association with his work, he must be near nature, but in time he will get to feel that the directive forces of his own mind are accomplishing things through the many fingers of others, and that one little mind with many helpers is doing the work that feeds the millions when they are himory and that gives them comfort when they are in need. Ours is a profession of which we may well be proud, for it gives of itself, and it prospers in the giving. Through life it gives us strength and happiness, and when old age calls us to its border line, it still gives up to us new secrets and new ideas. It is a fountain of eternal youth. It is really "an artistic profession."

## THE ORIGIN AND MEANING OF CHURCH DECORATIONS AT CHRISTMAS

I think there is very little doubt that one of our oldest and most general customs is that of decorating our churches with evergreens, berries and flowers at the season of Christmas. Pre-reformation or post-reformation, writes Joseph Jacob in *The Garden* (English), evangelical times or catholic revival, town or country, made only a difference in degree. Wordsworth, John Gay and Robert Herrick, to mention three poets of different ages whose knowledge of country ways and doings is proverbial; Samuel Pepys and John Evelyn, the diarists of Cromwellian and Stewartian times; the fifteenth century congregation of St. Mary-at-Hill in the City of London (as we know from their own or from other written contemporary evidence); all saw their churches decorated for the brthday of Our Lord, and although it is only a surmise, it is well within the bounds of probability if I suggest that the Venerable Bede, Bishop Swithun, Alban and Martyr, or Becket, the murdered archbishop, must also have seen the same emblems of joy and love when they entered God's House on a Christmas morning. Undoubtedly Holly and Ivy are the two plants which always have been, and which still are, associated more than any others with the Nativity. Although the orderly sequence of appropriate and distinctive decorations for the changing seasons has long been a dead letter, we would feel there was something missing were we to see none of the familiar leaves and trails somewhere in the wreaths or devices of today.

> "The Holy hitherto did sway; Let Box now domineere. Until the dancing Easter-Day Or Easter's eve appeare."

Our own feelings are sufficient to account for the origin of the practice. There is a seemliness in making the external correspond to the inward on occasions of joy and grief. There is something in the fitness of things that connects decorations and best clothes with days of peculiar importance or the entertaining of guests. It is this, for example, which must have suggested the parable of "The Wedding Garment" to Our Lord, and which must have made its meaning so clear to His hearers. Hence we can see why Christmas has always been associated in the minds of Christians with outward signs of joy both in their homes and in their churches. Impossible but that it should be so. Why, though, Holly and Ivy? What gives these two plants their peculiar position, more especially the first? Two explanations are offered: First, it may be a relic of the old heathen festival of the Saturnalia, which happened to be celebrated at Rome about a week before the Christian Feast of the Nativity. At this time friends gave one another branches of Holly as an expression of their goodwill, along with the presents which it was customary to send. What more natural than to transfer ths innocent custom, with its ready-made meaning, to the great festival of the anniversary of Him who came to bring peace on earth and goodwill among men? Or, secondly, its use may have arisen from the practice of the Druids, who invariably hung in and around their dwelling places bunches of Holly or other evergreens, in order that the spirits of the woods might find a shelter when their customary abodes were leafless and when the weather was particularly severe, as it so often must have been about the time of the old Christmas Day.

In judging which of the above suggestions is the more probable, it is well to bear in mind two facts: One, the universal association of Ivy with Holly as appropriate

for Yuletide decorations. Church accounts for 1486 (St. Mary-at-Hill, London) are extant which include "Holme and Ivy at Christmas eve," and for 1524 (St. Martin Outwich, London), which have "Item: for holy and ivy at Chrystmas." This may possibly be a relic of the Saturnalian times at Rome, when there is very little doubt men were apt to drink "not wisely, but too well," and when it is certain Ivy wreaths, with their supposed power of lessening the intoxicating effects of wine, were in much vogue. The other is the strange fact that the only plant which, as far as I know, is now absolutely taboo in church decorations is the Mistletoe, the sacred plant of the Druids, cut with imposing ceremonies and with golden knives and with wide renown for its powers of healing. I am however a little doubtful if this has invariably been so, for John Gay (early eighteenth century), who was intimately acquainted with rural life, distinctly says in one of his poems this was so used; thus:

"Christmas, the joyous period of the year, Now with bright Holly, all the temples strow, And with Lawrell green, and sacred mistleto."

If Mistletoe was ever admitted as equally suitable with Holy and Ivy as part of the Christmas adornment of our churches, then probably the Druid origin is the true one. If, on the other hand, it was not so, then the Saturnalian is the most likely one, more particularly when the association of Ivy with Holly is so universal. Personally, I favor the Roman origin as being on the whole the more probable.

A word in conclusion about the factors in the Christmas decorations. Nowadays we use everything that comes to our hands. Yew, Bax, Laurel, Cupressus and Thuya are more often, I expect, seen than not. But it was not always so. In the days of Herrick the poet (time of Charles I) there was a certain well-defined sequence of plants which were to be used for the different seasons, and there is no reason to suppose that the rota was not strictly adhered to. He thus writes of house decoration:

"Down with the rosemary and bayes, Down with the mistletoe, Instead of holly, now upraise, The greener box, for show.

Then youthfulbox, which now hath grace Your houses to renew Grown old, surrender must his place Unto the crisped yew.

When yew is out, then Birch comes in, And many flowers beside, Both of a fresh and fragrant kine, To honour Whitsontide."

In another poem on the same subject the poet seems to allude to the old idea of the evergreens being originally put up as shelters for spirits:

"Down with the rosemary, and so Down with the baies and mistletoe; Down with the holly, ivie, all Where with ye drest the Christmas hall; That so the superstitious find No one least branch there left behind; For look, how many leaves there be Neglected there, maids, trust to me, So many goblins you shall see."

From this last quotation it seems possible to suggest a third idea as to the origin of this Christmas custom of decorating churches and houses. With regard to the former, it may be that the Holly and Ivy are direct descendants of Saturnalian times, and came to Britain ready-made, as it were, with Christianity; while, with regard to the latter, the decorations may be but the continuation of what was once universal throughout the land in the days of the Druids. This, at any rate, would account for the use of Mistletoe in houses, while it is never found in churches. Gay's assertion, though, wants explanation.

#### THE MISTLETOE

BY WHIARD X. CICIF, ILLINOIS.

The traveler from a more northern region, who hap pens to journey into our Southern States after autumn winds have stripped the leaves from the trees, is likely to observe shortly after he has crossed the Ohio River or passed through the region in our country in the same general latitude, and there is still more or less green in the treetops. At first glance it appears as if, here and there, groups of twigs had failed to conform to the general condition of leaflessness and were still sporting their summer verdure, but a second survey convinces him, especially if he be botanically inclined, that he is getting a view of that famous plant, the mistletoe.

To most dwellers in the South, the mistletoe is no rarity, but to less accustomed eyes, these more or less globular balls of green among the leafless branches are likely to be of more interest. Though we no longer hold the mistletoe in superstitious reverence as a protector from witches, ghosts and demons, and have perhaps cause to doubt its efficacy in certain amusements of the winter holidays, we may still find its curious manner of growth sufficient warrant for more than a passing interest in it.

The common mistletoe, whether European or American, is really a shrub, but it always grows as a parasite on some other woody plant. In Europe it has been found on the walnut, poplar, linden, elm, locust, willow, ash, thorn, pear, apple, mountain ash, oak and almond, as well as upon various species of conifers, and in one instance, at least, it has been found parasitic upon another plant of its own kind. Our native plant is nearly as catholic in its selection of hosts. Both species are fond of trees with soft, sappy bark and thrive best on such specimens. The seeds are covered with a soft and exceedingly sticky pulp which causes them to adhere to the feet and bills of birds that feed upon them, and this substance also serves to attach them to the branches of other trees in the proper position for growth. The cotyledons contain chlorophyl and it is said that the seed will not develop unless it is exposed to the light, an apparent provision of nature to ensure that growth shall not commence until the seed is advantageously situated.

When the mistletoe begins to grow it sends a sucker-like root, called a "sinker," into the soft tissues where wood and bark meet in the body of its host, and takes therefrom part of its nourishment. The fact that its leaves are green shows that it is not wholly dependent upon its host for food, but the green is of a yellowish and sickly hue and of itself proclaims the plant to be a parasite. Since the trees parasitized by the mistletoe annually add new layers of wood and bark to the trunk, in the ordinary course of events the parasite would soon be covered by the increasing bulk of the tree. The mistletoe, however, is too adroit to be so easily overcome, and just as the encroaching wood threatens to bury it, side

roots are sent out which penetrate the bark lengthwise of the stem, and these send out new "sinkers." This process is repeated annually during the life of the plant

The beliefs which were once associated with the mistletoe originated long before the dawn of history. The plant held a prominent place in the Druid rites and was gathered for their winter festivals by a white robed priest who cut it with a golden knife. It was received in a white cloth; to let it touch the ground being counted disastrous. When the priest had given it to the people it was hung up over doors and in other places about the house to keep off evil. From its connection with such heathen rites, its use was long forbidden by the Church. In Norse mythology, the blind Hodur is fabled to have killed that darling of the gods, Baldur, with a spear tipped with mistletoe, it having been decreed at his birth that nothing that grew on the earth should harm him. The other gods combined to bring Baldur to life and the mistletoe was ordered never to work harm again, to which it agreed, provided it was not allowed to touch the earth. Thus we still hang sprays of the plant high at Christmas time as an emblem of peace and good will.

Our mistletoe is one of some four hundred species of the Loranthaceae, most of which are found in the warmer parts of the world. The flowers of our plant are small and insignificant, but several tropical species are more fortunate in this respect, having brightly colored blossoms which are often six inches or more across. The European mistletoe is known to science as *L'iscum album*, while the American plant is Phorodendrom flavescens. All the beliefs and customs which are connected with the mistletoe by right belong to the European species only, but our plant is so like the overseas species that only the scientist would notice the difference. Its use at Christmas time, therefore, may go unchallenged, partly because the scientist usually does not extend his investigations to such untechnical matters as holiday merrymaking, and partly because of the old proverb that "When one has a mind to do a thing, any excuse will answer.'

Edition There a Ring C

#### A Christmas Garland

III RI once was a Maiden, who, all would allow,
Was otherwise blameless of folly,
That couldn't tell holly from mistletoe-bough
Or mistletoe-berry from holly!

III R1 once was a Garland with berries like pearls (It might have been wise to ignore it); The Maiden, who needed a wreath for her curls, Believed it was holly—and wore it.

III KI once was a Youth, unaccustomed to look for Frohish and vormal courses; And still, having studied his botany book, He knew all the plants and their uses.

### HERE once was a nook on a shadowy stair;

And Maiden, and Garland of glory.

And youth were all present, but I wasn't there,

So how can I finish the story?

#### POSSIBILITIES IN LANDSCAPE FORESTRY.

By Arthur Smith, Pennsylvania.

(Continued from November.)

Stress has been laid upon the use of native plants for woodland gardening, which, being so numerous and beautiful, renders exotics unnecessary, and the latter as a rule do not fit in with wild surroundings. Of course, there are some exceptions to this, two of which we cannot forbear mentioning; the Water Forget-me-not, Myosotis palustris, and the Foxglove, Digitalis purpurea. The former soon makes itself at home by the side of water, spreading over shallow spots; a position where it has a few hours sun is preferable; and the native habitat of the latter is on the borders of, and open spots in, woods. Both are easily started by seed and rapidly spread.

For the restoration of the native woodland flora, sowing seed is an easy and effective method. The mere scattering of all kinds of seed in an haphazard manner, upon rough ground more or less covered with grass and weeds is, however, of little use. Little patches of ground should be cleared of stones, etc., at intervals, and the seeds systematically sown and covered. Until established, the encroachment of briars or anything undesirable should be guarded against. This way is very convenient when one comes across a plant in some other locality that is not native on his own place, as seed is easier to transport than a plant; this of course presupposes the plant to be bearing seed at the time. It is not at all a bad idea to start a seed bed in the garden for the purpose of growing wild plants that cannot be collected in sufficient quantity. Seedlings treated in the orthodox manner should result in a stock of thrifty plants which would easily transplant into their permanent quarters. In a wild garden once established in the woods and which has had some care, natural reproduction would go on as a matter of course, always provided the selection of plants suit the soil. In the case of a choice or rare species, it is little trouble to make up a small area of ground into a condition to suit the plants.

There is an important point in connection with our subject, which is the putting the woods into a sanitary condition. Necessary drainage, as before mentioned, is one item to be attended to. In woods that have been uncared for, dead trees and limbs will invariably be more or less numerous, harboring insects and fungous pests; therefore from this, as well as the aesthetic, standpoints, they should be removed or burned. Dead branches of small dimensions may be broken up and spread about in the interior, where they will soon decay away and increase the covering of humans.

In woods to which the general public have no access, fires started from the inside are not likely to occur, but if there is any possibility of a fire coming in from outside, provision should be made to guard against it. When woods adjoin those owned by others, a lane should be kept clean between them, which should be either plowed once a year if possible, or the weeds and leaves kept cut and burned. Of course common sense judgment should be exercised in connection with this and other burnings. The estate should be guarded by a stout, tall, woven wire fence, surmounted by one or two strands of barbed wire. Property which is worth going to any expense over is certainly worth proper protection.

The treatment of damaged trees, whether caused by disease, storms, or old age, and which are worth preserving, comes under the head of landscape forestry.

The work in connection with this has recently caused a new profession to spring up under the term Tree Surgery. Like many other new things with money possibilities in them, this profession contains an infinite number of charlatans. I do not say that there are not some expert tree surgeons who thoroughly understand the work of treating the wounds of trees and pruning them from A to Z, but the fact that hundreds of tree owners have been badly bitten and that ninety-five per cent. of those claiming to belong to that profession can only be classed as tree butchers is well known.

There is no secret process connected with tree surgery, and any estate manager worthy of the name should be competent to carry out operations connected with it, without the owner calling in an expert; especially when the majority of the so-called experts know less about it than the estate manager, who admits he knows nothing.

While this article has reached to a greater length than was originally intended, we have merely touched upon the leading principles connected with the subject. The carrying out of details will call for different methods, according to local conditions. The work involved in landscape forestry does not call for any great expenditure of money, and it may be spread over a more or less extended period. In any case, it is better to make haste slowly; taking time to thoroughly study the topography of the woods to be dealt with, so as to open up and make the most of the natural beauties which exist, resting on the assurance that work along the above lines will be permanent not evanescent.

#### IS "LANDSCAPE FORESTRY" A MISNOMER?

December 4, 1915.

Editor, GARDENERS' CHRONICLE:

Will you pardon me if I make a comment concerning an article which I saw in your magazine, November, 1915, entitled "Possibilities in Landscape Forestry"? During the eight or ten years of my experience in connection with Landscape Gardening work, and especially in teaching phases of this subject, I have found that the general public is often misinformed as to the nature of the work. This misinformation comes largely from the incorrect use of terms as shown in the heading of this article on page 495. I often find that students enter in Forestry courses in universities expecting to receive training in professional Landscape Gardening which will prepare them to take the position of superintendent of parks and private estates where the ornamental value of trees is the chief care. Forestry is a subject which treats of the study of the internal structure of plants for the production of the largest amount of good timber and lumber and is almost diametrically opposed to production of an ideal ORNAMENTAL specimen, since it is more important to produce a straight clean trunk to a considerable height from the ground than to produce an attractive ornamental specimen. Ornamentally, we deal with external structures of trees, paying particular attention to the arrangement and balance of limb structure and to the NATURAL shape of a tree, and we prune with the idea of increasing or lightening the shade or to increase the amount of flowers and fruit. In many instances it is desirable to have a tree which branches quite low, especially for lawn shade, and evergreens should always retain their lower limbs as long as possible.

Of course so far as the entomological phase of the work is concerned, or insofar as the principles of tree repair, or surgery as it is sometimes called, are converned,

they may be applied to both Lorestry and Landscape Gardening. It seems to me, however, that we should avoid any confusion of terms as between Forestry and Landscape Gardening in just the same way that we have found it of importance to establish definite generic names for plants.

From my experience in connection with the Department of Landscape Gardening at Cornell, Illinois, and Missouri, and from having discussed this identical question of the conflict and overlapping of the courses in Forestry and Landscape Gardening with such men as Waugh, Robinson, Wilhelm Miller, Geo. Kesler, O. C. Simonds, L. H. Bailey, Schrenck of Biltmore, and a number of others, I find that there is substantial agreement that where it is a question of the ornamental value of plants, either of individual specimens or even small groups of trees, that it should be treated from the standpoint of landscape gardening and not forestry. There is a limited demand for the professional forester in this country, yet the simblicity of the term enables Agricultural Colleges to obtain more funds from their State legislatures for the support of this work than for landscape gardening, hence they can employ a larger teaching force. We thus find that as the number of students who wish to become protessional foresters is particularly limited, the Department of Lorestry has taken over many of the courses which should be offered under Landscape Gardening, but are tryin, to leach them from the forestry standpoint. It is like the doctor who attempts to treat toothacke when he had that his patients are troubled this way more often than by measles.

It is this question of foresters and practical gardeners attempting to do professional landscape gardening that has had a tendency to put this latter work under suspicion.

HORACE F. MAJOR, Missouri.

#### TRANSMIGRATION.

In New Jersey one morning Perkins looked over his tence and said to his neighbor:

"What are you burying in that hole?"

"I'm just replanting some of my seeds, that's all," was the response.

"Seeds!" exclaimed Perkins angrily, "It looks more like one of my hens."

"That's all right," came from the man on the other side of the fence. "The seeds are inside." Exchange.

A B DUKES EXHIBIT AT HORTICULTURAL SOCIETY OF NEW YORK EXHIBITION

The flower, frint and vegetable exhibit from the farm of J. B. Duke, Somerville, N. L. stared by his Garderer, A. V. MacDonald, at the annual Chrysanthemum Show of the Horti ultimal Society of New York, in the Moseum of Natural History, New York City. The exhibit was much appreciated by the visitors to the show and was awarded the society's gold metal. The fountain was banked with Cattleyas, Red. Begonias, Pandanus, and other foliage plants. On either side of the fourtain were displays of the fruit and vegetable products of Duke's Farm, while banked in the background of palms and ferns were large chrysanthemum blooms and beautifully colored crotons.

#### Work for the Month of January

Conducted by Henry Gibson, New York.

#### OUTDOOR OPERATIONS.

Active outdoor operations during the month of January are somewhat limited, but of those that can be performed, the pruning of fruit trees is perhaps the

most important.

The object of pruning a fruit tree is to increase its yield of fruit, enhance its beauty and secure fruit of better quality. For a tree to produce well developed fruit it must have sunshine and air. Therefore when the limbs become so numerous that sunlight is excluded and the foliage so thick that the air cannot circulate freely, then the top must be opened up by cutting out the superfluous limbs.

As to the time of pruning, different authorities hold different views. Some contend that fall and winter when the trees are dormant is the best time. Others just as strongly contend that early spring just as the sap begins to flow is the best time. Personally, we are of the opinion that any nice day in winter is a good time to do the pruning and particularly at this season of the year when

other work is not demanding attention.

All dead limbs should of course be removed. Look over the tree, study it carefully and decide which of the large branches, if any, should be removed to let in the sunlight and air. After you have attended to the large limbs look over the tree for smaller details, cutting out superfluous small growth water sprouts and cut back the terminal growth one-third. Aim to keep the head low and bear in mind that a tree with a moderate top will invariably produce better fruit than one with a very large head, even though the latter is abundantly supplied with sunshine and air circulation.

#### DAMAGE BY MICE.

Every winter much damage is done to fruit trees by mice. This is especially noticeable after very hard winters and heavy snows. The damage is done under the snow, and is not usually detected until spring. A clean, tidy orchard is not likely to harbor many of these pests, since it is among tall grass, weeds, undergrowth and other refuse that they seek shelter. It is found to be an excellent practive to prevent damage to the bark of trees by mice to tramp the snow firmly about the base of each tree. This renders any grass or other material found there unavailable as shelter. Another plan is to pile earth six or eight inches high around the base of the trees. This should be removed in spring.

Still another method, which will kill the mice, is to wash the trunks of the trees with a solution of which paris green is mixed. Portland cement mixed to the consistency of common paint is found to be good for holding the poison. The mixture is applied to the trunk of the

tree with a stiff brush.

#### SPRAYING.

Before passing from the subject of fruit trees we would like to mention the necessity of thorough and systematic spraying if the best results are to be obtained. Fruit tree enemies, both insects and diseases, must be controlled, and spraying is at once the best and most economical way of doing this. It is no longer a mere experiment, it has become and is as important as pruning, cultivating or any other gardening operation.

There are certain essentials of spraying which should not be overlooked, and which we will briefly mention because space forbids us going into details. These are, spray thoroughly—careless, indifferent spraying is worse than useless, and is dead loss. Know why you are spraying. Sprays that control diseases are not effective against insects, hence there are sprays for each. Fortunately, these may be combined and applied at the same time. Spray in time; it is of very little use to spray after the damage is done. Have your material ready before hand, and take time by the forelock. Spray every year. Failure to observe this last essential has led many to doubt the usefulness of spraying at all.

Spraying is a long series of operations, so why not get as much available literature as possible and go thoroughly into the matter during the long winter evenings? It will

prove worth while; try it.

#### THE VEGETABLE GARDEN.

Advantage should be taken of all favorable occasions to proceed with the digging of the vegetable ground, especially if the soil is of a cloggy texture, so as to expose it to the weather. On no account should digging be proceeded with whilst the ground is frozen. To turn lumps of frozen soil into the ground only results in keeping it cold much later in the spring.

Manure may be wheeled or carted on the land that has not been dug during the spells of frosty weather.

The covering should be taken off and air given to cold frames during mild days. Celery should be aired whenever possible

ever possible.

Rhubarb, asparagus and sea kale may be taken into the forcing house as required; also chicory. Lettuce for transplanting later to hot beds may be sown now. For purposes of exhibition, leeks and onions may be sown under glass.

#### THE GRLENHOUSES.

Rambler roses intended for house and conservatory decoration in early spring, should be topdressed with good loam and bonemeal, and started into growth in a

temperature of forty to fifty degrees.

With the advent of longer days roses that have been blooming right along will soon show signs of renewed root action. When this occurs they may be topdressed with bonemeal, sheep manure or other approved fertilizer. A light application of soot will tone up the color wonderfully. Enough to blacken the surface of the soil is all that is required.

Gladiolus may be planted for spring blooming. Poinsettias should be stored under a dry bench. Specimen Lantanas that have had the water supply withheld may now be started into growth. Any that have become too dry and are backward about starting should be placed in a temperature of 65 degrees at night, and syringed freely during bright days.

Cinerarias have been taking stimulants in the form of liquid manure and light topdressing of commercial fertilizers for some time. This treatment should be continued once or twice a week until the flowers show color.

Hyacinths and other bulbs coming into blooms should be placed in a light position near the glass in order to get them as sturdy as possible. Take in another batch of bulbs to keep up a succession.

#### Estate Management and the College Graduate

By MORELL SMITH, New York

A private estate that is conducted for the pleasure and personal satisfaction of the owner is unique in its varied and exacting requirements in the matter of management. In what other vocation is there demanded a larger diversification of attainments? For the interests of an employer one must have knowledge as to building construction, landscape gardening, elemental engineering, horticulture and general farming. Furthermore, executive ability in dealing with men and honesty in handling considerable sums of money are required. Indeed an estate superintendent is called upon to draw contributions from nearly every division of human knowledge and experience in order to secure the repose and real enjoyment desired in a country seat.

From the nature and conditions of the work, it is very doubtful if many graduates of the four year courses in our colleges will be attracted to estate management as a life work. In these colleges there are courses designed to fit a student, let us say, to be an engineer or a dairyman, but I know of none which offers definite training for the position of estate superintendent. This work is both a business and a profession, and technical training would obviously be difficult to secure. Two or three per cent of the total number of estate managers would be a conservative estimate of the present ratio of college men in this line of work within a fifty mile radius of New York City.

The average age of a student upon graduation from a four year course is about 23 years. As preparation for estate management it would seem that an average of five years would be required in the way of practical working experience. A man of 28 or 30 who had this foundation training and experience would, as a rule, prefer to start in for himself rather than give the best years of his life to an employer.

Before a college man should consider this work there are other features which materially distinguish it from the common avenues of employment and which merit careful attention. The field is geographically a limited one. Country places that are large enough to warrant the expense of employing a technically trained manager can only be supported by men of large wealth who usually live within commutting distance of great centres of population. The fact that private estates are not run for gain makes cooperation among employees and between departments much more difficult than in commercial work where all the employees have a mutual dependence upon the financial success of the undertaking.

Finally, the duration and terms of employment are uncertain and varying. Again there is often more or less interference by the employer. A manager may often have to cater to his employer's whims when his own practical judgment would be adverse to certain methods of procedure. These combinations of circumstances, together with a practically unlimited financial backing, are apt to dwarf a manager's ambitious initiative and warp his perspective in such a way as to unfit him for future practical agriculture.

On the other hand, estate management presents an unique opportunity to a certain number of college men who, at the age of 25, will have grasped the training and experience that their average classmate does not secure before 28 or 30. If one can take a college course and early secure a large amount of varied practical experience and knowledge, this work will then form a helpful stepping

stone to his future independent ambitions. In such an instance a young man with these fundamental qualifications could well afford to spend a few years on an estate—preferably on one of the smaller places where he would get in close touch with the details of the work. Having such a field for his activities he could secure invaluable executive experience. In addition he could accumulate capital to start business in a small way along such lines as he might later elect. If a young man so qualified can win the confidence of a considerate employer and can develop the latent possibilities in the place this work becomes very interesting and profitible.

An owner of a country seat maintains such as a place of abode and relaxation after the cares of business. Consequently he desires relief from petty details, neatness in the general appearance of the place and high standard of products. An employer is looking for a superintendent who can secure these results economically, honestly and efficiently.

It would be difficult to master the practical details in the various and complex phases of work that appear in estate supervision. It is rather to be supposed that a college trained man in such a position would be a specialist along certain lines for which his training and experience fit him. It is not to be expected that any manwhether technically trained or not—should have a thorough practical experience in all departments in order to assume management of an estate. For example, a manager might have special training along lines of animal husbandry so as to personally direct the detailed feeding of dairy cows for record production. However, it would hardly be possible for the same man to be equally expert in the details of floriculture so as to win in a flower show. A manager can surround himself with practical men who are efficient in their particular field of carrying out the work along a general plan under his supervision. It is an essential requisite that such men evidence a spirit of cooperation not only with the manager but also between the different departments. If the manager will delegate the details and responsibility to these men at the heads of particularly specialized departments he can then hold them accountable for results.

There are certain phases in the management of country estates for which a technically trained man would seem especially fitted. The average estate which can afford to hire such a man should have a sufficient budget to be spent on the work which his supervision convers. An employer appreciates nothing so much as the satisfaction of knowing that his money is being wisely spent and that he is getting value received for his outlay. A cost system that shows total expenditures in various departments together with a systematized budget are business features that appeal to an employer. A terse monthly report showing how money has been spent; how labor has been employed; what has been done and what has been produced is likewise essential. It helps to keep the owner in close touch with the work and hence enlists his interest and cooperation.

A major portion of the work on a private place is of a routine nature and a careful study and systematization of this will result in general increased efficiency. The administration of an estate involves the application of a large number of new ideas in the practice and science of agriculture to obtain the results the present day employer requires. With the training a college man has had he should be progressive enough to adopt new ideas and yet

\* All rights of publication reserved

conservative enough to discriminate against fads and fancies.

Let us now summarize the essentials of country estate management: An employer desires personal comfort, relief from details and satisfactory results. To meet these demands and execute work economically and efficiently through systematic business methods, science and practical common sense. An executive so qualified and possessing honesty and personal integrity can command a salary commensurate with the service he renders.

"Paper end before the coverties of the National Association of Gassler etc. Homostroph Hall, Boston, Mass. December

#### CULTURAL NOTES ON THE GARDENIA.

BY W. R. FOWKIS, NEW YORK.

The beautiful fragrant pearly white blooms of this charming exotic plant, the Gardenia, truly accords it a place in the first rank of high class greenhouse plants; yet, how seldom do we see a healthy grown batch of plants in the private gardens of the rich.

One is accustomed usually to find, even on large places with the general run of plants in superb condition, the Gardenia frowned upon, because batch after batch has been tried with the usual resulting yellow sickly leaves and buds continually falling off, so that discouragement has caused many gardeners to dispel forever the idea of giving any more space to their cultivation.

These flowers present a charming appearance when properly grown and cared for as they deserve, and are worthy of the best attention any gardener can bestow on them. There is no possible reason whatever why they should not be given the prominence

they occupied a score or more years ago.

Their culture is simple if one or two important points are observed. To begin with, it is essential to get hold of good healthy vigorous stock of young cuttings, which can be inserted in the sand much the same way as roses are propagated. The time for this operation is in December in order to obtain good plants by June 1. Before placing in the sand give them all a dip in a good insecticide solution. You all have your particular kind to use. Water the sand twice a week and keep the bottom heat heady and continuous. In three or four weeks they will be rooted and require potting into 2½-inch pots. Place a crock in the bottom and then a rough piece of leaf soil to prevent clogging of the drainage. This is a very important matter throughout their period of growth, as on this very particular point of drainage the health of the plants depend.

The first compost should be half leaf soil, one-fourth sand, some charcoal dust, and the remainder good loam. Pot fairly firm as they are hard wooded plants.

At this stage of their growth the plants require a light place and sunny bench in a house which never goes below 70 degrees Fahrenheit at night. They must be watered when necessary with the chill taken off the water and syringed each morning, but never have them wet at night, and let the atmosphere of the house be constantly charged with moisture or the red spider will attack them.

Keep potted on until they are in 4-inch pots, and take the point out with the thumb and finger of the leading shoot in order to induce the plants to break.

Gardenias can be successfully grown either in the benches or in pots. I prefer the former, although if a few are grown in pots—6-inch can be used—and they are very serviceable for occasional house decoration. If grown in benches on a large scale it will

repay to replace the tile or wooden bottoms with wire netting one-half inch because more perfect drainage is assured and perfection will never be attained without it.

The compost should now be composed of two parts good fiberous loam, one part rotted cow manure, one part leaf soil, the flaky kind from the leaves of the oak or beech if possible—four inches is sufficient depth—and when the bench is filled a good sprinkling of fine charcoal can be mixed in.

The plants can bet set fifteen inches apart and the soil made firm around each plant and given a good watering from now on with a minimum temperature of 70 degrees Fahrenheit. They will grow rapidly and must be given careful attention as regards to ventilation, because a chill will retard any other effort put forth in their culture.

Damp the floors with manure and soot water twice a week when closing the house at night, and you will notice the advance the plants will make in a short time

The Gardenia requires a large amount of water during hot weather, also constant daily syringing, occasionally the plants will get too wet, or angle worms infest the soil preventing the surplus water being carried away, and to counteract this, having tried every known remedy, the one I now prefer is "Vermine." It is a highly concentrated compound and used as directed, one part to four hundred parts of water, it is cheap and can be safely applied once a week. It will rid benches or pots, no matter what they contain, of all worms or maggots so destructive to the roots of many valuable plants.

Plants set in June will produce flowers in October and disbudding must be resorted to obtain good-sized flowers. As before stated, they are seldom troubled with insects and the mealy bug is the most trouble-some one, but it can be kept at bay during the growing season by spraying regularly once a week with a solution of "Aphine," the best remedy I know.

When pots or benches are well filled with roots they need feeding. Use liquid cow manure once a week and an occasional top dressing of Clay's fertilizer in equal parts of fine loam. Always see that the plants are dried off when in bud before closing down the house.

The variety best suited for early winter blooms is the Cape Jasmine, or Gardenia Veitchii. Gardenia Florida produces larger flowers but does not commence to bloom until the spring.

#### THE 1916 BOSTON FLOWER SHOWS.

The Massachusetts Horticultural Society will hold an increased number of exhibitions in Horticultural Hall, Boston, Mass., during the year 1916. Throughout the summer two shows will be held each month. Four thousand dollars will be awarded in premiums at an exhibition in May, while in November next a very large show is being arranged for. In order that the flower show schedules can be prepared well in advance, the trustees of the society have secured the power to appropriate the necessary funds for prizes three years in advance.

#### Washington Atlee Burpee

In the passing of Washington Atlee Burpee from this sphere one of God's noblemen has been removed from among our midst. Horticulture has been deprived of a great leader, one whose counsel was always eagerly sought after. A friend of the humble as well as of those more fortunate in this life's good, Mr. Burpee has left a host behind to mourn their loss. The high esteem his friends held him in could not be more fittingly expressed than in the following tribute in an editorial appearing in the Philadelphia North American:

"Though he came to be known as a leader in his line of business, his finest achievement was the cultivation of a nature so thoughtful for others, whatever their place or portion, that everyone who came within his radiance was warmed by it and in some measure inspired to kindlier thinking and do-

"That, in a word, was one of his chief aims in life -to keep as many as crossed his path from the rough road of not enough."

W. Atlee Burpee was born 57 years ago at Sheffield, New Brunswick, coming to Philadelphia at an early age. He was educated in the Friends Central School and the University of Pennsylvania. In 1878 he founded the house of W. Atlee Burpee & Co., which was destined to become the largest seed house of its kind in the world, Mr. Burpee being one of the pioneers in the mail order seed business. His strict integrity and close application even to the smallest details of his business soon gained for him a confidence among his cus-

tomers, numbered in the thousands, which was never shaken. Mr. Burpee's close attention to business did not. however, prevent him from interesting himself in outside affairs. He was an active member of practically all the important horticultural organizations and prominent in the club life of his city.

If all the kind deeds of W. Atlee Burpee toward his fellowman had been recorded he would have been recognized as a great public benefactor, but he did not believe in "letting his left hand know what his right hand doeth."

W. F. Therkildson, who was associated in business with Mr. Burpee, relates an incident which occurred at the meeting of the directors of the Poor Richard Club, to pass resolutions on the death of their fellow member and there one recalled Mr. Burpee's Christmas treat to the poor children. He said, "Some years ago I was lunching on Christmas Eve with Atlee Burpee. He was in a great hurry to return to his office, for there it had been his custom, assisted by his two sons his wife and sister to hand out to the hundreds of poor children of this congested neighborhood, the Christmas boxes of candy or the bright new quarters that brightened the Christmas of these poor kiddies who knew and loved him ,too.

"I asked his permission to view this festival and when we stepped off the trolley car at the Burpee Buildings it was to be greeted by a perfect sea of red caps and dirty faces, but from all, as one, came the glad cry of 'Here he comes, here he comes,' and even the big policemen that

had been detailed to keep these hundreds of children in line, doffed their caps in true affection for this great,

kind man."

This good fellow spoke only too true, writes Mr. Therkildson, for while he talked I, too, had been thinking of the last merry Christmas when he made glad the hearts of this horde of youngsters, and as I write I cannot help but know that when at six forty-five on Friday night, November 26, W. Atlee Burpee was called to leave this earth, he surely heard from that land where poor and rich kiddies rank alike, that same glad cry, "Here he comes, here he comes."

"How fittingly this man's life closes, That like blown petals on the grass, In this sere time of Summer's Roses He, too, should pass!

Light be the churchyard loam above him, And sweet the Spring that he shall know There shall God's blossoms lean to love him. Who loved them so.

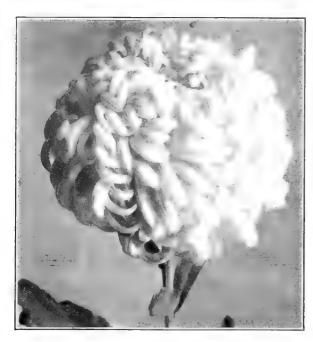

WASHINGTON ATLEE BURPEE.

The toregoing lines, writen of Mr. Burpee, are from the pen of Tom Daly in the Philadelphia Public-Ledger.

#### THE HERO.

He who can find real joy and pleasure In tilling the rough new ground, Or in wielding the hoe or the hammer While others are lying around; He who follows the tunnels of commerce Or digs the deep shaft of the mine, Or who plies the swift shuttle in weaving And never is known to repine; This man is the hero of heroes, The noblest and best of them all; He's the bone and sinew of nations. -Selected. But for him society'd fall.

# NOVELTIES OF 1916

ARTISTA.

ARTISTA A Smith novelty. The introducers believe is the largest exhibition variety they have ever raised, and doubt if it will be surpassed by any now grown, not excepting Wm. Turner, Odessa, etc. White with a slightly creamy tint in the depths.

WM. RIGBY. A Totty novelty. The yellow sport of Mrs. Gilbert Drabble, being an exact duplicate excepting in color. The shade is a beautiful bright canary yellow.

MORRIS KINNEY. A Totty novelty. A beautiful incurving white flower, on the lines of Wm. Turner, but, a week to ten days earlier in blooming.

OGONTZ.

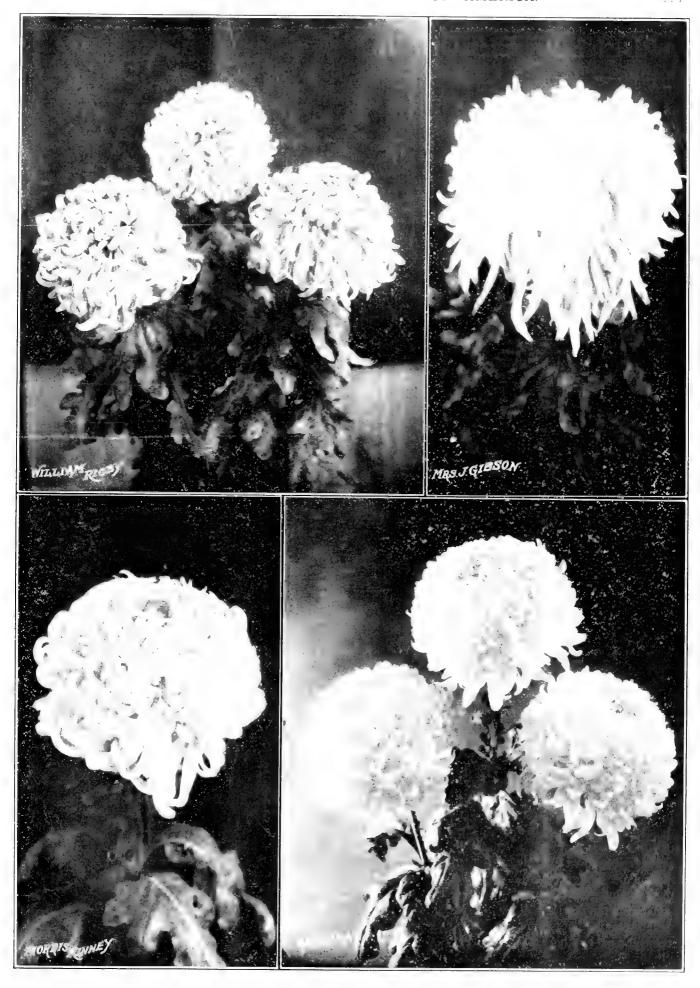

OGONTZ. A Smith novelty. A seedling from Nakota which it greatly resembles in foliage, and has the same whirling arrangement of petals, with size equal to its parent. Color, light primrose. Practically the same as Nakota except color, maturing first week of November.

AUTOCRAT. A Totty novelty. A variety of great promise. Snow white in color; dwarf in growth but robust. Can be flowered for Thanksgiving and Christmas.

MRS. J. G1BSON. A Totty novelty. Large, alike in stem, foliage and flower; light pink in color. Blooms have been exhibited ten and a half inches deep and ten inches across.

ALICE DAY. A TOTTY NOVELTY AN IDEAL EARLY FLOWERING VARIETY. PERFECTLY FORMED BLOOMS OF PURE WHITE COLOR; MEDIUM SIZED FOLIAGE.

Boston has long been known among horticulturists as "The Hub of Horticulture," but the visiting gardeners to that city attending the convention of the National Association of Gardeners last week have affixed the word hospitality and hereafter Boston will be known to them as "The Hub of Horticulture and Hospitality." For did not the horticultural interests of Boston and the local gardeners' and florists' club, and the city's officials entertain them as they never were entertained before. Banqueted on the evening of their convention day and shown Boston's Park System, the Arnold Arboretum and some of the prominent private estates in the vicinity of Boston on an automobile trip the following day made the gardeners' stay in that city a memorable one-one long to be remembered by those who enjoyed Boston's genial hospitality.

#### WHY WE ARE PROSPEROUS.

We read that prosperity reigns in different sections of the country. The West is prosperous because "more than a billion bushels of wheat is indicated and more than 1,500,000,000 bushels of oats, record yields both, and more than three billion bushels of corn, only a little below the average."

We read that the South is prosperous because "a relatively reduced crop of cotton is putting the South in funds." Thus we see that prosperity comes from small crops as well as from large, which only goes to prove that finance and financial writing possess intricacies that have no necessary connection with common sense.—Life.

#### Goodby, Old Year, Goodby!

(1) I.D YE.IR, the parting time has come, The time when we must say "Goodby" to you, and shake your hand, And speed you on your way. He'd like to see your stay prolonged, Your time is up, the limit reached, And therefore you must go.

You've been a very friendly year, Considering all things; You've journeyed with us, hand in hand, In all our wanderings. Through days of storm and days of calm You've always with us gone, .Ind oft at night you're with us watched For coming of the dawn.

With you we've seen a winter go And heard the robins sing; Till you we're couldy gazed upon The beauties of the spring. With you we've seen the summer come, In all its wealth of bloom, And with you we have wandered through The gardens of perfume.

With you we saw the autumn tint The leaves in colors bright; .Ind you were with us when the frost Spread wide its deadly blight. And when the winter came again It found you still our friend, Though weary, faint and tottering, And waiting for the end.

Twelve months ago we welcomed you, When you were young and fair, But now your once straight form is bowed, And whitened is your hair. The time has come for you to go, And we can only sigh And shake your hand, and sadly say, "Goodby, Old Year, goodby!"

---Theodore H. Boice.

OFFICIAL COMMUNICATIONS

Madison, N. J.

#### PROCEEDINGS OF THE ANNUAL CONVENTION BOSTON. MASS., DECEMBER 9, 10, 1915.

The innual convention of the National Association of Gardevers, was held in Horticultural Hall, Boston, on Thursday, December 9. The hall was well filled with an enthusiastic audience. when John K. M. L. Larquhar, president of the Massachusetts Horticultural Society and acting as temporary chairman of the convertion, greeted the assemblage. On Thursday evening the members of the National Association of Gardeners became the guests of the Gardeners' and Florists' (lub of Boston, and the horticultural interests of that city at a banquet in Horticultural

#### OFFICERS ELECTED FOR 1916

WM. N. CRAIG......Brookline, Mass., President. THEODORE WIRTH ...... Minneapolis, Minn., Vice-President. MARTIN C. EBEL .. Madison, N. J., Secretary. JAMES STUART Mamaroneck, N. J., Treasurer.

On Finday as the guests of the park officials of Boston, the visitors were entertained with an automobile trip through the park system, the Arnold arboretum and an inspection of the prominent private estates in the vicinity in Boston, and at luncheon at the Dedham uniseries of R & J. Farquhar & Co.

#### Welcoming the Members to Boston.

In welcoming the visitors to Boston, Mr Farquhar said: Gentlemen and fellow members of the National Association of Gardeners, I want to congratulate you on your good judgment in selecting Boston as the place of your National Convention.

As president of the Massachusetts Horticultural Society, it gives me great pleasure to welcome you under the roofs of our buildings here to a semble for your convention.

This society, perhaps the oldest in the country, which has done more than any organization in the country for the furtherauce and promotion of horticultural work, is glad to have this meeting here. Our society realizes that if horticulture is to be promoted it must be promoted through your instrumentality.

The gardeners are the men that point the way in things hor-You men, representing the foremost element in your eraft, the advance guard of the art of horticulture, have come here to hold your convention, to spread your ideas, to give your knowledge to this, the length and the breadth of our country, not merely for any mercenary motives, but you are interested in the development, in the promotion, in the enlargement of horticultural influence and in instilling the love of the art of horticulture among all of your fellow citizens.

That is why you have come here, gentlemen, and that is why this society welcomes you to this city, which has done so much in the past for northeulture and is doing no less today than it

ever did before,

Is there + y work anywhere in the world to compare with our Arnold arboretum, with our park system, perhaps the finest in the country, but there are two gentlemen here who can tell you more of that than I can, and in welcoming you I am sure that his Honor. Mayor Curley, will tell you something of what Boston does for beautifying and for adding utility to the spaces that we have for the citizens of Boston to breathe in. I take great pleasure in introducing his Honor, Mayor Curley, who has done much for horticulture (Applause.)
Mayor (urley, whose address appears in full in another column.

spoke eloquently or horticulture and its future in Boston.

Mr. Farquhar next introduced Captain John H. Dillon, Chair

man of the Park Commission, who replied in part:

Mr. Chairman, Mr. Mayor and Fellow Gardeners; that is the name that I like best to call you because, notwithstanding his Honor the Mayor raised me to the high dignity of Chairman of the Park and Recreation Department of our city, I was, when he sought me out among the many men in this city, a humble working gardener. Therefore, it is most pleasing to me to address you by the name of fellow gardeners.

Boston is proud of its park system; its park system was made by the gardener. I realize fully the opportunities that the gardeners of today have over the gardeners of the past. We today are simply students of what has passed away. Realizing, in the early history of our profession, ancient Rome built its magnificent gardens opied from the ancient Persians, and from the ancient Persians the ancient Romans, and the ancient Greek, it was brought to England, brought to Italy, brought to France, and brought to Spain, and finally brought here to this country. We have been imitators in the past of all those various styles of gardening, one trying to vie with the other, the English gardening with its solid style, the French style with its intricate pieces, the Italian style with its monuments and its gardens, and all combined here in Boston. We have tried to take the best parts of all and weave them together, and by taking the best parts of the English style, the Italian style, the French style, and the old Persian style, and Weaving them all together, and taking their better parts. I realize, and as every gardener her must realize, that we are working out a distinct problem in gardening today.

Mr. Farquhar next presented the president of the National Association of Gardeners, Mr. Everiti

#### President's Response to Address of Welcome.

President Everitt: Mr. Chairman, and Honorable Mr. Mayor, I thank you on behalf of the members of the National Association of Gardeners for your very cordial welcome. I might say that we gardeners expected it, as we know that Boston, its officials and its people contain a warm heart for everything and everyone that is associated with horticulture.

I am sorry that I cannot respond to you in the eloquent language in which you addressed us, but you may rest assured that your presence before us today and your cordial welcome is much

appreciated by each and every one of us.

Fellow members and friends, I welcome you to our convention, which, I am happy to say, everything forecasts that it will be a notable one, and that we are about to add another chapter to the history of our association, full of encouragement and bright prospects for the future outlook of our association.

Our profession and our National Association in this country are still in their infancy, so far as their mission is concerned on this side of the Atlantic. Our association is attempting much for the benefit of our profession and it will be successful in what it undertakes if we can count on the individual efforts of our members to help carry out what the association strives for.

At our summer meeting at San Francisco in August last, which unfortunately, owing to circumstances beyond my control, I was not able to attend, there were many practical suggestions advanced for the development of our organization, and if acted upon they would soon make the National Association of Gardeners a nation-wide factor in the cause of ornamental horticulture and all that that implies, and so, I wish to recommend for your consideration the carrying out of some of the suggestions referred to.

Our local committee has proven most faithful in the work entrusted to it, and presents to us a most interesting programme for today's session. I trust that what you hear and learn today will prove helpful to you and also that there will be a general participation in the discussions which should arise over the subjects of the very able papers which we are to listen to today, subjects which are of interest to all of us.

As we have much business before us I will not take up much more of your time, but will call on the secretary for the minutes

of the last convention.

The regular order of business followed.

The secretary read the minutes of the 1914 convention, hell in Philadelphia, Pa.

The secretary read his annual report.

#### SECRETARY'S REPORT.

The events of the past year within the National Association of Gardeners have been such as to attract general attention to it from coast to coast, among those engaged in the profession of gardening. The summer meeting held in San Francisco, while not a largely attended one, was successful in developing some suggestions among the members present which are entitled to serious thought on the part of the association with a view of adopting some of

The various committees have been active and have made considerable progress. Their efforts are beginning to be better understood and there is no doubt that they will obtain more individual and collective support in the future than they have in the past in the work that they are endeavoring to further.

A good indication, showing that the association is drawing interest to itself is the number of unsolicited applications that are being received for membership from all parts of the country from men engaged in the gardening profession. A concentrated effort on the part of the members should result in increasing the membership of the association twofold in a comparatively short time. It can be done if the members will bend to it.

On March 19 an executive meeting of the trustees and directors was held in the Hotel Murray Hill, New York City. Wm. Kleinheinz, as chairman of the Committee on Private Growers Exhibits for the Fourth National Flower Show to be held in Philadelphia in March, 1916, under the auspices of the Society of American Florists, extended an invitation to the members of the N. A. G. to participate in this show. The invitation was accepted with the assurance that the N. A. G. would cooperate in every way possible with the National Show next year.

A committee was appointed to devise a suitable design for the association's medal, and it was voted to offer a silver medal at the Chrysanthemum Show of the Chrysanthemum Society of America to be held in Cleveland, and at the special show to be held in San

Francisco in the fall of 1915.

An invitation was received from the American Association of Park Superintendents to have the members of the N. A. G. join the park superintendents on the trip to California in August to attend the summer meeting.

An executive meeting of the trustees and directors was held at the Hotel Martinique, New York City, on Wednesday, July 14. The committee reports all showed good progress. It was voted to send an official communication to delinquent members that unless their indebtedness to the association was paid by September 6 that they would be dropped in pursuance with the by-laws.

The secretary was instructed to draw up a resolution to amend the by-laws to present at the annual convention, to the effect that members two years in arrears for dues, shall be suspended instead

of three years as the by-laws now provide.

The secretary was instructed to acknowledge receipt of the invitation of the American Association of Park Superintendents received at the previous meeting inviting the members of the N. A. G. to join them on their trip to the Pacific Coast and to extend the tlanks of the Executive Committee for the same.

It was decided to hold the annual convention in Boston during

the first week of December.

A meeting of the trustees and directors was held in the Copley Square Hotel, Boston, on Thursday, December 9, to dispose of what business might come before it prior to the holding of the convention.

M. C. EBEL, Secretary.

JAMES STUART, Treasurer.

Boston, Mass., December 9, 1915.

We have completed our audit of the accounts of your treasurer up to December 8, 1915, and are pleased to report that we find the statements as rendered above to be correct.

JAMES MacMACHAN, ARTHUR SMITH, JOHN F. HUSS,

Auditing Committee.

James Stewart, treasurer, after reading his report, said: In addition to that I have a little memorandum which will be of interest to the members, I think. In 1911 the association was somewhat in debt. In 1912 we paid off that debt, and had \$192.97 in the treasury. In 1913 at the annual meeting the amount in the treasurer's hands was \$381.91, and in 1914 we had \$743 in the bank, and today we have \$1,289. (Applause.)

Reports of standing committees was the next order of business.

#### REPORT OF ESSAY COMMITTEE.

The essay contest, for President Everitt's gold prize of \$100, has occupied most of the time of the Committee on Essays and Horticultural Instruction during the year. The contest was arranged in four classes, to which all gardeners engaged in private growing were eligible. It was announced that the contest would close on October 1, and that the decision of the judges would be announced at the convention in December. When the closing date arrived, and it was found that the number of the essays submitted was so small with a number of them not of the standard to be accepted in competition, your committee decided to reopen the contest and continue it until February 1, the successful competitors to be announced in March at the National Flower Show in Philadelphia. In all, essays were received up to October 1.

On horticultural instruction your committee devoted some time early in the year, but on careful investigation found that it would be impracticable to attempt to provide any study courses for members, which would not be entirely under the control of the association. To do this would incur a considerable expense on the association, in the employment of instruction and maintenance of an instructional department, and this in the opinion of your committee, the association is not yet in a sufficiently strong financial position to undertake.

WM. H. WAITE, Chairman, Committee on Essays and Horticultural Instruction.

#### REPORT OF NATIONAL CO-OPERATIVE COMMITTEE.

Co-operation between the National Association of Gardeners and a number of local societies has been brought about, and twenty-one local societies have appointed local co-operative committees to work in conjunction with the National Co-operative Committee which represents the National Association of Gardeners. The suggestion has been made that the association issue an occasional bulletin to its members, but this want seems to be amply supplied by the official organ. That more organization matter does not appear in its columns is due to the committees and members themselves in not supplying the material.

At the solicitation of the Nassau County (N. Y.) Horticultural Society, a resolution from that society was submitted by the National Co-operative Committee to the different local clubs and societies throughout the country, to the effect that a member of a local horticultural society removing to another locality eligible to full membership in the horticultural society in the locality to which he has gone, if he is in good standing, without the payment of dues until the end of the fiscal year.

This resolution has so far been adopted by sixteen societies. The committee is anxious to hear from the different local cooperative committees on any subjects or matter that may be of interest to disseminate among the local societies which have joined in the co-operative movement. The national committee stands in the position of a central source, through which the different local societies desiring to participate should be kept in frequent touch with one another; but this can only be made possible through all concerned taking an active interest in the movement.

> J. W. EVERITT, Chairman. National Co-operative Committee

#### REPORT OF COMMITTEE ON MERITORIOUS EXHIBITS.

As chairman of the Committee on Meritorious Exhibits I submit the following report:

At the meeting of the trustees and directors, held in New York City in July, it was decided to offer the association's silver medal for competition at the chrysanthemum show and supplementary meeting of the Chrysanthemum Society of America, at San Francisco, Cal., for the best six chrysanthemum flowers, six varieties, shown by a member of the National Association of Gardeners.

It was also decided to offer the association's silver medal in competition at the annual convention and show of the Chrysanthemum Society of America in conjunction with the Flower Show at Cleveland, Ohio, for the best six chrysanthemum flowers, six varieties, at both shows and good competition was aroused for the medal.

Percy Ellings, of Menlo Park, Cal., won the medal at the San Francisco show, but the name of the winner at the Cleveland show is as yet unknown to your committee.

By offering the association's medal at various flower shows the association is brought to the attention of the gardeners and of the public and others, and offers an excellent means of publicity. I therefore would recommend that we offer a silver medal at the different shows held by societies during the year 1916 who may desire to accept the same for the most meritorious exhibit shown by a member of the National Association of Gardeners.

WM. KLEINHEINZ, Chairman. Committee Meritorious Exhibits.

#### REPORT OF THE COMMITTEE ON BIRD PRESERVATION.

The committee on bird preservation and propagation was appointed late in February of this year, and its preliminary program of work was outlined in a report published in the GARDENERS Chronicle, May issue.

The chairman of this committee at once secured the co-operation and support of the United States Biological Survey, the National Association of Audubon Societies and a number of other active organizations whose support would be of value. The most courteous and sympathetic responses were received from these sources, and we believe that their co-operation will be of great future value.

In June a similar committee was appointed by the American Association of Park Superintendents to co-operate with our committee. Your chairman immediately communicated with the members of this committee, and received a most hearty response. As a result of this, a joint meeting was called, and held in San Francisco, Cal., on August 19. A report of this meeting was published in the Gardeners' Chronicle, September issue. This meeting was attended by seven of the ten members, and was a very enthusiastic one.

 $\hat{A}_{S}$  the work of co-operation between the two committees has as yet not progressed far enough to report specific results, we are inclined to believe that it would be desirable to have the committee reappointed.

We are particularly indebted to our Secretary, Mr. Martin C. Ebel, for his valuable suggestions and for the space given us in the Gardeners' Chronicle for articles pertaining to this subject. We wish to state emphatically that we need the support, help

and suggestions of the individual members if we expect to accomplish anything worth while; without this support very little progress in the work of your committee is possible.

L. P. JENSEN, Chairman.

Committee on Bird Protection and Propagation.

#### SERVICE BUREAU REPORT.

If the inquiries to the Service Bureau during the past year had been in proportion to the number of applications received for positions, we might feel justified in reporting that the Bureau is performing a noble work,

The purpose of the Service Bureau is becoming well known among gardeners, but its existence is not yet well established among estate owners and others requiring the services of men in the profession. This matter has received the careful attention of the directors during the last year, and the matter of exploiting the Service Bureau on a more extensive scale to acquaint estate owners and others of its facilities was thoroughly discussed. It was suggested that an advertising campaign be begun at once to accomplish the point in view, but after deliberate consideration it was deemed advisable to postpone such action until the organization is in a stronger liminical position as it was shown that a considerable expenditure would be required to properly carry out the plan to properly advertise the service,

One of the prominent Eastern seed firms is advertising the Service Eureau of the National Association of Gardeners in its 1916 catalogue, as a responsible source through which to secure efficient gardeners in their various capacities, and no doubt in another year others will follow this example, as many firms prefer to be absolved from the responsibility of filling positions.

While the bureau was successful in placing some gardeners in positions during the last twelve months, there were, however, many who applied who could not be aided. In instances where gardeners applied for an opportunity to better themselves but were holding positions, advice was given, that under the existing general unsettled business conditions, they cling to the position they held, and in many cases this advice was gratefully accepted.

Inquiries from people seeking capable gardeners at garden laborers' wages, of which a number were received, were replied to, to the effect that the bureau could not serve them, unless they could offer a salary consistent with the services expected,

The Service Bureau solicits the co-operation of members who may hear of opportunities presenting themselves which may aid a fellow-member, by advising the bureau of such opportunities.

M.C. EBEL. For the Service Bureau.

The next business in order was the presentation of resolutions, the following amendment to the constitution and by laws being offered:

Article III, Section 1. The annual dues for active and associate members shall be two dollars a year, due and payable on January first of each year. Members in arrears of dues for more than one year shall be suspended and cannot be reinstated to good standing in the association until their indebtedness to it is paid."

A motion that the by-laws be amended as read by the secretary was unanimously carried.

The secretary read a communication from Mr. Wallace R. Pierson, secretary of the A. M. Pierson Company, Inc., Cromwell, Conn., inviting the members of the association to visit Cromwell.

The invitation was accepted with a vote of thanks.

A communication from A. H. Hews & Company, Inc., was read inviting the members to visit their plant, which was accepted with a vote of thanks.

Mr. James MacMacren: Mr. Chairman and gentlemen. I have a resolution to put before this meeting. It is not anything new, because we all know about it. It is about that remarkable chrysanthemum that was exhibited this fall by Mr. Lewisohn. That chrysanthemum has had great notoriety and publicity; it has had more than we can comprehend. That chrysanthemum is now in the moving pictures, and it has been read about and discussed in Japan, the home of the Japanese chrysanthemum.

In presenting this resolution, I think I ought to say that it is a great thing for any lady or gentleman to take such an interest to advance horticulture as they have done and put it before the public. In Cleveland, Ohio quite a small State in the way of horticulture they came forward and put up the money, I understand, to the amount of \$2,000, to bring that plant before the

I think that horticulture is advancing, when you think of a chrysanthemum plant going to Cleveland and a greenhouse being built on a railroad car, and when they went into the city the police force was brought up to keep the crowds back, and the finest band in Cleveland was brought forward, and with the chrysanthemum on a car, there was horticulture marching along. I think we are making proper strides.

Gentlemen, I want to ask the association to pass a resolution-

to ask the Chair to appoint a committee to commend Mr. Lewissohn, the superintendent of his beautiful gardens, on the integrity and ability he has shown in the promotion of that chrysanthemum.

The resolution was seconded, and was unanimously agreed to. Secretary Ebel: Mr. Chairman, under new business I would like to bring up a matter somewhat similar to Mr. MacMacren's.

year one of the most prominent of amateur gardeners, Mrs. Francis King, brought out a book entitled "The Well Considered Garden." I do not know whether many of you gentlemen have read that book, but a chapter of the book was published in The Gardener's Chronicle. Mrs. King in her book took up the question of the gardener quite differently than it has been handled in the past by those who employ gardeners. Mrs. King in this chapter shows the estate owners and others that they do not appreciate the value of the gardeners' services. Mrs. Francis King is well known throughout the land as a great amateur gardener, and I would like to submit for your consideration whether or not it would not be a nice thing to do to pass a resolution in appreciation of what Mrs. King has done in the interest of the gardener.

Mr. Duncan Finlayson: I wish to say that I read that article, and I appreciated it very much. Mrs. Francis King said the right thing in the right place, and I think we ought to recognize it. I am glad that this matter is brought up here. It is one of the best articles that I ever read about the gardener.

A motion to appoint a committee of three to draw up a resolution to forward to Mrs. King in appreciation of the work done

by her in her book was unanimously carried. President Everitt appointed Mr. Craig, Mr. Finlayson and Mr.

Mr. Arthur Smith: I think what I shall present will come under the head of new business. In fact, it is not very new, because it refers to a matter which has too long been delayed. I am sure that every member of the National Association of Gardeners appreciates to the fullest extent the work which Mr. Ebel has done for us, and we must realize our exceptionally good fortune in having a man of Mr. Ebel's position to come forward and act as our secretary. But up to now I believe that this appreciation has not been expressed in such a manuer as to have it spread upon the records of our association. Therefore, to that end I think we should accord to Mr. Ebel a formal vote of thanks.

Mr. Ebel has done for our profession what no one of us could have done or begin to do for ourselves. In saying this, I do not refer so much to the work that is purely secretarial or office work; that is a comparatively unimportant and small matter. Where we have scored is in the work which Mr. Ebel has done for us outside the office. Those of us who remember the useless nondescript affair called "The Association of Gardeners," which existed previous to this organization and Mr. Ebel taking over the secretaryship, will realize what a tremendous difference there is between the position which our association occupies today compared with what it was then. The position which our association occupies today is second to none in the horticultural world, although it is nothing to what it will be if we all do our duty.

The great growing strength of our association has been proved by the fact that it has had to meet opposition, and the energy and tact with which Mr. Ebel has met the opposition and the other adverse influences has caused our association to emerge

from them stronger than before.

Mr. Ebel is not only giving us a large amount of his time in a thousand ways, attending numerous meetings and conventions at which he must spend his money, but he must also have had to spend on our behalf a very considerable sum in hard cash in traveling expenses alone. It appears to me that the time has arrived when we should consider it derogatory to the position which our association occupies, and therefore derogatory to ourselves as individuals, to any longer permit Mr. Ebel to be out of pocket in this way. And I would like to move that a rising vote of thanks be offered to Mr. Ebel for his kindness in acting as our secretary, and that in the future the secretary be paid out of the funds of the association for all incidental expenses incurred by him in our behalf.

Secretary Ebel: Gentlemen, the matter of personal expense incurred by me in the matter of the business of the National Association of Gardeners I have always borne with pleasure. It has not always been direct expense, because at different places that I was in the interest of the association I would have been anyway. At the last meeting of the Boston Club I made a special trip to Boston and return, solely for the National Association of Gardeners' convention, and I believed that the association in that instance should pay my mileage, and as there is no modesty about me, I rendered a bill for it and it has been paid.

I do not feel that a vote of this kind should be passed. time that I think the association owes me anything, I shall render my bill for it, which is only right, but in regard to any other expense that I have in traveling around and in going to the shows I would prefer to have the matter rest as it has in the past.

I will say, however, that I would like to see the time comewhen the association will be so strong that it can afford to puta man in the position of secretary and pay him an annual salary to devote his entire time to it. There is enough work to keep to devote his entire time to it. There is enough work to keep him busy, and, if loyal, he won't have short hours, either. The proper conducting of the Service Bureau alone will take a great deal of a man's time. When that time arrives I want to see a gardener placed in the position and a proper salary paid to him. I have had much pleasure out of the position besides the labor, and I thank Mr. Smith just the same for his recommendation.

President Everitt: Gentlemen, the next business before us is the nomination and election of officers. The tellers will be Messrs.

Miller, Cruikshank and Collins.

President Everitt: We will receive nominations for president. Mr. Huss: 1 nominate John W. Everitt for the office of president.

President Everitt: Mr. Huss, I think I have already stated that I would not stand to be a candidate a second year. Moreover, I do not think that the presidency should be held more than one year by one individual. It is a national association, and I think it should be shifted from one State to another every year. Therefore, I must decline with thanks.

Mr. Newell: I nominate Mr. W. N. Craig for the office of

president.

man ever lived.

Mr. Collins: I move that the nomination for president be closed. (The motion was seconded and unanimously agreed to.) President Everitt: The next will be nominations for vice-

president.

Mr. William Downs: Fellow-members of the National Gardeners' Association, you have nominated a very estimable gentlemen for president, and it behooves you now to get a pretty good man as a running mate for him. The name that I am going to present to you I know you will all accept. There is no question about the man. He said at one time, Mr. President, "I was born a gardener, and I shall die a gardener." Although he is not holding a position today as a gardener, he is a gardener at heart. I have known him for several years, and every time I meet him I like him better. He was one of the few members of the Society of American Florists who took the trouble to be present at your meeting at Boston at the time of the convention. At that time the members were few and far between, as I remember, but he was one of the few who took his coat off and worked at that meeting. He gave us more encouragement than any other man. The National Association of Gardeners will not honor that man by nominating him to this office, but they will honor themselves. The man whom I wish to put in nomination for the office of vicepresident is Mr. Theodore N. Wirth of Minneapolis. No better

Mr. Huss: I move that the nominations for vice-president close. (The motion was seconded and unanimously agreed to.)

President Everitt: The next will be nominations for secretary. Mr. Downs: Mr. President. I don't think we ought to change secretaries. I am against that policy. We see that policy followed around us today, but I say it is a mistake, especially as we have such a good man. I ought not to be taking so much time on the floor, but I cannot help it. You have a good secretary. He has proved his worth today, and I take great pleasure in nominating Martin C. Ebel as secretary of our association.

Mr. Kennedy: Mr. Chairman, I would like to say in regard to seconding the motion of Mr. Ebel as secretary, that the gentleman who addressed the convention in regard to Mr. Ebel's expense account and salary was perfectly correct. The time has come, gentlemen, when you will have to have a secretary that you will have to pay. Mr. Ebel is the one man in the world today that has done more for the National Association of Gardeners than any other man, barring none. Mr. Ebel is not a gardener by profession, as you all know, and he has put his shoulder to wheel, and he has worked and helped as no other man has helped and worked, as I have seen, and it is my pleasure, I assure you, gentlemen, as a member of the organization, to get up and second the nomination.

A Member: I move that the nominations for secretary be closed. The motion was seconded and ununimously agreed to.)

President Everitt: We will now receive nominations for

Mr. Kleinheinz: I nominate Mr. James Stewart for the office of treasurer.

Mr. Kennedy: I move that the nominations for treasurer be closed.

(The motion was seconded and unanimously agreed to.)

Mr. Kennedy: Mr. Chairman, as there is no competition for the offices to which we have just nominated candidates, I move that the secretary be instructed to cast one ballot for the gentlementhat we have nominated for the different offices in the association.

(The motion was seconded and unanimously agreed to.) Secretary Ebel: I have cast one ballot for Mr. W. N. Craig as president, Theodore N. Wirth as vice-president, M. C. Ebel assecretary and James Stewart as treasurer.

President Everitt: Gentlemen, one ballot being cast by the secretary for those gentlemen, they are duly elected. (Applause.)

Mr. Craig: I nominate Messrs. Peter Duff, William Duckmann

and William Turner of New Jersey, and William Kleinhemz of Pennsylvania and J. F. Huss of Connecticut to the other of trustees.

A Member: I second the nomination.

Mr. Kennedy: I move that the secretary be instructed to east one ballot for the five gentlemen named as trustees.

(The motion was seconded and carried.)

President Everitt next appointed as a committee to pass on the exhibits, Messrs. Kleinheinz, Huss and Popp.

President Everitt: Gentlemen, the next business is the reading

of the essays.

Secretary Ebel: Mr. President, we have a number of essays, excellent papers here. The papers are before us, but the authors of them have not appeared. So I wish you would call for volumteers to read these papers.

President Everitt: Will you kindly oblige us by reading the first paper, Mr. Craig. Centlemen, will you kindly give your

attention to Mr. Craig?

Paper entitled "Is Gardening a Profession?" submitted by Mr. W. W. Ohlweiler, general manager, Missouri Botanical Gardens read by Mr. Craig, and is published in full in another column.

President Everitt: Gentlemen, each member is allowed five

minutes to discuss this essay.

Mr. Robert Cameron: There has been one point that has not been touched on in that paper, I think, and that is, what is the name "Gardener"? A great many gardeners, it seems to me are ashamed of that name. When they get two or three men working under them their name is changed to "superintendent." think if the name isn't good enough for them they ought not to belong to this society. (Applause.)

Mr. Kennedy: Mr. Chairman, I would like to ask Mr. Cameron

if a man can be a superintendent and a gardener, too?

Mr. Cameron: Yes, he can.

Mr. Kennedy: Why change the name?

Mr. Cameron: The first name is good enough.

Mr. Finlayson: Mr. President, in looking over an old Webster's dictionary I happened to come across the name "gardener," and the definition it gave there was "The first gentleman on a gentleman's estate."

Mr. Downs: I don't think we need to quarrel so much about the name as we do about the man. The gardener of today has something else to do besides gardening, Mr. Cameron. I don't something else to do besides gardening, and camerons see why any man should be ashamed of the name "gardener," but we have to do other work and superintend other work. name is "gardener," and always will be, but he has to know something beyond the ordinary garden work in the average place today, and that is where the superintendent comes in, and you must give him some name. The word "superintendent" is nothing delogatory to a gardener. It simply means that he has the overlooking of the other work, and there is no reason why we should be sore about being called "superintendent."

President Everitt: I do not think the gardener calls himself a superintendent from choice very often. I think he is christened that way, and he has to take it. His employer generally calls him a superintendent. It is not what he calls himself, but

that is what he has been christened.

Secretary Ebel: Mr Chairman, in my visits among some of the estates I find that they have superintendents who are gardeners and that the superintendent has a head gardener and a foreman and assistants under him. If the superintendent is to call himself the gardener, what is the head gardener going to be called? It all depends upon the size of the estate, it seems to me, as to

the titles employed.

Mr Vernon T. Sherwood: At one time the head and | o | b establishment called me and said, "Sherwood, I want you to call yourself 'manager,' which is neither superintendent or gardener. To please her I called myself "manager," and to please myself I called myself "head gardener," and to many of my triends I give them my card which reads "gardener," but to her and her friends and business associates I call myself "manager." But the part that appealed to me most was the fact that she handed me the key to the wine cellar. She said, "Sherwood, I also want you to take charge of the wine cellar - I said, "Miss Kirby, I have been waiting four years for that key."

A rising vote of thanks was extended to Mr. Ohlweiler for the

very instructive paper he submitted to the convention.

President Everitt: Mr. Ebel will kindly read the next essay The secretary read paper entitled "The Management of Country Estates: From the Viewpoint of the College Graduate," by Morell Smith, Superintendent of Kiluna Farm, the estate of Ralph Pulitzer, published in another column.

A rising vote of thanks was extended to Mr. Smith for his

very able paper.

Mr. Kennedy: Mr. Chairman, if you will excuse me a minute, I would like to invite everybody here present through the courte-y

of the Gardeners' and Florists' Club of Boston and the horticultural interests of Boston to dine with us tonight in the basement of this hall. The supper will be served at 6 o'clock, and everybody here is welcome to go downstairs and have dinner.

Secretary Ebel: Judging from present indications I think that we can complete our business meeting by a quarter after 6.

Mr. Kennedy: Before I sit down I would like to say that the Committee on Arrangements has arranged an automobile trip through the park system of Boston and some private estates for the visiting members tomorrow, which will leave promptly the Copley Square Hotel at half-past 9.

President Everitt: Kindly give your attention, gentlemen, to Mr. Craig. He is going to read a paper entitled "The Young Gardener's Opportunity in This Country," by Henry Gibson of

New York.

The paper was read by Mr. Craig.

(Mr. Gibson's paper will be published in the January number of the CHRONICIL.

Mr. George N. Smith: Mr. President, that to my mind was a remarkable paper. I agree with every word of it. As between the practical man, the man who has worked up from the potting bench and so-called technical man or college graduate, give me the

practical man every time.

Mr. Cameron: Mr. President, I wish to say that I have probably listened to hundreds of papers in this building, and it is my pleasure to say that the paper which has just been read to this association is probably the best paper I ever heard read. (Applanse.) Mr. Gibson's paper is full of valuable things. We could discuss it for a week, but we haven't the time. The subject he has touched on here we have touched on over and over again. The question of the college graduate has been threshed out at our meetings dozens of times. He has written an excellent paper, and every sentence contains so much in it that we could discuss it for hours, and I move that a rising vote of thanks be given to Vir. Gilson for his able paper

The motion was seconded and carried.) President Everitt: We have another essay.

Secretary Ebel: This paper is entitled "Is Co-operation Betweep Garden Clubs and Gardeners' Societies Desirable?" by William Gray, secretary, Newport Horticultural Society.

(Paper read by the secretary.)

Arthur Smith: It seems to me that co-operation is a thing that we cannot have too much of between all the members of the horticultural world. If the garden clubs can co-operate and will come into touch with the professional side, then each will be benefited by it.

(The motion to extend a vote of thanks to Mr. Gray was sec-

onded and regularly carried.)

President Everitt: The next is the report of the Exhibition Committee.

(The report of the Exhibition Committee was read by Mr. William Kleinheinz, as follows: )

#### REPORT OF EXHIBITION COMMITTEE

REPORT OF EXHIBITION COMMITTEE

Continual, exhibited by W. Downs, Classimit H.II. Mass. Special mention for two W. Downs, Classimit H.II. Mass. Special mention for two specimens. Begonias Lorain, exhibited by Mr. D. Finlayson, Brookline, Mass. Certificate of Culture for a fine display of Calanthas, exhibited by Mr. D. Finlayson, Brookline, Mass. Acts of thanks to W. W. Edgin Company, Mr. Basch, Manager, for display of palms.

Certificate of Culture for a well grown vase of Carnation Alice Centle, exhibited by A. Roper, Tawle sbury.

Certificate of Merit for a vase of Carnation Commonwealth, exhibited by A. Roper, Tewlessimy.

Honorable Mention for a vase of Carnation Morning Glow, exhibited by Edward Winkler, Wask field, Mass.

Certificate of Merit for a vase of Carnation, Miss Teo, exhibited by Edward Winkler, Wask field, Mass.

Certificate of Merit for a vase of Carnation, Grace, exhibited by A. Roper, Tewkeshury, Mass.

Certificate of Merit for a vase of Seedling Carnation, No. 360, exhibited by A. Roper, Tewkeshury.

A certificate of Merit for a vase of Roses, "Mrs. Bayard Thayer," exhibited by Mr. Montgomery, Washin Greenhouses.

Certificate of Merit for three plants of a new type of winter thowering Beromas, consisting of Winter Cheer, Aureana and optima, "exhibited by Mr. Montgomery, Washin Greenhouses.

Certificate of Merit for three plants of a new type of winter Cheer, Curcaina and optima, "exhibited by Mr. Montgomery, Washing O. Winter Cheer, Aureana and optima," exhibited by William C. Rust, Mr. Weld, Gardener, Brookline, Mass.

Certificate of Merit for vase of pulk shapdragon, "Weld Pink," exhibited by William C. Rust, Mr. Weld, Gardener, Brookline, Mass.

Special Mention for a fine collection of Lilium bulbs, exhibited by John Scheepers & Company, Inc., New York, for display of Neophroleps and Spircas.

Vote of Thanks to John Scheepers & Company, Inc., New York, for display of Neophroleps and Spircas.

Vote of Thanks to John Scheepers & Company, Cambridge, Mass. To a display of Pottery.

WM KLEINHEINZ. JOHN T. HUSS, P. W. POPP

President Everitt: I will appoint on the Lewisolm resolution committee James MacMacren, William Downs, William Kleinheinz, Robert Comeron and William N. Craig.

On the Committee of Final Resolutions I will appoint Arthur Smith John Canning and P. W. Popp.

President Everitt: Is there any other business to bring before the meeting? It not, a motion for adjournment is in order.

Mr. Craig: I move that we adjourn, Mr. President.

Secretary Ebel: Mr. Chairman and members, before adjournment I want to make a motion that we extend a rising vote of thanks to our retiring president for the efforts he has put forward in the interests of the National Association and for the great success of his administration.

(The motion was seconded and was unanimously carried by all

members rising.)

President Everitt: Gentlemen, I thank you for your kindness, but I am afraid I have not done very much, but what I have done has been done with good faith. Thank you.

(The motion to adjourn was seconded and carried.) President Everitt: It is so ordered. Adjourned.

#### THE EVENING'S ENTERTAINMENT.

Following the adjournment of the convention, the gathering assembled in the dining room of Horticultural Hall, and became the guests of the horticultural interests and Gardeners' and Florists' Club of Boston. An excellent repast was served, and an entertaining musical program was provided while the inner man was being satisfied. At the conclusion of the meal, Wm. J. Kennedy, of the Arrangements Committee, announced Wm. N. Craig toastmaster of the evening, who, after welcoming the visitors to the festive board, introduced J. M. K. L. Farqubar, president of the Massachusetts Horticultural Society. Mr. Farquhar extended the greetings of that society, declaring that it would always be glad to welcome the N. A. G. within the walls of its buildings. He congratulated the association on its choice for president and lauded the energy and integrity of W. N. Craig. The next speaker was Patrick Welch, president of the Society of American Florists, who tendered the felicitations of the members of the S. A. F. to members of the N. A. G., and spoke of the opportunities in the world of horticulture for both organizations. Capt. John Dillon, chairman of the Boston Park Commissioner, referred to the profession of gardening as the first but also the noblest of all professions. Wm. Kleinheinz spoke on the National Flower Show to be held in Philadelphia in 1916. H. W. Bartsch, president of the Gardeners' and Florists' Club of Boston, responded for that organization, and President J. W. Everitt for the National Association of Gardeners.

A long list of speakers followed, among whom may be mentioned Wm. J. Stewart, editor of Horticulture; Arno H. Nehrling, Professor of Floriculture, Amherst College, Massachusetts; Wm. P. Rich, secretary Massachusetts Horticultural Society; Arthur Smith, John Canning, P. W. Popp, James MacMachau, M. C. Ebel, John F. Huss, Wm. Downs, Duncan Finlayson, Robert Cameron, James Methyen, Wm. J. Kennedy, Samuel Goddard, Peter Fisher, Joseph Manda, James Wheeler, Wm. Nicholson, M. H. Norton and

A. P. Calder.

The praises of W. N. Craig as an able executive was proclaimed by many of the speakers, and that his election to the presidency of the National Association of Gardeners would, it was freely

predicted, bring material growth to the organization.

Some mention is due the committee, and its carefully prepared plans for the entertainment of the visiting gardeners. The horticultural interests of Boston were represented on the committee by Messrs, Farquhar, Roland and Shea. The Gardeners' and Florists' Club of Boston by Messrs, Craig, Finlayson and Kennedy,

#### FRIDAY, DECEMBER 10.

The day following the convention was given up to an auto ride to points of horticultural interest in and around Boston. A party of fifty, piloted by James B. Shea, superintendent of the Boston Park System, started from the Copley Square Hotel, at 10 a. m. Many regrets were expressed that Secretary Ebel's physical condition would not allow him to join the party, he and his son taking

the 10 a, m, train to New York.

Passing down Commonwealth avenue the Fenways and Park Boulevards, beautiful Jamaica Pond, with its placid waters dotted with thousands of water fowl, came in view skirting the shores on the Brookline side. Professor C. S. Sargent's noted estate "Holm Lea" was first visited. There is no attempt here at any artificial gardening; the one hundred and fifty acres of ground are beautifully wooded and of such a rolling nature that fresh surprises are constantly coming into view. Outdoors, the specimen trees and shrubs, including grand collections of rhododendrons and azaleas are noted; while under glass special features are the grand collection of Nerines, Clivias. Azalea Indica, Trachelosperum and standard Wistarias.

The next stop was made at Larz Anderson's, where Duncan Finlayson presides. An inspection of the Japanese and Italian

garden was made. The greenhouses were visited where the roses, carnations, orchids (especially Calanthes), cyclamens, etc., looked well. Refreshments were served and a start was made via Newton street to Falkner Farm, the estate of F. D. Brandegee, where W. N. Craig has charge. A short stop was made to look over the Italian garden, and other outdoor features and enjoy the extensive

Going by way of Centre street, Jamaica Plains, the first call was at the Administration Building of the Arnold Arboretum, where the visitors were cordially welcomed by Messrs. E. H. Wilson and Faxon, of the Arboretum staff. A short stay was made and a hurried inspection made of the splendid library of over 20,000 volumes, principally of a botanical and arborcultural nature, and the collection of dried specimens, woods, etc. Mr. Wilson accompanied the party on a tour of the Arboretum grounds, which cover 270 acres, and where practically every tree and shrub hardy in the northern hemisphere is to be found. A short stroll was made through the collection of 400 varieties of new Chinese plants. At the foot of beautiful Hemlock Hill, the banks of Kalmias and Rhododendrons with their deep majestic, but warm looking background of hemlocks, looked very attractive even in mid December, with the temperature many degrees below freezing and a keen New England wind blowing.

Franklin Park, over five hundred acres in area, was the next place visited. Here the new bird houses and elephant houses were inspected. Leaving here, the route lay via Metropolitan and Blue Hill avenues to the extensive Blue Hill Metropolitan Reservation, many thousand acres in extent, a circuit being made of big Blue Hill. On the home journey the Dedham Nurseries of R. and J. Farquhar & Co. were visited and here an excellent lunch, much appreciated, was served, following which an inspection of the extensive greenhouses was made. Of particular interest were large batches of the charming lavender blue Erlangea Compositae. Large batches of stove, greenhouse and hardy herbaceous stock in pots were noted; also many thousands of seedling rhododendrons, azaleas, piceas, etc.

A hearty vote of thanks, on motion of James Stuart, of Mamaroneck, N. Y., was voted to Messrs. Farquhar & Co. J. K. M. L. Farquhar expressed his pleasure at seeing so many present and hoped he might soon be able to welcome them again. Robert Laurie, the greenhouse manager, and J. Van Leemven, nursery manager, had everything in fine shape here.

The return journey to Boston was made so that the visitors reached the city ere dusk after a very pleasant day of sight-seeing.

#### SATURDAY, OCTOBER 10.

On Saturday morning a number of the visiting gardeners left Boston for Hartford, Conn., where they were met on their arrival by Wallace R. Pierson. After being entertained at a luncheon by Mr. Pierson at the Hotel Bond, the party proceeded by automobiles to Cromwell, Conn., where the exensive growing establishment of A. N. Pierson, Inc., is located. After a number of hours spent in inspecting this mammoth florist industry, where much was found of interest to the gardeners, the members of the party departed in their different directions, all acclaiming the 1915 convention of the National Association of Gardeners the most successful in its history in every particular.

#### REPORT OF COMMITTEE ON FINAL RESOLUTIONS.

RESOLVED. That a hearty vote of thanks and appreciation from the members of the National Association of Gardeners be tendered to Hon. Mayor James A. Curley, of Boston, Capt. John H. Dillon, Chairman of the Park Commission of Boston, J. K. M. L. President Massachusetts Horticultural Society, and Patrick Welch, President Society of American Florists, for the cordial welcome extended to those attending the annual convention held in that city December 9-10.

To the Massachusetts Horticultural Society which so generously provided the facilities within its building for holding the

convention.

To the Gardeners' and Florists' Club, and the horticultural interests of Boston, for the excellent repast and entertainment tendered the members.

To the Park Department and its superintendent, James B. Shea, for the automobile trip through the parks of Boston, the Arnold Arboretum and private estates.

To R. & J. Farquhar & Company for the excellent luncheon

served to the automobile party at their Dedham Nurseries.

To our local Committee on Arrangements, W. N. Craig, Duncan Finlayson and William J. Kennedy, which so ably arranged the affairs of the convention.

ARTHUR SMITH, JOHN CANNING, P. W. POPP, Committee on Final Resolutions.

#### AMERICAN ASSOCIATION OF PARK SUPERINTENDENTS

OFFICIAL COMMUNICATIONS.

EMIL T. MISCHE, President, Portland, Ore. R. W. COTTERILL, Sec.-Treas., Seattle, Washington.

#### FROM THE PRESIDENT.

Within the past five years public recreation administration has undergone a switt and radical transformation. We were told that the old idea of parks being beautiful is antiquated rot, they must be used for tramping on and play of some sort; that park commissioners were not proper officials to administer public recreation and about equally impotent were school boards. New York City and about equally impotent were school hoards. New York City was one taking early action in establishing a "Recreation Commission" to conduct these affairs of social welfare.

A bill was recently passed empowering the commissioners of New York parks, to control all playgrounds and recreational property outside of that under the jurisdiction of the Board of Educa-The Public Recreation Commission approved the action of abolishing its existence.

It is suggested that some explanation of the influences and causes of this action, also the trend of the recreational movement, be discussed in these columns by the principal officials affected by the changes.

It would appear that in the first flush of enthusiasm, some acts of the proponents of social welfare have gone too far and this is the reflex action setting in.

Our ideas on community responsibility for individual well being is ever increasing, broadening and deepening. The more readily we can separate the fads and foolishness always attaching to any landable movement from the real ment the quicker will be our real advance. Let us have light!

#### SUSTAINING MEMBERS.

Superintendent A. A. Fisk, of Racine, Wis., has come forward with a suggestion which is worthy of consideration by every member, regarding securing park commissioners, city officials and others as Sustaining Members in accordance with the new constitutional amendment passed at the San Francisco convention, which makes it possible for any person directly or indirectly connected with or interested in park work, becoming a member of our association as a Sustaining Member, contributing 810 per

Such members will be privileged to attend our conventions as non-voting members, will receive our monthly magazine and other bulletins and publications and will undoubtedly receive from fellow members park reports from all over the country as well as being able to secure information by correspondence, etc., from fellow members.

Mr. Fisk believes that if our members will take hold of this matter that many recruits can be secured and our association strengthened financially and otherwise. He suggests that members who have reason to think that members of their board or commission would join the association, request the secretary to send them a letter setting forth the possibility and desirability of sustaining membership and asking him to bring the matter to the attention of his board. This will give him an excuse to bring the matter up and may help in getting results.

Such a letter has been sent to Mr. Fisk, and the secretary will be glad on request to write such a letter to any member who thinks it will be a help. The president and secretary now have full power to accept and enroll Sustaining Members at any time, so all that is necessary is to send in the name and the money, with the endorsement of a member.

If the association can secure, say 50 Sustaining Members, which is not at all impossible, it would mean that we would be able to issue more valuable bulletins and pamphlets, which would be of. benefit to all.

A quarterly bulletin would be a fine thing, but it is out of the question with our present revenues. Increased revenue means increased usefulness of our organization through a greater dissemination of data.

Here is a chance to help the association and help yourself at the same time. We will publish a Roll of Honor of those who secure one or more Sustaining Members and your officers hope it will be a long one.

The Secretary has on hand at all times a list of members who are either disengaged or on the lookout for a new or better assignment, therefore members who have information as to prospective openings should supply the Secretary with same and he will do the follow-up work.

"It's little for many that one can do, but the many can always help one."

#### IN MEMORIAM.

Following a protracted illness extending over a period of a year

and a half. Chas. G. Carpenter, for eleven years superintendent of the Milwaukee Park Department, died on November 15.

Mr. Carpenter was 57 years of age and was born in Windsor, Wis. He graduated from the University of Wisconsin as a civil engineer, a profession, however, which he never followed. After his graduation he went to Omaha, where he established himself as a landscape gardener, remaining there until 1904, when he went to Milwaukee to take charge of the park system of that city

About a year and a half ago he suffered a stroke of paralysis and this, together with heart trouble and arterial sclerosis, was the cause of his death. During all of his long illness the Park Board of Milwaukee, fully appreciative of his work in that city, held his position open.

He is survived by a widow, two sons and two daughters, and it goes without saying that the sympathy of our membership goes. out to the members of the bereaved family.

CPARILS G CARPINTER

Mr. Carpenter always took an active interest in the affairs of the association, becoming a member in 1908 at the Minneapolissession and afterwards attended the sessions at Harrisburg, Kansas City, Boston and Denver. He had served as vice-president and was usually a member of the important committees which had to do with the shaping of the policies of the association. At the recent San Francisco convention he was given a heavy complimentary vote for president, and had he been present would have probably been elected. In the death of Mr. Carpenter the city of Milwaukee loses a most efficient park executive, and our association loses one of its most respected and valuable members.

#### PERSONAL AND OTHERWISE.

Wm. S. Egerton, after thirty-nine years of service in the Albany, N. Y., park department, has given up the position of superintendent and is devoting himself to consultation work as landscape architect and engineer, which he finds both agreeable and remunerative. Mr. Egerton is a veteran member of our association and was its president in 1904.

Clarence L. Brock, superintendent at Houston, Texas, is a busy man preparing the convention gardens in Sam Houston Park for the 1916 convention of the Society of American Florists and Ornamental Horticulturists

Mr. Brock will undoubtedly be with us at the New Orleans convention, and hopes that many of our members will be able to include Houston in their itinerary.

John D. McEwen, superintendent of Queensborough park department, New York, is the latest victim of the New York City system of changes and reorganization or disorganization, whichever you may prefer to call it.

His position has been abolished and he is to retire on January 1. Mr. McEwen is one of the new members of the association, a man of culture and ability, and made many warm friends while touring

with the convention party last August. In New York he has made a most excellent record as an organizer and systematizer, and it is unfortunate that he is to leave park work in the metropolis. His brief experience in municipal work has convinced him that his former field, that of manager of private estates, is preferable, and he is now on the lookout for such a position and will appreciate information along that line.

Byron Worthen, a veteran member of our association, who has been superintendent of parks at Manchester, N. H., for many years, is now on the retired list, having been the victim of political interference which seems to have invaded staid old New England, Mr. Worthen served for two years as vice-president and was president in 1906. He has been a regular attendant at conventions, has taken a great interest in the association, and hopes to meet with us again regardless of whether he takes up public work again or not.

The proceedings of the San Francisco convention will be published next month and will be sent to all members.

Charles M. Loring writes from Minneapolis that he will be at Riverside. Cal., in charge of Huntington Park in December and for the balance of the winter. Mr. Loring is one of those lucky individuals who is able to spend his winters in California and his summers at his old home in Minneapolis. We fully expected to meet him at the San Francisco convention and have him organize a party to look over the wonderful work he has accomplished at Riverside, but he failed us and we were denied a great pleasure. Mr. Loring is a double member, that is, he was voted an Honorary Membership on account of his public service in moulding the great park system at Minneapolis, and he keeps up an active membership by reason of his desire to contribute to the support of the association and to participate in its councils.

Superintendent J. W. Thompson and Engineer H. L. McGillis, of Seattle, recently completed a study and plan for the improvement of the State Training School at Grand Mound, Wash. Last year they made a plan for the State Capitol Grounds at Olympia, and the Board of Control was so pleased with their work that they are being consulted in connection with the improvement of the grounds of various State institutions.

New York City is certainly attaining a reputation, which can hardly be said to be creditable, of continually changing its park administrative officials. Fully a dozen efficient park executives have been displaced during recent years, largely from political reasons, and each change brings on a general shake-up which naturally results in disorganization.

It is indeed unfortunate that the metropolis of the nation should indulge in such a practice for it should be a model in municipal

The cities of this country which have made the best showing in recreation matters are those which have built up and maintained, absolutely divorced from politics, an efficient park organization.

The following have been dropped from our rolls on account of non-payment of dues, but can again become members by paying full arrears:

John H. Allen, New York; H. A. Allspach, Sacramento: David E. Austen, New York; John Boddy, Cleveland; A. H. Browne, Saskatoon: Frank Brubeek, Terre Haute; G. H. Burgevin, New York; Nicholas Byhower, Salt Lake City; O. W. Crabbs, Muncie, Ind.; Thos, E. Davies, Ottawa: Wm. Donaldson, Buffalo; N. F. Flitton, Baltimore: Fred Gabelman, Kansas City; Joseph Gatringer, New York; W. A. Gorman, Brooklyn; A. J. Graham, Denver; Fred C. Hoth, Jersey City; Richard Iwerson, Calgary; C. R. Jones, Baltimore; J. W. Kernan, Lowell; Samuel Parsons, New York; Felix Riesenberg, New York; Jas, Underwood, Columbus; B. VanderSchuit, Ogden; James Wait, Walla Walla; Chas, A. Whittet, Los Angeles; J. W. Meredith, Toronto; W. C. Niesen, Chicago; W. O. Thompson, Portland, Me.; R. W. Thornton, Denver: J. T. Withers, Jersey (ity.

#### CONVENTION TRIP OF PARK SUPERINTENDENTS.

Continued from November.

Monday, August 30.—At 5:30 a.m. we entered the plains of Utah, where we saw thousands of cattle browsing. Here and there was a little hut, the home of some lonely ranchman—Bunch grass seemed to be the only vegetation for miles and miles. In fact, from 7:30 till 11:30, we saw little else. The soil was composed of considerable alkali and sund. Then we passed through about two miles of red codars and again, the almost bare alkali

plains, with the mountains in the distance. We saw several whirlwinds sweeping across the sandy desert. At 2 p. m. we came in sight of Great Salt Lake, a beautiful body of water. Along the edge were myriads of butterflies. As we approached the city the land for miles was white with salt. We arrived at Salt Lake City about 2:15 p. m. and found that ex-Governor Wells, who is now Park Commissioner, had sent Mr. L. S. Mariger, Transportation Agent, to look after our party, as Mr. Hobday, Park Superintendent, had been called away to fight forest fires. We boarded a sight-seeing bus at the depot and were shown, among other things, Pioneer Park and playgrounds, comprising ten acres; the Mormon Temple, Hotel Utah, containing five hundred rooms, and the State Capitol, a most impressive structure at the head of one of the principal streets, right at the foot of the Wasatch range of the Rockies. The streets are 100 feet wide, with 16-foot sidewalks on either side, and the gutters are flowing streams. The water is afterwards used for irrigation. We next went to Liberty Park, containing 100 acres, presented to the city by Brigham Young, the husband of 19 wives and father of over 40 children. Then we went to the Old Mill, built by Brigham Young in 1852, and to Washington Square, containing 10 acres, in which is located the City Hall. Salt Lake City is 4.260 feet above sea level. At 5:15 we left the city via the Denver and Rio Grande Railroad, through the beautiful Utah Valley, where fruits, vegetables, grains and alfalfa grow in abundance, passing Lake Utah, a fresh water lake. We ran along the River Jordan, which connects the Great Salt Lake and Lake Utah, as the Jordan of Palestine connects the Sea of Galilee with the Dead Sea. From the car window we saw the rugged Wasatch Range and to the westward the blue range of the Oquirrh. As evening came on, with a most glorious sunset reflected on the mountains, we passed the Strawberry Valley Irrigation Tunnel of the U. S. Reclamation Service. At 7:50 we reached the picturesque mountain station of Thistle. Lights began to appear in miners' huts as we climbed to an altitude of 7.454 feet, at Soldiers' Pass, one of the highest stations in the Rockies, through the Red Narrows and the crest of the Wasatch Then down we rushed into the dark of the night, drop-Divide. ping down between three and four thousand feet by midnight, when we crossed the boundary from Utah into Colorado,

Tuesday, August 31.—At early dawn we stopped at Glenwood Springs, where the porter told us of the wonderful hot sulphur springs on Mount Sopris, where the Roaring Fork River empties into the Grand, and where are located extensive bathing pavilions and swimming pools. As the sun lifted its head over the Canyon of the Grand River we began to climb to the Eagle River Canyon. where, from the diner at breakfast, we saw the miners' huts. which seemed to be fastened to the almost perpendicular walls. Up, up, our train climbed, till we reached an altitude of 10,240 feet, at Tennessee Pass, the highest point on the road; then down again, soon entering the Grand Canyon of the Arkansas, where, at Texas Creek, an open observation car was attached to the train, and as many as could crowded into the seats and aisles to witness the most wonderful mountain scenery of the whole trip, through the Royal Gorge, with its red granite walls sparkling with mica, towering to heights of upwards of 2,600 feet in places. One could reach out and touch the jagged sides, almost trembled with fear lest some of the mighty rocks should let go their hold and crush us under their thousands of tons of weight. Yet, with all our fears, the grandeur of the scene fascinated the most timid and brought us to a realization of our own insignificance. After an hour of this wonderful, weird and awe-inspiring scenery, during which we passed over the hanging bridge, the observation car was taken off and we proceeded down, past busy mining camps, cement works and oil wells. We arrived at Pueblo, a city of 50,000 inhabitants, about 4 p. m. We were met by Superintendent Gus Hennenhofer, City Commissioner Thomas A. Duke and a representative of the Pueblo Chieftain. The city has a wonderful irrigation ditch, the water flowing through the streets, fine schools and a court house which is an architectural monument. We had a ride through the city in autos to City Park, Bruner Park, with its beautiful Lake Minnequa, past the iron works and hospital to Mineral Palace Park, and then back to the fine, homelike Congress Hotel, where a delightful dinner was served by the City Fathers. speeches of welcome and thanks in return, we were invited to the home of Superintendent Hennenhofer, where a lawn party was enjoyed. Refreshments were served by the wife and daughter of our host, amid colored electric lights, which made the grounds look like a fairyland. After several hours, all agreed that the day and evening had been one of the most enjoyable we had experienced. We went back to the hotel for a wellearned night of rest.

Wednesday, September 1.—In the morning we were joined by Superinterdent Henvenhofer, his wife and daughter, who proceeded with us to Colorado Springs on the 8:15 a.m. train. The run only took about one and one-half hours, through fertile farm lands. We arrived at the Rio Grande Depot at 9:45 a.m.,

where the car Marion was side-tracked. We were met by our congenial tellow-member, Mr. C. U. Fohn, who had preceded us, to be home in time to arrange for our coming. He was ably assisted by a committee consisting of John Lang, Superintendent of Parks: T. P. McKown, City Torester, Stephen Clarke, Landscape Gardener and the Misses Bartholomew, daughters of the City Treasurer. We embarked in autos to Seven Falls and South Cheyonne Canyon, where we climbed 287 steps and down again. Each of the seven falls dropped almost perpendicularly to the ledges below. Here we saw many donkey parties riding up the canyon on the little, shrewd-looking, sure-footed burros. We were shown Monument Valley Park and the Ute Pass, the only trail through the Rockies known to the Indians for many generations. Away in the distance, towering above all, was Pike's Peak, which lack of time prevented us from visiting. We next went up the Moss Road to Glen Lyrie where eagles' nests in the rocks, and, arriving at the magnificent Palmer Castle, we were treated to a most delicious buffet lunch served by Mr. Fohn's housekeeper, Mrs. Jones. The sideboard in the banquet hall was loaded with great platters of ham roll sandwiches, raw meat and onion rye bread sandwiches, lobster, potato, lettuce and tomato salads, pickles, olives, crackers and cheese, Saratoga chips lengt de offee and beer being the tiquid end of the menu. (This menu is published for the benefit of some of the ladies who expressed a wish to have it? After him been we were shown through the eastle. It contains 114 rooms, all beautifully furnished, and sixteen bath rooms, finished in Delft blue tiling and equipped with most modern fittings. In the octagon belfry, over the studio, the great bell hangs, to call the huntsmen home and to ring an alarm, if necessary. The roof of the eastle is covered with hand-carved tiling taken from an old. dismantled church in England. There is a great ballroom, all oak panelled, with a ceiling 25 feet from the floor and an immense gallery. The estate contains about 5,000 acres, open to the public. General Palmer also presented to the city Monument Valley Park, containing 1.500 acres; Palmer Park and North Cheyenne Canyon. He also built the High Drive, 14 miles long. After inspecting the castle, dancing, bowling and playing billiards. we again entered the autos and away we went over the Ridge Road to Manitou, where the mineral springs are located. We visited Soda Springs and Ute Iron Spring, 6,530 feet above sea level, and all drank treely of the waters, much to the seriet of some and with much joy to others.

Next we went to the celebrated Balanced Rock and through the west gate of the Garden of the Gods, seeing the Ship Rock, the Twins, the Scotch Cap and the Kissing Camels, and then to the Hidden Inn, where the City Fathers had provided a sumptions dinner, served by maidens dressed like Alpine peasants. After dinner we were entertained by a family of Pueblo Indians in their picturesque dress, the children dancing to the song of the old chief and accompanied by the music (?) of the tom toms. Mr. Henry W. Busch thanked the officials in a well-delivered speech, which was responded to by Congressman to B. Schlomridge on behalf of Colorado Springs. Then all boarded the autos for the lottel

Thursday, September 2 First the hotel at 9500 a in for Den The trip was uneventful. We arrived in Deuver at about 12:15 p. m. and were met by the local committee. We were met at the depot, where six autos were waiting. Under the guidance of a very capable committee, consisting of Superintendent of Parks Fred C. Steinhauer; Thomas J. Patterson, of the Denver Athletic Club: H. F. Meryweather, City Engineer: A. H. Coykendall and William J. Kirkman, we proceeded on one of the most enjoyable auto rides of the whole trip, 12 miles, to tolden. passed the lower reservoir and went up the Highland Park Road. winding around and around the mountains in urany hairpin turns to the top of Lookout Mountain, 7,500 feet high. Then we went over a most beautiful plateau, each turn in the road revealing grander scenery of the surrounding mountains and lower lands in panoramie succession. Then we went up and up to the top of he found Old Glory flying in the delight Grijosce Mountain Aberfully dry air, 8,270 feet above sea level. On these mountains is an animal enclosure covering 130 acres, with fields of alfalfa for the herd of twenty-three clk and five buffaloes. Then we descended on the other side, down the canyon through which Bear Creek rushes and leaps amid the rocks and where there nestle many beautiful little summer cottages built of Douglas Fir slabs, in most picturesque style, to the little settlements of Evergreen, Spruce Glen and Ryan's Camp, where over two hundred of the Park Department road workers live in tents. On down the beau tiful glen we rushed, crossing and recrossing the stream as the high, rocky walls forced the road builders to take the line of least resistance. And so down we went for ten miles or more and then out on the plains when, suddenly at a sharp turn in the road, we came across a wrecked auto and fresh, undried blood. indicating a very recent accident. As our chauffeur did not recognize the car, we were assured it was none of our party, although it was very depressing for the time being. We were soon in the city again and through the principal residence street, with handsome homes and grounds. Then we went over the South Platte River and railroad tracks by way of the viaduct, a mile long. Denver coves  $58^3_{-4}$  square miles, has 213,000 population and is 5,200 feet above sea level. Arriving at the depot at 6 p. m. we found we had covered over 52 miles between 1:30 and 6 o'clock. After a fine dinner at the Oxford Hotel we boarded our car at 7 p. m. and pulled out, taking with us most pleasant recollections of Denver, with its rarified air, congenial people and beautiful location amid the mountains. In crossing the prairies during the night the wind howled as if it were winter.

Friday, September 3, 5 a. m. A beautiful, cool morning, found us rushing east through Kansas, with its great stretches of corn fields and many orchards near the prosperous villages and towns, pasture lands, with large herds of cows and droves of horses, fields of alfalfa, oats, wheat and broom corn. Republican River was crossed, with its muddy water flowing down to the Missomi. The cattle here are very large, of the Poled Angus and Herefordshire varieties. The brown, mule footed pigs are seen in great a index. We made some at Large. Goodland, Colby, Norton, Phillipsburg, where the time changes to one hour earlier. On we went, to the Kaw River, another arm of the Missouri. Just outside of the city of Topeka we saw a traction engine drawing a large number of plows. We arrived at Kansas City at 5:50 p. m., two hours late.

We were received by Park Commissioner General Cusil Lechtman, Lantier of Architect George Lakes near, Excentive Officer A. W. Graham, Superintendent of Parks Thomas Callahan and Messrs, Ralph Benedict and Thomas Harrington, of the Park Board. With seven autos we were rushed through the city to all the points of interest, past beautiful homes, arriving at Swope Park, where an outdoor lunch was served. As night had overtaken us, on account of our delayed arrival, it was necessary to use the searchlights of the autos to light the tables. As it was not expected we would be so late no other lights had been provided. Considering the short time we had to spend there, our Kansas City visit was most pleasant, and the committee did all in its power to make our short stay enjoyable, even to liquid refreshments at a fine hotel at 11 p. m., our train not leaving until 11:45.

Saturday, September 4, 6 a. m. A beautiful, cool morning. We rushed through Missouri, along the river of the same name, with rolling country on one side and level farm land on the other, with abundance of hay and corn, and farmers plowing in many places, and signs of prosperity everywhere. We rolled into St. Louis at 8 a. m. We had breakfast in the depot dining room, and were met by Mr. and Mrs. L. P. Jenson, who had left our party in the Far West to hasten home to arrange for our reception. After a short walk we arrived at the City Hall, where we were met by a committee consisting of Park Commissioner Nelson Cunliff, Superintendent Ernest Strohle, R. H. Adeken, Superintendent of Playgrounds; Russell Gibson, of the Construction Department; W. W. Ohlweiler, manager of the Missouri Botanical Gardens, and Mr. Gorge C. Smith

While the ladies were being introduced to the City Fathers, Messrs. Stuart, Gross and McEwen started for the bank in an auto driven by Mr. Smith. As they approached a corner, a trolley suddenly stopped and Mr. Smith was compelled to put on his brakes, with the result that he slid down on the car. At that moment Police Officer No. 1462 stuck out his hand, as a sign to stop, but the momentum carried them on a few feet, then Mr. Officer concluded it was time to make an arrest. So, neglecting the unprotected crossing, he ordered them off to the station house, where Mr. Smith was notified to appear Monday morning in the court for disregarding traffic regulations. Nothing was said, however, about the officer leaving the crossing unprotected for over an hour, when a small piece of paper in the form of a summons would have served the purpose and saved our men folks considerable discomfort.

Eight autos were provided and the profession started for Forest Park, where the chief points of interest were Art Hill, the Jefferson Memorial and the World's Fair Pavilion. Then we went through the beautiful residential section of Portland Place and Kings Highway to Natural Bridge: then to O'Farrel Park and Fair Grounds, consisting of 425 acres, where a pageant is held annually in which ten thousand people participate and from 80,000 to 120,000 attend daily. Next we went to St. Louis Park, containing the largest swimming pool in the United States, then to Jackson and Mullaphy parks, Columbus square and, at 1 o'clock, to the City Club for luncheon. Here we met a number of the public spirited citizens, who entertained us to eats and speeches, Mr. John Blair Edwards, the president of the club, invited our criticism of the city. Mr. Merkel, in response, introduced Mr. Busch as the one man in our party who could make a speech, and afterwards introduced Mr. Stuart for his maiden address. Although it was his first speech, it will long be remembered as one of the warmest criticisms made by our party in any of the cities visited. The applause indicated that it was fully appreciated by both our bosts and our own party. After luncheon, at the

invitation of Mr. August Busch, the celebrated Anheuser-Busch brewery was visited, and each member of the party received a handsome souvenir in the form of a booklet entitled "Epoch Making Events of American History," showing copies of celebrated historical pictures. Then we went to Benton and Gravois parks, South Side Pool, Riverside Drive, 150 feet above the Mississippi, where we saw a number of oarsmen in sculls; then to Carondelet and Tower Grove parks and to the celebrated Missouri Botanical Gardens, presented by Henry Shaw to the city in 1860. Then away we sped again to Forrest Park, where an outdoor luncheon was served at the pavilion of the World's Fair Grounds. After a much-needed rest, the evening lights showing in the city. we proceeded down-town to Carr Park, where we enjoyed several numbers of the band concert and then to Mullanphy Pool, to witness the bathing of the working people, who are unable to enjoy the pools in the day time. Next we went to Hyde Park, where we saw about 2,000 children and 3,000 grown-up people enjoying free moving pictures; then to one of the combination bath houses, where tubs, showers and swimming pool are provided, all gratis, the small charge of one cent for towel, one cent for soap and three cents for the suit, being made if the bather does not provide his own. At 10 p. m. we all got back to the depot for the last leg of our journey. The party divided about evenly, half going north and the balance east. With a hearty farewell to each other and to our kind host and hostess, Mr. and Mrs. L. P. Jensen, our trains pulled out at 11 and 11:05, respectively, homeward bound.

Sunday, September 5. We were awakened in the morning by a great racket. On looking out we found we were at Indianapolis. Ind. There was a freight train opposite our car, from which was being loaded machinery and cattle. The confusion and noise was awful. After leaving Indianapolis we soon got out into the corn fields, and by 11 o'clock we were well into Ohio. At 11:15 we pulled out of Dayton and saw the derricks of many oil wells. we were all very tired, not having gotten to bed until midnight. no one was up early. In fact, several of the party did not get up till nearly noon. As it was raining, everything looked fresh and green. As we passed through Ohio we looked out on delightful rolling country, with wonderful fertile farms and frequent droves of hogs and large herds of cattle. After crossing the Allegheny River at Steubenville, we were soon into Pennsylvania, and the scenery became more beautiful, with fertile valleys and mountains stretching to the north as far as the eye could reach, with majestic wooded hills and here and there bold mountains in the distance to the south, reminding one of our own Hudson Valley more than any scenery we had yet seen. And so the day were on, the rain stopped, and evening came on, bringing with its curtain of darkness an overwhelming desire to sleep. So all retired early, to be awakened by the porter at 6 a. m., who later announced our arrival on time at just 7 a.m.

Monday, September 6.—M. C. Ebel boarded the train at Newark,

and we were all invited to be his guests at breakfast on arrival at New York, which invitation the party accepted. Amid stimulating draughts of coffee, we told of our wonderful trip and its many exciting adventures. After warm adieus we parted for our several homes, to talk and ponder over one of the most delightful trips ever taken by any organization from the Atlantic to the Pacific and return.

This little story is contributed in the hope that all who read may learn that the American Association of Park Superintendents know when, where and how to get enjoyment out of life and with the best of fellowship, to return home realizing that "a man's a man for a' that."

In this issue the story of the adventures of the Park Superintendents and their friends on their convention trip to the Pacific Coast and return is concluded. It was probably one of the most remarkable trips ever undertaken by any organization, offering as it did every opportunity to the travelers to accummulate the knowledge they sought while continuously engaged in the pursuit of pleasure. We are indebted to Mrs. John D. McEwen, of Queens, New York, for the entertaining description of the trip, which was obtained from her interesting diary of the events as they occurred from day to day .- Editor-

As a member of the party that accompanied the park superintendents on their trip to the Pacific Coast and return, I want to express my appreciation of the warm hospitality that was accorded me by the park superintendents enroute and also by the park officials at every one of our stopping points.

I have traveled much and mixed much, but never in my long experience have I come across a body of men who could equal the park superintendents in the genuine good fellowship they manifested during our entire trip, and I wish to thank them for all the courtesies extended to me while traveling with them. E. W. SCHONEBERGER.

#### PROPOSED PARKING SYSTEM FOR ESSEX COUNTY, NEW JERSEY.

Parkways are man made. Their function is to provide traffic facilities with a distinct park character. As such, there are narrow tree lined streets of a boulevard type, broad spacious ways subdivided so as to care for separate lines of travel, like auto, equestrian, commercial, pleasure and pedestrian. They may be narrow to the point of meanness or wide to the extent of being luxurious. Some are formal, others informal; some on rolling slopes, whereas others are on flat planes.

People build according to their ideals, their public spirit and their affluence, And there is always the sham to be seen as an evidence of commercialism attempting to gain the advantage of parkway value on too limited an area.

That a handsome and dignified parkway serves a worthy purpose there can be little doubt; that it is an object for generous community investment is demonstrable. A community inspires admiration of people in proportion to the respect it proves by its work it has for itself. Public works and administration are the common means of displaying that self-regard and refinement.

To discriminate between real excellences and works passing therefor, to point the cost of the different types, the means of securing them in fit locations, and to outline the sections to be traversed and connected by proposed routes, is the purpose of this report. It was written by Mr. J. C. Olmsted, of the firm of Olmsted Brothers, in the course of advising the Essex County Park Commission. A copy was kindly forwarded by Mr. Olmsted.

For more than fifteen years have the Olmsted Brothers been the professional advisors of Essex County in park development. Millions of dollars have been expended there in executing parks, playgrounds and reservation plans of this firm, and later a disposition has become manifest that these properties should be connected by pleasure routes. In the report Mr. Olmsted brings out some novel views, such as proposing electric car routes in the parkways, because they tend to supply the greatest good to the greatest number. Rapid transit considerations, park laws, assessment methods, restrictions on abutting properties are discussed in detail. Another striking feature is the proposal to create, possibly with State aid, rapid transit parkways from the New Jersev mouth of the North River tubes to Essex, Passaic, Bergen and Hudson Counties, involving the congeries of communities on the Jersev side of the river. It is a vast scheme of almost startling scope.

In breadth of vision, in practical conception of future needs and immediate wants, and in the financial capacity to execute them, Mr. Olmsted sustains in this report his former tradition of being a safe, wise, practical, and talented counsellor.

And with these merits plainly discernible by the lay mind, there is a clear evidence of an artist speaking for the creation of beauty.

Altogether, the report clarifies the atmosphere by separating the mists of vague dispelling impressions and heretical procedures, too often attempted in parkway construction, and gives authoritative and clear dictum of public park works, and outlines the returns they bring if developed according to known formulæ and principles.

By this report Mr. Olmsted has accomplished a good work for the nation quite as much as for the Park Commission of Essex County.

Madison, N. J., December 10, 1915.

#### Boston's Mayor for Sunday Recreation in Parks'

Mr. Chairman and Members of the National Gardeners' Association, it is indeed an exceeding pleasure to greet this organization in a building that is dedicated to the profession that you represent—Horticultural Hall. It is singular, however, in the matter of the administration and the development of our park system that it became necessary for the present mayor of Boston to make a 4000-mile journey to discover that the very element most necessary to the proper development of our park system obtained here in our own city. In other words, I visited, like many other Americans during the past year, the Panama-Pacific Exposition and was fortunate enough to be able to visit the San Diego Exposition, and there discovered the most beautiful park that I believe there is in the entire world—the park system in connection with the San Diego Exposition. I, of course, was naturally and extremely desirous of learning who the genius was that laid out the beautiful parking system of San Diego, and I was informed by the vice-president of the San Diego Exposition Commission that it was the Olmstead Bros., of Massachusetts.

I visited Portland, the beautiful rose city of the Pacific Coast, and traveled through their park system, and I said, "Who laid out this splendid park system?" They said, "The Olmstead Brothers of Massachusetts." And I journeyed on to Seattle and made the same inquiry there and received the same answer. then I visited Chicago on the return journey and drove through Lincoln Park, and Jefferson Park, and Washington Park, and Jackson Park, and was astonished at the extent of the area and the beauty and the service that is derived from the park system there in Chicago. I witnessed on a pleasant Sunday afternoon twenty-two ball games in progress at one time, some forty tennis courts in operation at one time, archery and golf and every other sport that is conducive to the health and well-being of the individual.

I came back impressed with the necessity for bringing here into effete Boston the idea that has been so generally accepted in the West for making Sunday a

day of recreation as well as a day of rest.

I was naturally desirous of ascertaining who the genius was that had reclaimed for park purposes such a large extent of the area that was formerly occupied by Lake Michigan, and my informant told me that the Olmstead Brothers had something to do with laving out that system. I had never met the Olmstead Brothers, but when I returned I sent for Captain Dil-Ion, the chairman of our Park Commission, and I said: "Send for the Olmstead Brothers and make a contract with them to go over our park system and make it the best park system in the entire country regardless of cost." And they are now working along those lines, and when, as guests of the Boston members of your organization tomorrow, you will be privileged to ride through the park system you will see some indication and some evidence of their skill and their ability in your chosen profession.

We have begun to realize since they have started operations that a great mass of shrubbery and of flowers is not necessarily conducive either to beauty or utility, and some of the most beautiful stretches of our Fenway, which for years have been hidden from public gaze through this great overgrowth of shrubbery, under their direction has been thinned out, and

it is possible to witness here in Boston those scenes which the old masters have reproduced on canvas for the last hundred years—a vista of a river, a vista of a church in the distance, and the entire picture framed in the most graceful and beautiful shrubbery that is common to our climate here in New England.

It is a very great pleasure to me to come here and to say that we are fully alive to the importance and to the value of our public parks; to say that our park system represents an annual expenditure of more than eight hundred thousand dollars; to say that our contribution to the State parks, in the Metropolitan District, represents an annual expenditure of about four hundred thousand dollars additional; to say that through love of Boston and of the love of God's most choicest gift to man, such fragrant flowers, the product of sunshine and the product of nature, that it has been possible through the generosity of a Boston citizen to make more serviceable and to make more beautiful our park system here; that a Mr. Parkman one of our great citizens, in his will left the sum of five and a half million dollars to the city of Boston for the development and the beautifying of our park system; that that money is being expended intelligently and with a view to beauty and service; that we have a Zoo and an Aquarium that are the equal of those to be found in any section of the entire country, and that we propose at some time in the not distant future to have a horticultural building in Boston in our park system where it will be possible for the general public to enjoy the beauty and the companionship of flowers in the winter time in just exactly the same manner as they are now enjoyed in the summer time.

But everything that can be done is being done to make our system what it should be. We have been exceedingly fortunate in the choice of men at the head of our Boston park system, men who have been affiliated with your organization, men who have been part and parcel of it, for Mr. Galvin was one of the earliest florists in this city and whose name is a household word in the matter of flowers and of everything beautiful of that nature; William Doogue, our present Park Commission; John H. Dillon, and our most companionable Superintendent, "Jim" Shea. They have all been whole-souled men, for, after all, the men who love flowers love children and love humanity, and the service they have rendered in planning wisely and in planning well for our park department is our chief asset and makes possible a higher health record and a lower death rate in Boston than any other one thing

or all other things combined.

We are grateful to the Gardeners' Association for the splendid men they have given us in their chosen profession, and as mayor of the city I trust your stay with us will be one of pleasure to you and one of profit to the community. I trust the same God that under your handiwork develops these choicest productions during your stay will bless your visit with sunshine and happiness.

#### PARK AND PLAYGROUND LEADERS MEET

The first meeting of park superintendents, commissioners and engineers ever held in Lowell, Mass., was held in the aldermanic chamber at City Hall, November 19, when the Park Institute of New England held its fifth meeting of the year, for the discussion of problems in park and playground management.

The principal address of the day was delivered by

<sup>\*</sup>Address before Convention of National Association of Gardeners, Boston, December 9.

James B. Shea, first deputy commissioner of parks, of Boston, who discussed the matter of costs of maintenance, and said that much money may be spent on parks, but something to induce the people to avail themselves of their beauties must be devised to lure them there. Other speakers were John H. Dillon, chairman of the Boston park commission; Joseph McCaffrey, supervisor of playgrounds of Providence, R. I., and George A. Parker, superintendent of public parks, Hartford, Conn. Questions were asked and answered and the discussion was at all times interesting.

George H. Hollister, manager of the Park Institute, introduced Mayor Dennis J. Murphy, who got a lot of applause from the park men.

James B. Shea, deputy park commissioner of Boston,

said, in part:

"It is, of course, to the larger cities of the country that we must look for advanced information on many of the matters which relate to parks and playgrounds. It would not be amiss, therefore, if I should present a few statistics from the great bulk of matter collected during the past few years. The city of Greater New York has a park system comprising an area of 8,600 acres, maintained at an annual expense of \$2,860,442, exclusive of the amounts expended for construction purposes, which, while varying according to the needs, total at least \$1,000,000 annually, in addition to the first mentioned amount. This area reduced to units means an acre to each 642 persons, or 1.56 acres to each 1,000 persons.

"The New York park system had its beginning in 1851. In 1853 a start was made in taking land for what is now called Central Park, embracing as you know all that territory between 50th street and 106 street, longitudinally, and from Fifth avenue to Eighth avenue, an area of 776

acres.

"It is a difficult task to give reliable statistics on the park and playground system of Chicago, as the activities of this great city are divided among a dozen or more separate executive bodies. The total annual expenditure of the community is, however, greatly in excess of \$3,000,000. In this city is to be found the latest word in playground development. In the management of its activities also it has shown the lead and we of other cities

are obliged to pay attention to it.

"Now about Boston's park and playground system. Since 1877, the year of establishment of a park commission, there has been expended \$9,000,000 for land and \$11,000,000 for construction, a total of \$20,000,000. Of this amount \$3,000,000 was spent for the purchase and development of 42 playgrounds. The total area contained in the above is 2,500 acres. In addition there are upward of 80 small parks, acquired previous to 1877, eight beach bath houses and 15 bath and gymnasium buildings open all the year.

"It is not sufficient that we select suitable sites for our parks and develop them on the most artistic lines, or that we furnish a playground with a modern gymnasium and all the facilities for sports, and then say to the public. 'There are your parks and there are your play-grounds, go in and enjoy yourself.' Oh, no, we must devise some way of enticing the public into our carefully prepared

beauty spots."

#### INSECTS ON PARK VEGETATION.

By Frid. C. Green, Rhode Island.

I note by the last issue of our official organ, the president has given us our orders and we must obey to the best of our ability. So I will try and outline our method of checking the insect pests we have no fight.

In Providence parks, during the late fall and winter

months we spray for scale, San Jose being our worst enemy in that line, although ovster shell scale is bad on certain trees, especially young White Ash, Willows, and Lilacs, but the San Jose scale attacks a very large number of shrubs and trees, especially Cydonicas, or Japan Quince, Rosa Rugosa, Cratagas, Cotomasters, Ribes, Malus, and Sorbus, Acuparia or Mountain Ash, which is a beautiful tree in the great cities of Seattle, Wash., and Portland, Ore. We use Scalecide altogether, as it does not discolor the branches like lime sulphur, neither is it caustic if blown by the wind on the hands and faces of men while using same. We find it good for a summer spray if used according to directions. We use it on broad leaved and coniferous evergreens whenever we find scale on same, also for pine louse on pines, and lace fly on Rhododendrons. We also hunt for the eggs of Gypsy Moth and creosote them by using a sponge on long bamboo poles, with ladders for climbing the large trees. I might say we spray with arsenate of lead in spring as soon as the leaves unfold, which takes care of the Gypsy Moth, Brown Tail and Tussock Moths and Caterpillars, also Elm Leaf Bettle, which is our worst pest and disfigures our Elms very badly if not attended to early in the season. We have to keep a sharp lookout for a second brood of this pest which has been known to creep on us unawares and destroy the beauty of some of our best trees before being noticed.

For Brown Tails' nests, it is very necessary to keep plenty of light tree pruners on hand and a number of men who are not afraid to climb. It will keep them busy most of the winter to get the nests if badly infested. We keep men on the ground to pick up the nests as fast as they are clipped off, and these, when collected, are promptly burned.

For the tent caterpillar, it is best to inspect all shrubbery during the winter and as far as possible peel off the nests, which may be found quite readily after one becomes acquainted with the small brown patches, almost like a piece of chewing gum, squeezed around the young shoots; for any that may be overlooked we find the best method is to go at them as soon as the small web is seen and strip them off by hand; this is the surest way to clean them and does not injure the trees like the asbestos torch or kerosene burners, which invariably leave a large half of the caterpillars, which drop from the nest when the heat is first applied. These of course increase and multiply, and it seems that New England roadside beauty will soon become a thing of the past if some means are not adopted to fight this scourge. I see some writers recommend cutting down the wild cherries; if this is done it will rob the poor birds of the one wild fruit they enjoy as much as the cultivated cherries and other fruits; this, of course, will drive them to eat our cultivated fruit, and along will come some one else and propose to destroy the birds, and so it goes. I find that the caterpillars will readily adapt themselves to other foods after they have eaten up all the wild cherry foliage near any given spot, so after the wild cherries are destroyed they will soon find some other shrub or tree to devour in the same manner, and where will it end? Naturally we shall have to destroy all vegetation if we intend starving the caterpillar. I believe the control is simple if the effort is made, but it must be made by all property owners at the same time. When the Gypsy Moth arrives in large numbers this will have to be done or every green thing will be eaten and our beautiful woodlands will be as bare in July as in December. It seems strange that it is so hard to convince people of this fact who havve not seen large colonies of the Gypsy Moth caterpillar at work.

#### Our Native Birds' Protectorate

Under the Direction of the Committees on Bird Preservation and Propagation.
National Association of Gardeners, L. H. Jensen, St. Louis, Mo., Chairman.
American Association of Park Superintendents, Hermann Merkel, New York, Chairman.

#### BIRD PROTECTION FOR EDUCATION AND PLEASURE.

By L. P. Jensen,\* Missouri.

John Evelyn, in his introduction to his "Kalendarum Hortense or the Gard'ners Almanac," published in

London, 1664, says:

"There is not amongst Men a more laborious life than is that of a good Gard'ners; but a labour full of tranquillity, and satisfaction; Natural and Instructive, and such as (if any) contributes to Piety and Contemplation, Experience, Health and Longaevity. In sum, a condition it is, furnish'd with the most innocent,

laudable and purest of earthly felicities."

I believe this applies in equal measure to the gardener of today, particularly to the one who takes full advantage of the various studies required to make him efficient in his profession. The daily contact with nature prevents monotony, and the many new problems in the various lines of study, which constantly appear, to be solved must make our profession a labor of pleasure. An efficient gardener must keep his mind and eye always open to the constantly changing conditions and surroundings.

He must not only know the plants which he grows, cultivates or utilizes in his designs, but he must also know their requirements as to soil, moisture, light, heat and cold, the diseases which affect them, the insects which prey upon them, and those which are beneficial. He must know the form and height of plants at their maturity, whether their growth is rapid or slow, their flowering and fruiting period, and the color, texture and form of their foliage, etc.

He should combine the knowledge of a botanist, an engineer, a chemist, an entomologist and an ornithologist before he may be considered an efficient

all-around gardener.

In the pursuit of these studies he is brought out in the open, healthful air and sunshine, his faculties of observation are becoming more and more keen as he progresses, and the pleasure of new discoveries multiplies and adds to his eagerness for more knowledge.

I believe that if all gardeners could be made to realize and see the many pleasures that might be derived through the pursuance of these studies, essential to our profession, the standard of our proficiency might be raised materially.

To convince you of how much real fun and pleasure there is to be derived out of just one small part of the gardener's study and work, I will take just a few moments of your time to again call your attention

to the subject of bird study and protection.

While the work of protection and propagation of our native birds is a work of national importance, and a work which is given considerable attention by the national government, many state and national organizations, Audubon societies and numerous individuals throughout the country for its economic importance, it is at the same time a work which each individual gardener should engage in for the pleasure and enjoyment which he might derive therefrom.

I know of very few persons who do not admire the beautiful plumage of the cardinal, bluebird or oriole,

or who do not enjoy the wonderful melody of the bobolink, meadow-lark or mocking-bird. Have you ever tried to induce the birds to make their home and rear their broods in your garden or near your home? Do you realize the fun and the pleasure that you and your family and friends might derive from getting better acquainted with our feathered friends? If not, then just try, and you will be richly rewarded.

Now is the time of the year when time might be found for the making of boxes and houses needed to induce many of these valuable and interesting friends

to come and stay with you next summer.

Send for a copy of Farmers' Bulletin No. 609, "Bird Houses and How to Build Them," published and distributed by the United States Department of Agriculture, Washington, D. C., and get busy making homes and shelters for the blue-bird, robin, chickadee, tufted titmouse, nuthatch, wrens, dipper, swallows, martins, song sparrow, house finch, phoebe, flycatcher, flicker, woodpeckers, etc. If you have children, get them interested, let them make and hang their own boxes according to instructions given in this bulletin. Make and put up food shelves at once for the winter birds, supply these shelves with seeds, grain and suet. and be sure to have an abundant supply of fresh water in shallow basins for the birds to bathe and drink. See to it that these receptacles are placed so that cats will have no opportunity to kill the birds, or better, kill the cat if he disturbs the birds. In early spring, place bits of twine, wool and feathers where the birds may find and use them for building their

Having thus prepared yourself for their arrival, and in the meantime derived a lot of pleasure in the good work of preparation, you are ready to receive your guests. The birds will quickly perceive the advantage of accepting your hospitality, as the necessities for their propagation are at hand. You will watch with interest their busy work of making their nests, and when the eggs are hatched and the feeding of their youngsters becomes an arduous performance for the birds you will soon observe, and with a great deal of pleasure I am sure, what a wonderful amount of noxious insects are devoured by a nestful of young birds in a given time. And while you are having no end of fun and gaining valuable first hand information on the life history of birds, the birds are protecting your plants from destruction by insects.

As your interest in the birds increases you will begin to relate your experiences and your fun to your neighbors and friends, and your children will induce other children to take up the work, and the boy who formerly got the birds with a gun will take pleasure in

protecting them from their enemies.

While preparing for the coming of the birds next spring you should write to the secretary of the National Association of Audubon Societies, 1974 Broadway, New York City, who will be glad to advise you as to what literature to procure for helping you in your study.

After studying the life of the birds near your home and having through this experiment become an ardent champion for their protection, you will begin to give some of your spare time to the study of the birds of the fields, woods and meadows in your vicinity. You will soon learn what a close inter-relation exists between the birds, the insects and plants. You will find the birds are the guardians of the woods by their untiring and ceaseless hunting for insect food materials.

Each species of birds seems to be particularly adapted to a certain kind of work and to keep a check on certain species of insects. Some birds, like the woodpeckers and flickers, work on the trunks and branches of the trees, others on the twigs and leaves. The busy quail and the meadowlark work among the grasses of the fields and meadows and the towhee and others in

the shrubby undergrowth.

By studying the habits of our native birds first hand you will probably revise your opinion as to the economic value of some of them. You will probably find that some of the birds which you have formerly condemned for robbing you of a few grains or some fruit, really are paying for this many times over by the noxious insects which they consume; and you will also learn from this study that by planting wild fruit-bearing trees and shrubs you might give these birds a fruit diet without any trouble or cost, and you will find that an intelligent study of this kind will lead you to encourage masses of native growth on your premises for the protection of the birds and the orchard. This study will carry you still further into the field of investigation and you will become interested in the preservation of our native plants for the pleasure and protection they will afford yourself as well as the birds. Economic ornithology is the study of the value of birds as counted by dollars and cents, and it is very convenient and helpful to the cause of the preservation and propagation of our native birds that we can prove that their protection means the saving of money. It should not be necessary, however, to use this low standard as a means of interesting the American gardeners on this subject.

The gardener should know that his profession, while in most cases not the most remunerative, is the most interesting, instructive and healthful of all professions, full of open-air life, sunshine, flowers, and not

to forget, birds.

When the gardeners generally come to realize this, then there will be no need of urging them to come forward with a helping hand in the work of preservation and propagation of useful birds, and their work in this direction will be nation-wide and effective.

In conclusion I wish to say that this paper has been written as an appeal to the individual member of the National Association of Gardeners to give his personal attention and support to this movement, not alone because it is worth while from an economic point of view, but because there is no more interesting chapter in the book of nature than that one given to the fascinating study of bird life.

#### CHARITY AND PRUDENCE.

"The contradictions of life are many," said the philosophic clubman. "Recently I came upon a drinking fountain in a public park which bore two conflicting inscriptions. One, the original inscription on the fountain, was from the Bible: 'And whosoever will let him take the water of life freely.'"

"Above this hung a placard: 'Please do not waste the water." - Exchange.

#### GARDEN CLUB OF ALLEGHENY COUNTY, PA.

The annual meeting of the Garden Club of Allegheny County was held on Friday afternoon, November 26, at the home of Mr. and Mrs. Finley Hall Lloyd, near Shields, Sewickley, Pa. The election of officers for the coming year was held, resulting in the following: Mrs. Lloyd, president; Mrs. James D. Hailman and Mrs. W. Henry R. Hilliard first and second vice-president, respectively, and the re-election of the old Board of Managers composed of Mrs. Lloyd, Mrs. Hailman and Mrs. Hilliard, Mrs. Benjamin Franklin Jones, Jr., Miss Alice Blaine Robinson, Mrs. James Stuart Brown, Mrs. George Breed Gordon, Mrs. William Larimer Jones, Mrs. Richard Beatty Mellon, and Mrs. William H. Mercur. The club, which now has a limited membership of one hundred, is contemplating the extension of the same. Owing to the approaching holidays there will be no more sessions until January.

#### HORTICULTURAL SOCIETY OF WESTERN PENNSYLVANIA.

The new Horticultural Society of Western Pennsylvania met for its first regular semi-monthly session on Wednesday evening, December 1, in the East Liberty Branch of Carnegie Library. Superintendent William Allen of the Homewood Cemetery, the first vice-president, reported a representative visit to the recent annual meeting of the Garden Club of Allegheny County, resulting in the accession of sixteen associate members from the latter to the new organization at five dollars per member, this list promising to be shortly extended. Thomas Edward Tyler, the secretary, who is in charge of the orchid houses of Charles D. Armstrong, had an interesting display of cypropediums in variety. This was supplemented by a talk on the culture of orchids. Tyler's exhibition included some fine types of Sanderea, to which he devotes one house, and two specimens of hybrid cattleyas. Huyler, the chrysanthemum grower for the Phipps Conservatory, West Park, North Side, contributed a display of twelve late varieties, single and pompons. In connection with this he mentioned that the single varieties were usually pinched too late in the season, thus precluding the desired long stems.

The meeting was also devoted to a display of decorative Christmas plants and a talk on Christmas decorations by one of the leading down-town florists. The first session of 1916—January 5 -will include a discussion on the advisability of holding the first

annual chrysanthemum show next autumn.

#### PENNSYLVANIA STATE HORTICULTURAL ASSOCIATION.

The annual meeting of the State Horticultural Association of Pennsylvania will be held at Reading, Pa., on January 18, 19 and 20. An interesting program will be mailed out the latter part of December. Phases of fruit and vegetable growing of interest to all horticulturists and farmers will be taken up by lecturers. Discussions will follow by growers and members of the association. An interesting feature of the meeting will be the question box which will be opened at each session, and the discussion led by one of Pennsylvania's prominent growers.

F. N. FAGAN.

Assistant Secretary, State College, Pennsylvania.

#### MASSACHUSETTS HORTICULTURAL SOCIETY.

A meeting of the Board of Trustees of the Massachusetts Horticultural Society was held on Saturday, December 4.

The special committee on the award of the George Robert White Medal of Honor for the year 1915 reported the name of Ernest Henry Wilson.

The following standing committees of the society for the en-

suing year were appointed:
Finance—Walter Hunnewell, chairman; Arthur F. Estabrook, Stephen M. Weld.

Membership R. M. Saltonstall, chairman; Thomas Allen, Thomas Roland.

Prizes and Exhibitions-James Wheeler, chairman; John K. M. L. Farquhar, Duncan Finlayson, T. D. Hatfield, A. H. Wingett. Plants and Flowers-William Anderson, chairman; Arthur H.

Fewkes, S. J. Goddard, Donald McKenzie, William Sim. Fruits-Edward B. Wilder, chairman; William Downs, Ralph

Vegetables-John L. Smith, chairman; Henry M. Howard, William C. Rust.

Gardens-Richard M. Saltonstall, chairman; David R. Craig, Jackson T. Dawson, William Nicholson, Charles Sander.

Library—Charles S. Sargent, chairman; Ernest B. Dane, Nathaniel T. Kidder.

Lectures-Wilfrid Wheeler, chairman; John K. M. L. Farquhar,

F. C. Sears, Fred A. Wilson. Children's Gardens-Henry S. Adams, chairman; Wm. N. Craig,

Dr. Harris Kennedy, Mrs. W. Rodman Peabody, Miss Margaret A. WM. P. RICH, Secretary.

<sup>\*</sup>Read before convention National Association of Gardeners, Boston, December 9.

#### **NATIONAL ASSOCIATIONS**

National Association of Gardeners. M. C. Ebel, secretary, Madison, N. J.

Society of American Florists and Ornamental Horticulturists.

John Young, secretary, 54 West 28th st., N. Y.

American Carnation Society. A. F. J. Bauer, secretary, Indianapolis, Ind.

Chrysanthemum Society of America. Charles W. Johnson, secretary, Morgan Park, Ill.

Women's National Agricultural and Horticultural Association.

Miss Margaret Jackson, secretary, Englewood, N. J.

#### LOCAL SOCIETIES

Bernardsville Horticultural Society.

W. G. Carter, secretary, Bernardsville, N. J. Commerce Rooms. First Monday every month, Horticultural Hall, 7:30 p. m., Bernardsville, N. J.

Boston Gardeners' and Florists' Club. William N. Craig, secretary, Brookline, Mass.

Third Tuesday every month, Horticultur-al Hall, Boston, Mass., 8 p. m.

Cleveland Florists' Club.

Frank A. Friedley, secretary, 95 Shaw avenue, East Cleveland, Ohio. Second Monday every month, Hollenden Hotel, Cleveland, Ohio.

Cincinnati Florists' Society.

Alex. Ostendorp, secretary. Cincinnati, Ohio.
Second Wednesday every month, Jabez Elliott Flower Market.

Connecticut Horticultural Society. Alfred Dixon, secretary, Wethersfield, Conn. Second and fourth Fridays every month, County Building, Hartford, Conn., 8 p. m.

Detroit Florists' Club.
R. H. Wells, secretary, 827 Canfield avenue,
Detroit, Mich.

Third Monday every month, Bemb Floral

Dobbs Ferry Gardeners' Association. B. Harms, secretary, Dobbs Ferry, N. Y. Last Saturday every month.

Dutchess County Horticultural Society. Herbert G. Cottan, secretary, Wappinger Falls, N. Y.

May and June, Poughkeepsie, N. Y.

Elberon Horticultural Society.

George Masson, secretary, Oakhurst, N. J. First Monday every month, Fire Hall, Elberon, N. J., 8 p. m.

Essex County Florists' Club. John Crossley, secretary, 37 Belleville avenue, Newark, N. J.

Third Thursday every month, Kreuger Auditorium.

Florists' and Gardeners' Club of Holyoke and Northampton, Mass.

James Whiting, secretary, Amherst, Mass Second Tuesday every month.

Florists' and Gardeners' Club of Rhode Island.

William E. Chapell, secretary, 333 Branch avenue, Providence, R. I. Fourth Monday each month, Swartz Hall.

Gardeners' and Florists' Club of Baltimore. N. F. Flittin, secretary, Gwynn Falls Park, Sta. F, Baltimore, Md.

Second and fourth Monday every month. Florist Exchange Hall.

Gardeners and Florists of Ontario. Geo. Douglas, secretary, 189 Merton street, Toronto, Canada.

Third Tuesday every month, St. George's Hall.

The Horticultural Society of New York. Geo. V. Nash, secretary, Bronx Park, New York Čity.

Monthly, irregular, May to October, New York Botanical Garden, Bronx Park, New York. November to April, American Museum of Natural History, 77th st. and Columbus ave., New York.

Houston Florists' Club.

A. L. Perring, secretary, 4301 Fannin street, Houston, Texas.

Meets first and third Monday, Chamber of

Lake Geneva Gardeners' and Foremen's Association.

Raymond Niles, secretary, Lake Geneva, Wis.

First and third Tuesday every month, Oct. to April; first Tuesday every month, May to Sept., Horticultural Hall.

Lenox Horticultural Society.

John Carman, secretary, Lenox, Mass. Second Wednesday every month.

Los Angeles County Horticultural Society. Hal, S. Kruckeberg, secretary, Los Angeles. Cal.

First Tuesday every month.

Massachusetts Horticultural Society. William P. Rich, secretary, 300 Massachusetts avenue, Boston, Mass.

Menlo Park Horticultural Society. Percy Ellings, secretary, Menlo Park, Cal. Second Thursday each month.

Minnesota State Florists' Association. Gust, Malmquist, secretary, Fair Oaks. Minneapolis, Minn.

Third Tuesday every month.

Monmouth County Horticultural Society. Harry Kettle, secretary, Fairhaven, N. J. Fourth Friday every month, Red Bank.

Montreal Gardeners' and Florists' Club. Second Wednesday every month except W. H. Horobin, secretary, 283 Marquette st. First Monday every month.

Morris County Florists' and Gardeners' Society.

Edward J. Reagan, secretary, Morristown, N. J.

Second Wednesday every month, except July and August, 8 p. m., Madison, N. J.

Fourth National Flower Show, under the auspices of the Society of American Florists and Ornamental Horticulturists, Philadelphia, Pa., March 25 to April 2, 1916.

International Flower Show, Grand Central Palace, New York, April 5-12, 1916.

vention, Boston, December 9-10, 1915.

#### MENLO PARK (CAL.) SHOW.

The annual fall flower show of the Menlo Park Horticultural Society, held in the public school, Menlo, was described by everyone who saw it as the best ever held by the society. In every respect it was much better than the flower show held at the Horticultural Palace, P. P. I. E., San Francisco, the previous week.

W. Johnson, secretary of the Chrysanthemum Society of America, who was one of the judges at our show, in conversation with the writer, after judging, said it was a wonderful show.

Competition was very keen, and the quality of the flowers and plants could not be beaten.

Silver cups and cash prizes were donated to the society by the following trade firms: C. C. Morse, San Francisco; Halliwell's Seed Store, San Francisco; F. R. Mills, florist, Palo Alto: Lynch Nursery Company, Menlo Park; H. L. Goerteyhain, Redwood City; F. Park; H. L. Goerteynam, Redwood City; P. Pellicano, San Francisco; Arthur T. Boddington, New York; Aphine Manufacturing Company, Madison, N. J.: Lord & Burnham Company, New York; Henry A. Dreer, Philadelphia; Shreeve, Treat & Eacret, San Francisco; Hawaiian Fertilizer Company, San Francisco.

In the open to all classes the Lynch Nursery Company were the principal winners, getting 13 first, 6 seconds and the soelety silver cup. F. R. Mills, 8 firsts, 3 seconds. H. L. Goerteyhain, 1 first, 2 seconds.

Private gardeners only, D. Bassett was the largest winner, with 9 firsts and 3 seconds. The Aphine Manufacturing Company, silver vase for the most meritorious exhibit by a member of the N. A. A. The Henry A. by a member of the 8, A, A. The tierry A. Dreer cup for the best 24 blooms chrysanthemums, the N. G. A. medal for the best 12 chrysanthemums, Lord & Burnham's prize for decorative and foliage plants, and the Shreeve, Treat & Eacret cup for best table of orchids. Mr. Basset is gardener for Mr. L. Stern, a gentleman who takes a great pride and interest in his garden and greenhouses. Mr. G. Munn, gardener for Mr. Sigmund Stern, won the Halliwell cup for the best collection of vegetables and several other prizes for separate dishes of vegetables and chrysanthemum classes.

Mr. D. Patterson, gardener for C. W. Smith, with 4 firsts and 3 seconds, was a successful exhibitor, winning first for the largest bloom in the show with a wonderful bloom of Wm. Turner.

Mr. W. Kettlewell, gardener for G. Pope, won the C. C. Morse Company's special prize for best 12 dishes of vegetables and 4 other firsts for separate dishes of vegetables.

Mr. J. M. Daly, gardener for J. Leroy Nickel, swept the boards in the fruit classes. His greenhouse grown grapes were very fine. Mr. Daly also won first for best 12 vases single chrysanthemums out of 10 entries and first for best 50 blooms of double tuberous begonias.

Mr. A. McDonald, gardener for the San Mateo Commission, P. P. I. E., was a successful winner in the plant classes, winning 4 firsts with ferns, chrysanthemums and flowering plants.

Other principal winners were Mr. D. W. Slade, gardener for S. M. Spaulding; D. Tuttle, gardener for Mrs. Heller; H. Wright, gardener for Mrs. Oyster: C. Ehrlich, gardener for Mr. G. Roos; E. Carter, gardener for Mr. Walters; H. Homewood, gardener for F. W. McNear; C. Lampard, gardener for J. A. Donahoe.

The judges were: S. Clark, Mayfield; T. National Association of Gardeners, constitution, Boston, December 9-10, 1915.

Sandifortt, San Rafael; H. Platt, San Francisco; E. James Elmhurst and C. W. Johnson, Chicago.

PERCY ELLINGS, Secretary.

#### HARTFORD (CONN.) SHOW.

The officers and members of the Connecticut Horticultural Society were much pleased and gratified at the success attending their efforts to hold a Chrysanthemum Show. This show was held on Friday, November 12. When the Chairman of the committee in charge of the exhibition requested one member of that committee to endeavor to secure the old City Hall, for many years the historical State House (also known as the famous Bulfinch Building), he entertained little hope of having his ambition gratified; and when he announced that he had met with success and that the Chrysanthemum Show was to be held in this grand old building, every member of the society was greatly and pleasantly surprised. The hallway and the stairway on each side were beautifully decorated with palms and 'mums, of all kinds and sizes, groups of pompons and a very attractive exhibit of seedlings of anemone flowered 'mums of special merit. The private gardeners and growers very kindly contributed to the success of the show by bringing the best they had, and the committee wishes to thank the exhibitors through the columns of the Chronicle for their whole-hearted response to make the show the best ever given by the society. It is conservatively estimated that some 10,000 visitors viewed the exhibition on the above date. There were no premiums offered at this show, although a number of diplomas were awarded by the judges appointed to pass on the merits of the exhibits. The society is proud that it was the first organization in this city to demonstrate for what purposes the old City Hall could be used for the entire benefit of the citizens of Hartford.

John F. Huss, superintendent of the James J. Goodwin Estate, was awarded a first-class certificate for specimen plants. He exhibited three large vases of white, yellow and pink 'mums in the mayor's reception room for which a certificate of merit was awarded. A first-class certificate was also awarded his collection of potted plants and

potted pompons.

Alfred Cebelius, gardener for Professor Melanthon W. Jacobus, received a first-class certificate for specimen plant. This plant of R. F. Felton, yellow, attracted a great deal of attention, bearing some 300 blooms. Other plants exhibited by him were Dr. Enguehard, containing some 150 pink blooms, and Lady Lydia, white, the plant being trained fan shape. A striking novelty shown by Mr. Cebelius was the Reine Du Japan, a peculiar white bloom with petals like pine needles. He also staged vases of Ophelia, Mrs. Aaron Ward, Mrs. Charles Russel, Hadley and Radiance roses, for which he was awarded a first-class certificate.

Fred Boss, gardener at Elizabeth Park was awarded a first-class certificate for cut blooms, and also for potted plants. The south side of the lobby was beautifully decorated by the Park Department, for

which Hartford is famous.

The palms and ferns displayed by A. N. Pierson, Inc., of Cromwell, were rare specimens for size and perfection in growth, and gave the general outline of the exhibition a finishing touch that could not be surpassed by anything else. A table of cut roses came in for their share of praise, especially the new "Red Radiance" rose, which is very similar in color to American Beauty. Both these exhibits were awarded first-class certificates by the judges.

George H. Hale, gardener for W. E. Sessions of Bristol, was awarded a first-class certificate for seedlings of anemone flowered mums of special merit. This exhibit created quite a discussion among some of

the visitors, as they were completely at a loss to name it. He also received a certificate of merit for cut blooms.

Warren S. Mason, superintendent of the A. A. Pope Estate, Farmington, was awarded a certificate of merit for general display.

The chrysanthemum display of Elmer D. Smith, of Adrian, Mich., was awarded a

first-class certificate.

The staging of the various exhibits was under the direction of G. H. Hollister, superintendent of Keney Park. Mr. Edward A. Brassill, manager for W. W. Hunt & Co., was chairman of the committee in charge of the exhibition, and through his untiring efforts the show was a grand success.

ALFRED DIXON, Secretary.

#### OYSTER BAY HORTICULTURAL SOCIETY.

The regular monthly meeting of the Oyster Bay Horticultural Society was held in Fireman's Hall, Oyster Bay, on November 24, 1915.

Mr. John Sorosick reported the "'mum"

show a great success.

Mr. John T. Ingram reported the lecture given by Dr. Felt at the Oyster Bay High School recently a great success.

The following were elected to active membership: Messrs. Geo. Wilson, Geo. Walker, Charles Moulti, Charles Valentine, Charles

Young and William Ritchie.

The exhibition tables were well filled, and prominent among the exhibits was Mr. Robinson's collection of vegetables, of which there were twenty-nine varieties. The following were appointed Judges: Messrs. Milburn, Gale and Hothersall and reported as follows: 3 heads lettuce, Joseph Robinson, society's prize: 50 violets, Prince of Wales, George Wilson, society's prize; seedling chrysanthemum, J. Bell, certificate of merit: collection of vegetables, J. Robinson, cultural certificate.

Mr. James Bell gave an interesting talk on his new type of 'mum to' be known as the Cactus type.

A lecture on "Hickory Bark Beetles," etc., was given by Mr. J. J. De Vyver. Exhibits for next meeting are 1 pot

Exhibits for next meeting are 1 pot primula, 1 pot schizanthus, 12 mushrooms.

A. R. KENNEDY, Secretary.

#### NEW LONDON HORTICULTURAL SOCIETY.

New London Horticultural Society held its annual election of officers for the coming year Thursday, December 9, in the Municipal Building, State street. After the reading of the minutes by Secretary John Humphrey the retiring president, Alfred Flowers, then appointed S. L. Ewald, Edward Smith and John Maloney a nominat. ing committee, to appoint new officers These gentlemen retired for a brief session and appointed as follows: For president. Donald Miller; first vice-president, Gustav Newmann; second vice-president, Ernest Robinson; treasurer, S. L. Ewald; financial secretary, W. J. Morgan. Secretary John Humphrey did not wish for re-election, as his duties in connection with city affairs keep him going that he asked to be relieved of the office. Stanley Jordan was appointed in his place.

The society now has a membership of 125 members and a balance of \$150 in the treasury, which is very gratifying to the mem-

bers in general.

Rising votes of thanks was given Alfred Flowers for his untiring efforts as president during the past year. Mr. John Humphrey also for his seven years' service as secre-Both gentlemen very feelingly retarv. sponded.

STANLEY JORDAN, Secretary.

#### NASSAU CO. (N. Y.) HORTICULTURAL SOCIETY.

The regular monthly meeting of the Nassau County Horticultural Society was held in Pembroke Hall, Glen Cove, December 8, at 2 p. m. President Westlake in the chair. Mr. George Wilson, of Jericho, was elected to active membership. The president appointed as judges of the exhibits Messrs. James Holloway, George Wilson and James McCarthy, and they made the following awards: For the best plant of Gloire de Lorraine, 1st, Frederick Hitchman; for the best vase of carnations, 1st, Robert Jones. Mr. Jones also exhibited a splendid vase of chrysanthemums. Odessa, for which he was awarded a cultural certificate.

This being the annual meeting, Treasurer Ernest Brown read his financial report for the year just closed, showing that the society is in a first class condition financially. Mr. Brown received a very hearty vote of thanks from the society for the very efficient manner in which he carried out the

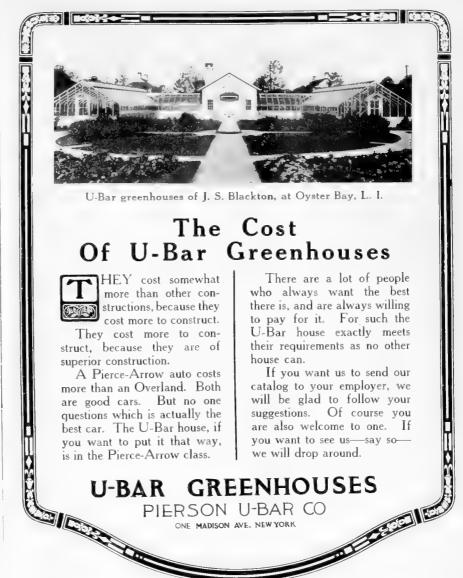

duties of his oflice.

The election of officers for the coming year now being in order, President Westlake, after cordially thanking his fellow members for the harmonious co-operation which he had received from them during his term of office, appointed Mr. James Duthie as chairman to conduct the election. The following officers were elected: President, McDonald; vice-president, Joseph Adler; treasurer, Ernest Brown; secretary Harry Jones; corresponding secretary, James McCarthy; trustee, Ernest Westlake. Executive Committee—Robert Jones, John Johnstone, Arthur Cook, James Gladstone. August Fournier, Walter McKinley and Thomas Twigg.

The newly elected officers were installed by Mr. Duthie, and Mr. McDonald then took the chair and conducted the remainder of the meeting. It was decided to hold our annual dinner on January 25, and a committee composed of Messrs. Ernest Brown. Joseph Adler and James Duthic was appointed by President McDonald to make

full arrangements for same.

JAMES M'CARTHY, Corresponding Secretary.

#### TURAL SOCIETY.

This society held its regular fortnightly meeting on December 2 in the Odd Fellows Hall. There was a good attendance of members, with the president, Mr. Mac-Laughlin, in the chair. The talk of the eve-ning was on "Sweet Peas Under Glass," when Mr. McLeod, superintendent to Mrs. Horace Russell, gave the members present some very interesting points on their culture. Mr. McLeod has proved to be a very skillful cultivator of these charming winter flowers. The next meeting will be held on December 16 at 8 p. m.

S. R. CANDLER.

Hitchings of Company

General Offices and Factory-ELIZABETH, N. J.

NEW YORK 1170 Broadway BOSTON 40 Federal S

KEDYKEKEKEKEK

PHILADELPHIA 40 S. 15th St. Science is teaching that it is as essential to

#### PROTECT PLANT LIFE

from insect pests and the various fungi with which it is afflicted as it is to properly fertilize it. The importance of this to successful cultivation is becoming more and more evident as more is learned about the growth and habits of vegetation.

a concentrated liquid spraying material, readily soluble in water, is used at various strengths, according to directions on cans.

Aphine is equally effective in the house and garden; free from disagreeable odors of most insecticides, and practical for professional and amateur growers.

It is effective against green, black and white fly, thrips, soft scale, rose cabbage and currant slugs, and other soft bodied and sap-sucking insects. It can be applied to the tenderest foliage, flowers, fruits and vegetables.

Aphine will keep your plants (sweet pea vines, rose bushes,

etc., etc.) in the garden free from insects.

**Aphine** is used by prominent growers as a wash for decorative stock.

Gill, 25c.; half pint, 40c.; pint, 65c.; quart, \$1.00; gallon, \$2.50.

is an oil and sulphur composition—three in one, a scalicide, insecticide, and fungicide combined, composed of a high grade of petroleum, and the properties of the well known fungicide, Fungine. It is a most efficient winter spraying material for San Jose and other scale.

Use one part Scaline to twenty parts water.

As a summer spray for hardy trees, shrubs and plants it is an effective remedy against green, black and white fly, red spider, thrips, woolly aphis, cottony maple scale, tulip scale, mealy bug, and all soft scale. Use one part Scaline to forty to fifty parts water.

The sulphur contained in Scaline makes it an excellent preventive against various fungi at all

seasons of the year.

Scaline will rid your evergreens and shrubs of the red spider pest, which has done so much

havoc to them recently.

For summer spraying, Scaline is recognized as a marked improvement over the old-fashioned kerosene emulsion; more effective and more economical. It mixes readily with water, contains no sediment, and can be applied with the finest spray nozzle.

Quart, 75c.; gallon, \$1.50; 10 gallons, \$10.00.

is a concentrated sulphur composition, used as a spraying material, readily soluble in water, containing no sediment, and, unlike Bordeaux mixture, and lime and sulphur, does

not stain the foliage, but cleanses it.

It is an infallible remedy for mildew, rust and wilt, affecting flowers, fruits and vegetables, and is used with much success by leading growers on young stock as a preventive against various blights; also against bench fungi. One gallon makes 50 gallons spraying material.

Half pint, 30c.; pint, 50c.; quart, 75c.; gallon, \$2.00.

is a soil sterilizer and vermicide. Destroys cut, wire, eel and grub worms, maggots and root lice. Used one part to four hundred parts water, thoroughly soaking the

ground, it will protect your plants and lawns against ravages under the soil.

Gill, 25c.; half pint, 40c.; pints, 65c.; quart, \$1.00; gallon, \$3.00.

These products have the endorsement of leading commercial and private growers, and are generally recognized as standard remedies for the control of the insects and plant diseases for which they are recommended.

For sale by the leading seedsmen throughout the country. If not obtainable in your community, send us your order direct and we will have it shipped to you from our nearest agency.

# The three vital features of your Christmas Grafonola

For, of course, your new instrument will be a Columbia, if it is a question of musical quarty of certainty of lasting enjoyment. Judge the superiority of the Columbia Gratonola, first of all, upon its superb tone.

#### Tone:

The result of the state as the homodone, and the sense of the sense does, and the sense does, are the sense of the sense as a part to be represented in the process. The perfect tell reproduct and the annual tell following achievement in this branch of the art.

Once you realize the tone possibilities of the Columbia Grafonola, plaving Columbia Records or any other records, we believe you will never again be satisfied with any tone lessfull and true, less brilliant and round and natural.

#### Tone control:

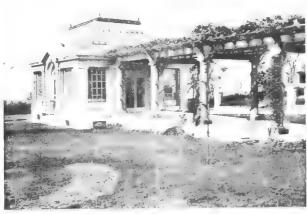

With the Columbia you have every possible gradation of tone at your command. The tone-control leaves, built on the one right principle of controlling tone-volume, and the wide variety of needles available, give you any and a blegrees of tone volume, from the lightest planissimo to the resounding fortissimo to fill the largest auditorium.

#### Convenience:

Your Grafonola, equipped with the individual record ejectors, an exclusive Columbia feature, is ideal in its convenience. Your records are racked individually in velvet-lined slots that automatically clean them and protect them against breaking and sorat rang. A numbered push button controls each record—a push of the button brings at y record forward to be taken etwer, it is a barbon of

COLUMBIA

#### The Glass Enclosed Gardens of a Prominent Society Leader

THOSE of you who have followed the blue ribbon winning of the Horse Shows, are familiar with this season's accomplishments of Miss Loula Long with her dashing tandem, Revelation and Hesitation. Located at Longview, her father's beautiful estate near Lee's Summit, Mo., are the training stables.

From here you catch a glimpse of the greenhouse containing seven separate glass gardens with flowers and fruits to supply both the country and town houses.

In pleasing harmony with the refined elegance of the Kansas City house, is a wistaria covered Pergola with a semiclassic palm garden at one end, and a plant garden with gracefully curved roof at the other.

From here come many of the palms and numerous foliage and flowering plants used so lavishly for their social functions.

It was our privilege to erect the glass gardens at both the town and country houses
